Series Preface

No anthologist succeeds in including everyone's favorites, so a few words about the principles of selection seem appropriate. Firstly, as with other volumes in this Garland series, priority has been given to journal articles, rather than book chapters. However, some essential book chapters have been included, and the introductions to each volume include references to significant books. Readers in search of further bibliographical assistance should consult what is now the standard source: Karl H. Potter, *Bibliography of Indian Philosophies*, 3rd rev. ed. (Delhi: Motilal Banarsidass, 1995), and the on-line updates to it available at the "Indian Philosophy Bibliography" (http://faculty.washington.edu/kpotter/). Secondly, the emphasis throughout is on *philosophical* studies of Indian philosophy. Consequently, much excellent historical and philological work has been omitted. Thirdly, the desire to make Indian philosophy accessible to interested Western philosophers has meant not only that all the selections are in English, but also that most of them use a minimal amount of unglossed Sanskrit terminology. This restriction has prevented the inclusion of more work by Indian authors.

Finally, I would like to acknowledge gratefully all the good advice and generous assistance I have received from Chakravarthi Ram-Prasad, Mark Siderits, and (most especially) Stephen Phillips. The blame for any shortcomings that may remain rests, of course, solely upon my own shoulders.

Series Introduction

The five volumes of this series collect together some of the most significant modern contributions to the study of Indian philosophy. Indian philosophy is one of the great philosophical traditions of the world. Unfortunately, however, its philosophical riches are not always as readily accessible to Western philosophers as might be desired. The selections in these volumes help to redress this situation by giving readers easy access to some of the best philosophical work in the area, including material that is often difficult to locate.

Collectively the selections in these volumes explore many of the important commonalities and differences between the Indian and Western philosophical traditions. These similarities and differences are philosophically pregnant. There is enough in common between Indian and Western philosophy to suggest that the philosophers in both traditions are often engaged with similar problems and hence should be able to communicate with each other. However, there are also sufficient differences between the traditions to suggest that they may have some novel perspectives to offer each other.

In choosing the selections for this series priority has been given to journal articles, rather than book chapters. However, some essential book chapters have been included, and the introductions to each volume include references to significant books. The emphasis throughout is on *philosophical* studies of Indian philosophy. The desire to make Indian philosophy accessible to interested Western philosophers has meant not only that all the selections are in English, but also that most of them use a minimal amount of unglossed Sanskrit terminology.

Volume 1: Epistemology is concerned with the nature and scope of Indian *pramāṇa* theory, i.e. that part of Indian philosophy concerned with the nature and sources of knowledge. Indian philosophers developed a causal theory of knowledge and acknowledged the existence of a number of valid ways of knowing, including perception, inference and testimony. The Indian *pramāṇa* theorists thus discussed many issues that have also

occupied Western epistemologists, often offering importantly different perspectives on these matters. They also sometimes addressed various interesting questions about knowledge that are unfamiliar to Western epistemologists.

The selections in this volume discuss Indian treatments of epistemological topics like the means of knowledge, realism and anti-realism, truth, knowledge of knowledge, illusion and perceptual error, knowability, testimony, scepticism and doubt.

Volume 2: Logic and Philosophy of Language is concerned with those parts of Indian *pramāṇa* theory that Western philosophers would count as logic and philosophy of language. Indian philosophers and linguists were much concerned with philosophical issues to do with language, especially with theories of meaning, while the Indian logicians developed both a formalised canonical inference schema and a theory of fallacies. The logic of the standard Indian inferential model is deductive, but the premises are arrived at inductively. The later Navya-Nyāya logicians went on to develop too a powerful technical language, an intentional logic of cognitions, which became the language of all serious discourse in India.

The selections in this volume discuss Indian treatments of topics in logic and the philosophy of language like the nature of inference, negation, necessity, counterfactual reasoning, many-valued logics, theory of meaning, reference and existence, compositionality and contextualism, the sense-reference distinction, and the nature of the signification relation.

Volume 3: Metaphysics is concerned with the complement to *pramāṇa* theory, i.e. *prameya* theory. Whereas the *pramāṇas* are the means of knowledge, the *prameyas* are the knowables, cognisable entities that constitute the world. With respect to the number and kinds of such entities, there was a very wide variety of opinion among classical Indian philosophers — including variants of monism, dualism and pluralism about both entities and kinds. Many metaphysical topics were debated, but two of the most important were causation and the nature of the self. The competing theories offered about these two issues also raised other questions about the metaphysics of wholes and parts, substances and properties, and universals and particulars.

The selections in this volume discuss Indian treatments of topics in metaphysics like ontology, constructionalism, universals, negative facts,

mereology, causation, relations, freedom and determinism, and theories of the self.

Volume 4: Philosophy of Religion is concerned with something that can be described as "Indian philosophy of religion," i.e. "philosophy of Indian religions." Contrary to popular Western belief, classical Indian philosophy was not indistinguishable from Indian religion — as even a cursory glance at the first three volumes of this series will demonstrate. Religious concerns, though, did motivate the work of many Indian philosophers. However, important differences between the major Western religions and the major Indian religions (Hinduism, Buddhism, Jainism) mean that the shape of Indian philosophy of religion is often significantly different from that of Western philosophy of religion.

The selections in this volume discuss Indian treatments of topics in the philosophy of religion like the problem of evil, God, theological monism and dualism, atheism, the concept of a perfect being, reason and revelation, rebirth and karma, religious language, religion and politics, ritual and *mantra*, and the religious determinants of metaphysics.

Volume 5: Theory of Value is concerned with Indian discussions in the areas of ethics, politics and aesthetics. The Indian philosophers had a good deal to say about the theory of value as they vigorously discussed topics like the ends of life and the relation of virtuous action to those ends. A traditional Hindu classification recognises four classes of values: *dharma* (morality, virtue), *artha* (wealth, power), *kāma* (pleasure), and *mokṣa* (liberation). *Mokṣa* is usually held to be the highest value and is extensively discussed in the paradigm Indian philosophical texts. Indian political and legal theory is concerned with the values of *artha* and *dharma*. Aesthetic pleasure is one of the subject matters of a developed body of writing on aesthetic theory. *Rasa* ("flavor"), the special feeling or enjoyment that pervades an artwork or is aroused in its contemplator, is commonly seen as detached from the aims and concerns of ordinary life, with some even suggesting that it provides a foretaste of the bliss of *mokṣa*.

The selections in this volume discuss Indian treatments of topics in the theory of value like the proper ends of life, the relation of *dharma* and *mokṣa*, liberation and pleasure, the sources of our knowledge of right and wrong, the ethics of non-violence, the status of the supra-moral, egoism and altruism, the theory of *rasa*, aesthetic experience and catharsis.

Volume Introduction

Classical Indian theory of knowledge is centered around *pramāṇa* theory (Chatterjee 1950, Datta 1960, Matilal 1986, Bhatt 1989). In Indian epistemology the *pramāṇas* are the *means* of knowledge, providing knowledge through modes like perception, inference and testimony. The *prameyas* are the knowables, cognizable entities which constitute the world. A *pramā* is a knowledge-episode and the relation between such a cognitive episode and its object (*prameya*) is structured by the *pramāṇas*. A *pramāṇa* provides both an authoritative source for making a knowledge claim and a means for (or way of) knowledge. In other words, a *pramāṇa* has a dual character: both evidential and causal. It provides evidence or justification for regarding a cognitive episode as a knowledgeepisode. But it is also supposed to be the most effective causal route to such an episode. Thus the theory of *pramāṇas* becomes both a theory of epistemic justification and a metaphysical theory of the causal requirements necessary for the validity of such justification. The *pramāṇas* are not simply justification procedures, but also those methods that match the causal chains with the justification chains so as to validate knowledge claims.

Indian philosophers vigorously debated the question of the number and nature of the *pramāṇas*. The Cārvāka admitted only perception as a valid means of knowledge, and accordingly rejected a belief in karma as unjustified. Vaiśeṣika and the Buddhists admitted both perception and inference as *pramāṇas*. Sāṃkhya allowed testimony as a third means. Vaiśeṣika added analogy (*upamāna*). Prābhākara Mīmāṃsā added presumption (*arthāpatti*) to these four. Bhāṭṭa Mīmāṃsā and Advaita Vedānta added yet a sixth source, non-cognition (*anupalabdhi*). Most agreed, however, that perception and inference are the most important sources of knowledge. Hence elaborate rival theories of sense perception and (especially) of perceptual error were developed, as well as sophisticated theories of inference.

All schools of Indian philosophy agreed that truth is a differentiating characteristic of knowledge-episodes (*pramā*). However, the various

schools differed as to their theories of truth (*pramātva* or *prāmāṇya*). Rival theories were offered not only about the meaning and criterion of truth, but also about the apprehension of truth (Mohanty 1989 and 1992, Chatterjee 1997). The central issue the theory of the apprehension of truth (*prāmāṇyavāda*) addresses is whether the truth of a cognition is apprehended intrinsically (*svataḥ*) or extrinsically (*parataḥ*): i.e. whether a cognition and its truth are apprehended together, or whether it is only through a second cognition that one apprehends the truth of the first cognition. (The Indian philosophers' concern with this question flows naturally from the *pramāṇa* theory's being a causal theory of knowledge; they wondered whether the originating conditions of a true cognition were in themselves sufficient for producing its truth.)

A traditional typology gives us Mīmāṃsā, Advaita and Sāṃkhya as all supporters of some variant of the theory of intrinsic truth-apprehension (*svataḥprāmāṇyavāda*) and Nyāya and the Buddhists as both supporters of the theory of extrinsic truth-apprehension (*parataḥprāmāṇyavāda*). Intrinsic theorists all agree that there is no *criterion* of truth, even if there are criteria of error. That is, since a cognition as such is true or apprehended as true, no criterion can *prove* its truth (even though a criterion of error may prove error to be error). Extrinsic theorists oppose these claims and insist that no cognition is true on its own account. Nyāya holds that the truth of a cognition depends upon its correspondence to reality; the Buddhist logician Dharmakīrti instead defines truth pragmatically in terms of "successful activity" (*arthakriyā*). Everyone accepts, however, that coherence and workability are at least marks of truth. Indeed presumably all parties could agree that the class of cognitions that, broadly speaking, lead to successful action and the class of cognitions that would be pretheoretically counted as "true" coincide extensionally. What is disputed is whether they coincide intensionally.

In discussing the idea that truth or falsity is extrinsically apprehended some Indian philosophers introduced the concept of a second-order cognition, i.e. a cognition which is itself the cognition of a cognition. Thus the question "How is the truth (or falsity) of a cognition determined?" is intertwined with the question "How is a cognition itself cognized?". With respect to the latter question Indian theorists hold either that a cognition is intrinsically cognized or "self-illuminating" (*svaprakāśa*) in that its very occurrence makes its own existence known, or that it is extrinsically

cognized only by a subsequent cognition (*parataḥprakāśa*). Variants of the self-illumination theory are upheld by Prābhākara Mīmāṃsā, Advaita, and the Buddhists; variants of the extrinsic cognition theory are upheld by Nyāya and Bhāṭṭa Mīmāṃsā.

This brief and partial sketch of the nature and scope of *pramāṇa* theory indicates both its similarity to and difference from Western epistemology. On the one hand, the Indian *pramāṇavādins* concerned themselves with many topics that have also occupied Western epistemologists: the nature and sources of knowledge, theories of sense perception and of perceptual error, the meaning and criterion of truth. On the other hand, there is also much in *pramāṇavāda* that is foreign to Western epistemology. In the Indian context, for instance, knowledge is treated as a species of awareness or cognition (*jñāna*), not of belief, and hence knowledge (*pramā*) is episodic, rather than dispositional. Doubt too is a cognitive episode or awareness, one which arises under certain specifiable conditions that do not allow for the possibility of meaningful foundational scepticism. Indeed many Indian philosophers are correspondingly sanguine about the limits of knowledge, often going so far as to identify the real with the knowable. The Indian epistemologists also often recognize independent sources of knowledge unfamiliar to Western epistemologists, including testimony (*śabda*), analogy (*upamāna*) and presumption (*arthāpatti*). Moreover, since Indian logical theory is primarily concerned with the nature of inference (*anumāna*) as an independent source of knowledge, it too falls within the scope of *pramāṇa* theory.

These important similarities and differences are philosophically pregnant. There is enough in common between Western epistemology and Indian *pramāṇa* theory to suggest that the philosophers in both traditions are often engaged with similar problems and hence should be able to communicate with each other. However, there are also sufficient differences between the traditions to suggest that they may have some novel perspectives to offer each other.

The selections in this volume explore some of these commonalities and differences. The opening paper by Mohanty presents a helpful overview of the general *pramāṇa* framework accepted by most Indian philosophers, stressing some of its important differences from Western epistemology. There is, however, one very important dissenter with respect to this general Indian consensus on the importance of the *pramāṇas*: the Buddhist

philosopher Nāgārjuna, who rejects the requirement that the Mādhyamika doctrine of emptiness (i.e. the doctrine that everything is empty of inherent existence) be grounded in the foundationalist framework of Indian *pramāṇa* theory. Trying to meet such a demand, Nāgārjuna argues, will lead either to a justificatory infinite regress, or to the incoherent notion of an inherently existent ground for our epistemic practices. Many have accordingly taken Nāgārjuna to be a sceptic (e.g. Matilal 1986), but Siderits argues instead that the motivation behind Nāgārjuna's critique of *pramāṇa* epistemology is a kind of antirealism. Nāgārjuna is not a sceptic trying to show the possibility of universal doubt. Rather he is rejecting as empty the assumption common to both realism and scepticism: that there is "one right fit" between beliefs and the world, to which we may or may not have epistemic access. Nāgārjuna is trying to show the incoherence of the very notion of a cognition or belief being true to the facts.

The concept of truth (*pramāṇya*) in Indian philosophy, especially in Nyāya and Mīmāṃsa, is elaborately discussed in the second selection by Mohanty, which offers a fourfold typology distinguishing intrinsic and extrinsic theories of truth-apprehension from intrinsic and extrinsic theories of second-order cognition (*prakāśa*). Katsura's piece usefully supplements Mohanty's by explaining the rather different approach of the Buddhist logician Dharmakīrti, who often favors a pragmatic account of truth in terms of successful activity (*arthakriyā*). Potter generalizes this pragmatic trend, arguing that (*pace* Mohanty) Indian epistemology does not concern justified true belief and that *pramāṇya* should be understood in Indian philosophy to mean *workability*, rather than truth. (For critical responses to this provocative suggestion see Mohanty 1984, Chakrabarti 1984.) The piece by Matilal presents the Indian debates about intrinsic and extrinsic theories of second-order cognition alluded to in Mohanty's fourfold typology, and fruitfully connects these with Western debates about knowing that one knows.

The selection by Bhattacharyya discusses Indian theories of perceptual error (see also Hiriyanna 1957, Potter 1963, Dravid 1996, Rao 1998). Illusion or error is a particularly serious problem for most (non-Buddhist) Indian philosophers because of their common commitment to epistemological realism, according to which the object of cognition can never be an totally unreal entity. Moreover the common Indian conviction that it is ignorance (*avidyā*) that causes us to be bound to suffering

generates theories of *metaphysical* as well as epistemological error. According to such theories liberation requires the correction of metaphysical error about our true nature and the true nature of the world. The understanding of epistemological error is then seen as a preliminary to the acquisition of this liberating metaphysical knowledge.

The treatment of illusion and error in Advaita Vedanta (discussed by Phillips and Ram-Prasad) is an instructive and influential instance of these trends. Advaitins hold that since *Brahman/ātman* alone is real, the everyday world is illusion (*māyā*). Our failure to see this is what binds us. But this illusion, like other perceptual illusions, then seems to require a (real) object of error. The developed Advaitin response is to argue that the object of illusion is neither real nor unreal (*anirvācanāya*). With respect to the existence of the external world, then, Advaita is neither realist nor idealist, but rather what Ram-Prasad calls "non-realist".

This Indian emphasis on the soteriological import of knowledge is usually coupled with a marked epistemological optimism about the availability to humans of the requisite salvationary knowledge. Nyāya, for instance, staunchly maintains the bold thesis that whatever exists is both knowable and nameable. The papers by Potter and Shaw explain the meaning of this striking claim, while Perrett argues that, given certain plausible assumptions, the Nyāya knowability thesis is demonstrably false.

As already noted, some of the Indian epistemologists recognize independent sources of knowledge not acknowledged by Western epistemologists. The most important of these is testimony (*śabda*), which is held by many to be a source of knowledge independent of perception or inference. This claim is likely to strike most Western epistemologists as decidedly odd, notwithstanding a recent revival of interest in the epistemology of testimony (Coady 1992, Matilal and Chakrabarti 1994). Chakrabarti's paper, however, argues for the philosophical defensibility of the Nyāya view that knowing by being told is not reducible to perceptual or inferential knowledge, nor to understanding followed by trust (see also Bhattacharyya 1998).

The Indian treatment of doubt as itself a species of cognitive awareness preempted the development of the kind of foundational scepticism central to the evolution of Western epistemology. Even those who count Nāgārjuna as a kind of sceptic about the *pramāṇas* do not maintain that he holds doubt to be anything like a foundational, or natural,

philosophical position, and similar remarks hold too for the "sceptical" writings of Jayarasi (Franco 1990) and Śrīharṣa (Granoff 1978, Phillips 1995). The final paper by Mohanty on the Nyāya theory of doubt helps explain why. According to Nyāya, everything can be doubted, provided that the specific causal conditions of the cognition called "doubt" (*saṃśaya*) are present. But the possibility of universal doubt Nyāya thus admits is a "motivated possibility", rather than a bare logical possibility. This is not the same as a Cartesian-style universal scepticism, built upon the premise that anything that is contingent is uncertain and hence doubtful. Since the Indians do not acknowledge this distinction between necessary and contingent objects or facts, for them nothing possesses any property that in itself makes it liable to be doubted. Meaningful doubt requires that suitable *epistemic* conditions are satisfied, and radical Cartesian-style universal scepticism is ruled out as in pragmatic contradiction with everyday practical life.

J. N. Mohanty   **A fragment of the Indian philosophical tradition— Theory of *pramāṇa***

I

There are two ways in which one may look critically at a tradition: from within or from the outside. In this article, I intend to do it the first way. Raising the sort of questions that I will be asking already implies a certain estrangement from that tradition, but at the same time I do so not in order to find the faults or limitations which may characterize it, but with a view to continuing and creatively advancing the traditional modes of thinking. Living outside the country where that tradition developed and still has deep roots, and exposed to a powerful and temporally and culturally more relevant mode of thinking, one runs the risk of being an over-hasty, shallow, and even arrogant critic of a long and hallowed tradition. One gathers the illusion of being free, free from all tradition, and thus justified in critiquing one's own. But if that sense of freedom is illusory, this critique is superficial. If the critic claims to be free from all traditions, he will be forgetting what Gadamer has so poignantly reminded us: that he will be thinking from within a new tradition, for example, the tradition of (modern) rationalism.

In talking about the Indian philosophical tradition, I will be referring to the Indian *darśanas*, the classical philosophical schools—and only indirectly to the scriptures from which those schools derive their ideas and motivations. This decision, justified by usage of antiquity, leaves us with a less ambiguous discourse to reflect upon, and makes it possible to avoid many familiar pitfalls. Talking about Indian philosophy, it is not uncommon, for example, to insist that Indian philosophy is deeply spiritual, that its goal is not simple intellectual jugglery, but spiritual transformation of one's nature, that philosophy is a means to the attainment of *mokṣa* or spiritual freedom. Such large claims are, to say the least, highly misleading; in a familiar construal, they may even be false. The following remarks may

partly clear the way for a more fruitful reflection on the nature of Indian philosophy.

In the first place, there is no doubt that the *Upaniṣads* exhibit a strong spiritual motivation: knowing the *ātman* is said to bring about an end to worldly sufferings and a state of spiritual freedom (whatever the latter may mean). It is a frequent mistake not to distinguish between the spirituality of the *Upaniṣads* and the alleged spirituality of the *darśanas* even when the latter trace their ideas and doctrines back to the *Upaniṣads*. Secondly, *thinking* about spiritual matters is not itself spiritual. To assert this is not to degrade such thinking, but only to reiterate its nature quâ thinking. Quâ thinking, it may be thorough or superficial, adventurous or conventional, logically rigorous or lacking in rigor, critical or creative—but neither spiritual nor nonspiritual. Consider an analogous point: thinking about perception is not itself perceptual. Another thing often lost sight of by those who argue for the spiritual character of the *darśanas* is that, although the *darśanas*, at least some of them, recognize *sábda* as a *pramāṇa* or means of true knowledge, they do not *eo ipso* identify *sábda* with experience of some sort. This matter about which the philosophical tradition had great clarity is misconstrued by those who want to argue that recognition of *śabda* as a *pramāṇa* is tantamount to according to the spiritual experiences of the "seers" an authoritative status. I will return to this confusion later. The same sort of confusion characterizes such clichés as that the Indian philosophies make use of intuition rather than intellect. Quite apart from the fact that the uses of "intuition" and "intellect" are many and muddled, I wish to remind those who revel in such clichés that none of the *darśanas* uses a *pramāṇa*, which suffers a rendering into that much misused word "intuition."

Without belaboring my point any further, let me turn to the positive characterizations that I intend to submit. I will divide my remarks into three groups: those concerning *pramāṇa* or means of true cognition; those concerning *prameya* or objects of true cognition; and the overall *status* of the theory, its *aim* and its relation to other sorts of inquiry.

II

A philosophical theory needs not only to elaborate a view about the nature of things, but also to back up this account with a theory of evidence,

rational justification, and critical appraisal. It needs not only to *use* evidence, rational justifications, and critical appraisals, but also to have a theory of those theoretical practices. It needs to have generalized answers to such questions as: when is a cognitive claim valid? What sorts of evidences are acceptable in adjudicating the validity of a cognitive claim? What sorts of justifications of beliefs are acceptable? In critically appraising rival claims, what criteria are admissible? Where there are conflicting criteria, what are their relative strengths and weaknesses? These are the tasks to which the *pramāṇa* theory addresses itself. It is a singular sign of the high level of intellectual sophistication of the *darśanas* that they all, at some time or other in the course of their development, came up with their theories of *pramāṇa*.

As is rather well known, these theories differed not alone with regard to the definition of *pramāṇa* (and the implied concept of *pramā*, that is, true cognition), but also with regard to the number of *pramāṇas* and their specific natures. My purpose here is to draw attention to some striking features that emerge in these discussions, and which throw some light, however dim, on the Indian concept of rationality.

To begin with, let us note an important difference in locution, which, however, is not a mere matter of locution, but points to deep substantive issues. In the Western philosophical tradition, it was usual, until recent times, to ask: does knowledge arise from *reason* or from *experience*? The rationalists and the empiricists differed in their answers. These answers, in their various formulations, determined the course of Western philosophy. In the Sanskrit philosophical vocabulary, the words 'reason' and 'experience' have no exact synonyms, and the epistemological issue was never formulated in such general terms. On the other hand, a question which was asked (and which is likely to be mistaken for the question just raised in the Western tradition) is: is perception the only *pramāṇa* or is *anumāna* a *pramāṇa*? Neither is 'perception' synonymous with 'experience', nor '*anumāna*' with 'reason'. Those who recognized perception as a *pramāṇa* (in fact, every philosophical school did so) often did not restrict perception to sensory perception, and did not restrict sensory perception to the domain of sensible qualities, such as color, and material objects, such as sticks and stones. Among things that were taken to be sensuously perceived are: the self and its qualities, such as pleasure, pain, desire and cognition; universals, such as redness; natural-kind essences, such as cowness; and

relations, such as contact and inherence (of a quality in a substance; of a universal in its instances). That *anumāna* or inference is different from reason (of the rationalists) is clear from its very etymology; it follows upon perception. If we leave the Buddhists out, no school of Indian philosophy ascribed to inference a 'constructive' role. It knows what can be known otherwise. There is always a priority of perception. There are no Indian rationalists. Neither perception nor inference pointed to any specific faculty of the mind—as 'experience' and 'reason' did in classical Western philosophies. The same faculties or cognitive instruments—operating in different manners—resulted in one case in perception, in another in inference.

I have belabored this point in order to caution against any temptation to see in the *pramāṇa* theories near kins of the Western epistemologies. The preceding remarks lead to another feature of the *pramāṇa* theories. A *pramāṇa* is the specific *cause* of an irreducible type of *pramā* or true cognition. There are two different sorts of reason why a particular *pramāṇa* is not recognized by a certain school. One reason is that the sort of cognition which it causes is just not true cognition: this is the reason why some Buddhists would not regard inference as a *pramāṇa*: for an inferential cognition apprehends its object as an instance of a universal rule and not in its uniqueness, and so is not true to its object's own nature. But one may give a quite different sort of reason why a putative *pramāṇa* is not really one. When the Vaiśeṣikas deny that *śabda* or words can serve as a *pramāṇa*, they do not deny that the putative linguistically generated cognition is true; what they insist upon is that it is not of an irreducible variety, that as a matter of fact it is reducible to inference. There are thus *three* claims made by a *pramāṇa* theory: (1) some cognitions are true, that is, *pramā*; (2) some of these true cognitions belong to a type that is irreducible to any other type; and (3) true cognitions belonging to such an irreducible type are caused by a unique aggregate of causal conditions.

Thus, a sort of causal theory of knowledge is built into the *pramāṇa* theory:[1] a true cognition must not only be true to its object (*arthāvyabhicārin*), but must also be generated in the right manner, that is, by the appropriate causes. Expressed in a modern philosophical style, this amounts to saying: *S* knows that *p* if *S* has a cognitive state having the form '*p*' if this cognitive state is true, and if it is brought about in the right sort of way.

This last formulation in terms of a cognitive state leads me to the third feature to which I would like to draw attention. Western thought has been torn not only by the conflicting claims of reason and experience, but also, at least since Descartes, by the dualism of mind and matter, the subjective and the objective. One of the offsprings of the latter distinction is the distinction between the private and the public. In more recent philosophy this has emerged as the problem of psychologism. Epistemology and theory of logic have been haunted by the specter of psychologism, and have sought to banish all reference to the inner mental states from their discourse. The consequence has been pure objectivism—be it of the Platonic sort or of the physicalist sort. Contrasted with this, the Indian epistemologists have made unabashed use of 'mentalistic' discourse, and have never quite worried about the problems of psychologism, private language, and so forth. It is possible to accuse them simply of uncritical naïveté. But given the heightened critical acumen which they exhibit, the reasons have to be sought elsewhere. It is well known that for most Indian philosophers, mind (if that is how *manas* is to be translated) is rather a subtle form of *prakṛti* or matter, a nonconscious inner sense organ, but not a domain of private experiences. Cognitions and other experiences belong to the self, *ātman*, and can be 'perceived' only by their owner (if self-manifesting, then so only to the owner). But if *S* alone has an inner perception of his experience, it does not follow that none else can *know* them by any of the *pramāṇas* other than perception. What is more, these episodes, even if belonging to a particular owner, have their ideal intentional contents, which numerically distinct episodes, belonging to different owners and occuring at different temporal locations, can have in common. I have shown elsewhere how, given this conception of "mental episodes," one is enabled to construct a logic of cognitions with appropriate logical rules for inference. To talk about a cognitive event, then, need not arouse the specter of psychologism.[2]

I referred earlier to the causal story that pervades the Indian epistemologies. It is now possible to look at it more closely. Possibly since Kant, it has been usual to distinguish sharply questions of epistemic justification (*quaestio juris*) from questions of causal origin (*quaestio factis*). It is only in more recent times that a causal theory of knowledge has come very much into vogue, but the causal theories of knowledge have to be able to find room for justificatory concepts such as logical validity and

truth. In this regard, the Indian epistemologies can serve as a useful model. As B. K. Matilal has insisted in his recent book on perception, the *promāṇas* serve both as causes and as justifications of cognitive episodes.[3] It seems to me that this was made possible by first separating out noncontroversial instances of true cognitions from such instances of nontrue cognitions, and looking, at the same time, for (1) the marks that distinguish the former from the latter, and (2) the distinctive causal conditions which produce the former and not the latter, and, finally, combining (1) and (2) in the definition of *pramāṇa*. In the case of the theories which regard truth as *svataḥ*, the causal conditions producing cognitions (of a certain type) and those producing *true* cognitions (of that type) coincide.

Causal theories are regarded as being notoriously reductionistic, and therefore suspect for the logician-cum-epistemologist. Not so in the Indian tradition, which regarded them as being descriptive and compatible with the uniqueness of cognitions and their claim to truth. There are two aspects of this liberalism: for one thing, the reductionist causal laws are physicalistic and oriented to the prevailing physical theory, while the causal laws used by the Indian epistemologists are formulated in terms of such heterogenous elements as physical contacts, revived memories, and desires to have a certain sort of knowledge, for example—if needed, even activation of traces of past *karma* and the ubiquitous passage of time. Secondly, such a causal story is not explanatory but descriptive, for it is formulated in a way that wishes to adapt the story to the intuitive needs of a cognitive event rather than to submit to the constraints of an available physical theory. The general constraints were rather those of a large *ontological* theory.

As regards *pramāṇa theory*, I will make only two more comments before passing on to the *prameya* theory, that is, ontology. These two remarks will concern *anumāna* (or inference) and *śabda* (word), in that order.

Much has been said, in the secondary literature, of the fact that the Indian theory of *anumāna* is psychologistic (it tells a story about how inferential cognition arises) and nonformal (it requires an instance where the universal major premise is satisfied). Both characterizations are right, but unless correctly understood they are likely to mislead. I have already said how psychology and logic were reconciled in Indian thought. The theory of inference is a good illustration of this position. The rapprochement between psychology and logic was done by logicizing psychology as well as by psychologizing logic: the former by assuming that the psychological

process of reasoning conforms to the logical (any seeming deviance, as in supposedly fallacious reasoning, being due to misconstrual of the premises); and the latter by making logic a logic of cognitions rather than of propositions. It is not that the Indian theory of *anumāna* does not know of formal validity. In fact a formally valid mood can be abstracted from a valid Nyāya *anumāna*. But since the interest was in cognitions (and not in either sentences or in propositions), and in *anumāna* as a *promāṇa*, as a source of *true* cognition, the merely formally valid inference, as in *tarka* or counterfactuals, was left out of consideration.

This brings me to *śabda* or 'word' as a *pramāṇa* or source of true cognition. It is really here that the true foundation and the deeper roots of the Hindu tradition lie. The mere recognition of *śabda* as a *pramāṇa* is itself a novel feature of the Indian epistemologies. The Western epistemologies recognize one or more of the following sorts of knowledge: perception, reasoning, introspection, and memory. Many, in more recent philosophy, have come to emphasize the decisive role that language plays in shaping our knowledge. But to the best of my knowledge, no one recognizes language—or verbal utterance—as a means by itself of acquiring knowledge about the world. And yet how much do we know simply by hearing others, by reading books and so forth, not to speak of the religious and moral beliefs that we derive from perusal of the scriptures? The Indian epistemologies consequently recognized *śabda* (that is, hearing the utterances of a competent speaker) not only as a *pramāṇa*, but as *the* decisive source of our cognitions about all those matters that transcend the limits of possible sensory experience.

To bring out some peculiarities of the thesis of *śabda-pramāṇa*, I would like to emphasize the following points.

First, *śabda*, as a *pramāṇa*, is not a mere word, but a sentence—and that, too, is not a written, but a spoken sentence. There is undoubtedly a priority of the spoken and the heard over the written.

Secondly, with regard to language learning, most Indian theorists emphasize imperative sentences rather than indicative sentences. The sentence utterances are primarily—if not exclusively—to give orders, to suggest courses of action to be undertaken or avoided, and so forth, and not to state facts.

Thirdly, in their theory of meaning (both of words and of sentences), most Indian theorists have subscribed to a pure referential theory and do *not*

have a concept of sense as distinguished from reference. (Since I made this diagnosis two decades ago, several people have tried to show where to look for such a theory of sense. Most convincing of these attempts is by Mark Siderits. While Siderits is right in tracing a sort of sense theory to the Buddhist *apoha* theory, I think my general diagnosis is correct.) A direct referential theory permits the theory of *sabdapramāṇa* to collapse the distinction between understanding and knowing. While translations of empty expressions like "hare's horn" à la Russell abound in the Nyāya literature, the real stumbling block before the theory is to have some reasonably acceptable account of what it is to *understand* a false sentence. *Śabdapramāṇa* must be—even for the Naiyāyika, if they are to be consistent—*intrinsically* true. False sentences cannot generate any understanding (*śābdabodha*), not to speak of *pramā*. But, of course, on the theory, *śabdabādhā* and *śabdajanyapramā* are the same! The enormous problems that this identification generates are all too obvious.[4]

Fourthly, there is one area of knowledge where the claim of *śabda* to be an irreducible *pramāṇa* is strongest: this is the domain of what ought and ought not to be done. If factual truths may possibly be established either by perception or by reasoning of some sort, our only source of knowing what ought and ought not to be done—it may reasonably be claimed—is verbal instruction, written or spoken, by moral teachers, elders, or scriptures.

Finally, there is a large claim, supporting the tradition like a rock, that *sruti*, that is, the sacred, the heard, scriptures (the *Vedas* and the *Upaniṣads*) are *apauruṣeya*, that is, not composed by any human author. This gives them a freedom from possible fault, an incorrigible authority that no text with human authorship could support. I will return to this concept of 'apauruṣeyatva' at the end of this article.

III

What sort of theories of *prameya*, of possible objects of true knowledge, did the Indian philosophers hold? Given the great variety of ontologies—ranging from the pluralism of Nyāya-Vaiśeṣika to the monism of Advaita Vedānta—what can be done at this point is to draw attention to some salient features of those ontologies.

The first thing to be noted is that these ontologies do not countenance any abstract entity of the sorts that ontologies in the West admit. Among the familiar abstract entities, we have Fregean senses (for example, propositions), numbers, and universais. I have already said that, in my view, full-fledged Fregean senses are not to be found. Numbers are reduced to properties (*guṇas*) of sets. Universais, although common, are not the sort of rarefied entities amenable only to the grasp of pure reason, which characterize them in the Western metaphysical tradition. They are rather more concrete entities, perceived through the same sense organ by which their instances are. Nor are there pure unactualized possibilities. It is not surprising that these last creatures are absent, for their habitat in the Western metaphysical tradition, God's mind, does not play that role of creating *out of nothing* in Indian thought. In the absence of *possibilia* and of abstract entities such as propositions, some standard concepts of necessary truth and its opposite contingent truth just cannot find any formulation in the Indian systems. Thus, we have accounts of what the world does consist of, but not of what might have been or could not possibly not be. Recall that the standard formulation of *vyāpti* is extensional ("It is never the case that in all those loci where smoke is present, fire is absent"), but *not* modal ("It is impossible that …").

One reason why, in traditional Western metaphysics, the metaphysical scheme claimed a sort of necessity over and against those features of the world which the sciences study is that metaphysics and science have stood sharply separated ever since the beginning of metaphysics in Aristotle. Metaphysics, on this account, is concerned not with beings, but with being quâ being—the latter, that is 'being quâ being', being construed in various well-known ways (the highest being; the most general predicates or categories; the meaning of 'being'—to recall a few). For the Indian metaphysicians, science and metaphysics remain continuous. Both undertake to understand the structure of the world; they differ only in their order of generality. The Advaita Vedānta is the only exception in this regard: the world being unreal, on this theory, it is left to empirical science; and metaphysics, if that is what *parā vidyā*; needs to be called (which is indeed doubtful), is the knowledge of the one Being underlying beings.

If creation out of nothing, and so creation in the strict sense, has no place in Indian thought, that simply is not a marginal phenomenon for the *darśanas*, but—as I believe it can be shown—determines some very central

features not only of the Indian cosmologies, but also of the metaphysical notions of God, substance, time and, negation. Unfortunately, I cannot undertake an investigation of that problem on this occasion.

IV

In this last and concluding section, I would like to make a few remarks on the *pramāṇa-prameya* structure in its entirety, that is, on the philosophical enterprise as illustrated in the *darśanas*. While engaged in highly sophisticated philosophical activity, the Indian thinkers did not explicitly and self-consciously focus on the nature of their enterprise. It is generally in response to the skeptical challenges of a Mādhyamika that sometimes they would, while defending their enterprise, remark on the nature of what they would be doing. Without going into textual details, let me state some of the main issues.

1. The Mādhyamika critique is not merely a critique of the epistemology, but also a critique of the ontology. The critic insists on their mutual dependence. You cannot decide what the *pramāṇas* are unless you have decided what things there are to be known. And you cannot settle this latter question unless you have, at hand, the means of knowing. Where, then, do you begin? If the circularity cannot be broken, why not give up the entire enterprise?

2. The *pramāṇa-prameya* theorist's response to this challenge has been, in brief, that it presupposes an unnecessarily strong reading of the unity of the two parts of a *darśana*. There is no one-to-one relation between a *pramāṇa* and its *prameya*. One and the same thing can be known by more than one *pramāṇa*. One and the same system of ontology can be made to go together with different epistemologies: consider the Nyāya and the Vaiśeṣika. The mutual dependence that threatens the relation between cognition in general and object in general is broken by specifying both and establishing a many-one or one-many relation between terms on each side.

3. What (2) entails is that a *darśana* is *not* a seamless unity such that parts of it cannot be taken out of the context of *that* system. My

interpretation goes against the traditionalist's view of it, which regards each *darśana* as a unique point of view. Among moderns, the Russian émigré, David Zilberman, (whose untimely death was a serious loss to the cause of Indian philosophy) held this holistic view of a *darśana*—which I reject here.

4. The reflective question of what sort of knowledge a philosophical system itself yields (or amounts to) and if it can itself be appropriated into one or more of the *pramāṇas* recognized by the system, is not explicitly asked, but the practice suggests that quite often it is the latter alternative that was chosen. The reason—already hinted at earlier—lay in not recognizing that philosophical knowledge is a knowledge that is, quâ knowledge, distinct from the sorts of knowledge that are thematized within the system. An alternative way out, which would consist in distinguishing between understanding and knowing (whereby philosophy yields understanding, but not knowledge), was not open —in view of the purely referential theory of *meaning*. When the Vedāntin says that knowledge of *brahman* brings about *mokṣa*, this knowledge is such that both the knowledge and the entity of which it is knowledge are thematized *within* the system. When the Nyāya *sūtra* says that knowledge of the sixteen *padārthas* brings about the highest good, what sort of cognition is it? Is it by one or more of the *pramāṇas*? The answer seems to be 'yes'.

5. Students of the *darśanas* often wonder from where did the early masters—the authors of the *sūtras* and *Bhāsyas*—derive that framework (the list of *pramāṇas* and *prameyas*) which the later authors went on refining. To say that they elaborated a way of *seeing*—using the verbal root '*dṛś*' (= to see) is *not* to assuage that anxiety. It is not in any case true that the later authors simply refined and clarified the framework suggested by the founding fathers. They also changed and modified it *within limits* (which also speaks against a strong holistic reading of the *darśanas*.) The more common response was to trace the framework back to the *sruti* (the heard texts with no human author). Consider the intellectual phenomenon that philosophical systems as diverse as Nyāya and Vedānta claimed affiliation with the *śruti*. How then should the nature of *śabdapramāṇa* be construed so that this paradoxical situation may be rendered intelligible? I suggest that for this purpose the nature of *śabdapramāṇa* as applied to *śruti*

be construed in a manner that is implicit in the tradition's understanding of itself but *not* explicitly formulated *as such*. And it is here that I differ from the orthodoxy in interpreting the role of *śruti* vis-à-vis the philosophies.

The *apauruṣeyatva* of *śruti* means, for me, neither that the texts are not composed at all (thus I deny its literal construction) *nor* that those texts express some supernormal, mystic experience. Not the first, for there is enough internal evidence that the texts were composed and also because the literal construal makes no sense. Not the second, for—in my view—sentences do not express experiences, but rather thoughts. This last thesis I would like to defend, but this is not the occasion to do so. Setting aside these two commonly held interpretations, I wish to suggest the following.

First, in understanding the *śruti* texts, it is utterly irrelevant and of no use to appeal to the *intentions* of their authors. The texts, the words themselves, are primary in the sense that they are available to us, and it is they that define for us the tradition. We use them to interpret our experiences, our world, and ourselves, and in doing so we also interpret those words themselves. Whereas orthodoxy ascribes to the words of the *śruti* what it takes to be *the* meaning, I leave open the possibilities of interpreting them. It is this plasticity of meaning, this endless possibility of interpretation, the continuing challenge they make to us, which sets the texts of the *śruti* apart from those of *smṛti*. They are foundational not because they express truths which are infallible, but because they define the parameters *within which* the Hindu philosophers asked questions, understood their concerns, and appraised their answers. In this sense, *śabda* (as *śruti*) is not itself a *pramāṇa*, but underlies the latter's applications. *Apauruṣeyaśruti* is not the supreme *pramāṇa*, infallible and raised above all the rest. It is rather the source of all those *concerns* and *inquiries* (not answers) in the solution of which the different *pramāṇas* exhibit their special philosophical relevance.

Who, then, is thinking within that tradition? My answer is that it is not necessary to be thinking within the tradition, to subscribe to any or all of the answers of the schools, but what is necessary is to share the *concerns* as sources of philosophical problems. I define the tradition, then, in terms of concerns, rather than in terms of beliefs.

NOTES

MARK SIDERITS

NĀGĀRJUNA AS ANTI-REALIST*

Matilal's recent work, *Perception: An Essay on Classical Indian Theories of Knowledge*, is a welcome addition to the growing body of works which seek not merely to explicate the theories and arguments of classical Indian philosophers but also to continue the philosophical conversation by examining such work in the light of the theories and methods of the current philosophical community. Matilal's subject is, broadly, the Nyāya defense of the school's realism about perception against its critics, chiefly the Buddhists and Mimāṃsakas. I shall here take issue with Matilal on just one aspect of this broad debate – the exchange between Nāgārjuna and Nyāya over the possibility of pramāṇavāda. I shall argue that Matilal misinterprets Nāgārjuna's position in this exchange, so that his Nyāya-style response misses the point of the Madhyamaka criticism. This is important not just for exegetical reasons, but because we should want to continue the discussion begun by these philosophers some 1800 years ago.

Matilal gives an account of Nāgārjuna's critique of epistemology in Chapter 2, and gives the Nyāya response in Chapters 2 and 5. The fundamental difficulty with this discussion lies in the fact that Matilal classifies Nāgārjuna as a sceptic. It is of course true that in *Vigrahavyāvartanī* Nāgārjuna denies the possibility of giving a coherent account of the pramāṇas or means of knowledge. But Nāgārjuna does not do this in order to show the possibility of universal doubt. Rather, his motivation is anti-realist: he seeks to show the impossibility of a theory of the pramāṇas in order to close off one common route to metaphysical realism.

The doctrine of metaphysical realism has three key theses: (1) truth is correspondence between proposition and reality; (2) reality is mind-independent; (3) there is one true theory that correctly describes reality. The Naiyayikas clearly subscribe to metaphysical realism, but classical

Sāṃkhya and the Abhidharma schools of Buddhism also fit this description. What is distinctive about Nyāya is the way in which pramāṇavāda is used as a foundation for the metaphysical realist's program. Matilal's book is a good illustration of this, for he discusses in great detail how the Naiyāyikas used their account of perception as a pramāṇa to support their realist views about the nature and structure of the physical world. In *Mūlamadhyamakakārikā* (where his opponent is typically an Ābhidharmika) Nāgārjuna uses *reductio* arguments against various metaphysical theories to undermine the third thesis of metaphysical realism. But in the pramāṇavāda section of *Vigrahavyāvartanī*, where his opponent is a Naiyāyika, he employs a different strategy. He seeks to show that justification is coherentist and not foundationalist in structure. He does this not to show that we can never have knowledge, but to demonstrate that the empirical world is thoroughly pervaded by *prapanca* or conceptual fabrication. If no theory of the pramāṇas can escape the faults of circularity or infinite regress, then any use of the accepted pramāṇas to construct a metaphysical theory must involve assumptions about the nature of reality and the nature of cognition which can only be justified in a coherentist fashion. Nāgārjuna's aim here is to undermine theses (1) and (2) of metaphysical realism. If he is right about the nature and structure of pramāṇavāda, then the notion of truth as correspondence between cognition and state of affairs becomes problematic, and reality comes to be seen as suffused with elements of mental construction.

These points require further elaboration. I shall begin by discussing Matilal's Nyāya-based attempts at answering Nāgārjuna's objections to pramāṇavāda. I shall seek to show that such attempts, based as they are on what I take to be a misinterpretation of Nāgārjuna's motivation, fail to vindicate the Nyāya project. From this there should emerge a clearer indication of the consequences for metaphysical realism of Nāgārjuna's critique of pramāṇavāda.

I have elsewhere discussed at some length Nāgārjuna's arguments against a theory of pramāṇas (Siderits, 1980). To briefly recapitulate, in *Vigrahavyāvartanī* 30–51, Nāgārjuna considers various responses to the question of foundations: how do we know that the various purported means of knowledge are in fact pramāṇas? Four possible strategies suggest themselves: (1) a pramāṇa establishes itself; (2) one pramāṇa is established by another pramāṇa; (3) a pramāṇa is established by its prameya: (4)

pramāṇa and prameya mutually establish one another. It is argued that (1) is question-begging, (2) involves an infinite regress, and (3) and (4) are viciously circular. Since (2) is the most intuitively appealing position for a realist, the chief concern of the Naiyāyika is to stop the regress that the question of foundations seems to engender. Matilal gives extended treatments of two such strategies.

One way in which Matilal seeks to stop the regress is brought out in his discussion (pp. 57–9) of the light example of *Vigrahavyāvananī* v. 33. Matilal construes this as an analogical argument: just as light illuminates itself, so a pramāṇa may establish (i.e., verify) itself. I would interpret it rather differently. It is widely assumed among Indian philosophers that an entity cannot operate on itself.[1] If this principle holds, then it follows that a pramāṇa cannot establish itself. The claim that light illuminates itself is intended to serve as a counter-example to this principle. If Nāgārjuna can show that this claim is false, then in the absence of any other alleged counter-example and in the presence of such positive evidence as the fact that a knife cannot cut itself, the principle will stand and we will be justified in rejecting the assertion that a pramāṇa establishes itself.

Matilal takes Nāgārjuna to argue that an object may be said to be illuminated only if that object may also exist in the unilluminated state. Since light obviously does not exist where there is darkness, light does not meet this condition. Hence it does not make sense to say that light is illuminated. I agree that this is Nāgārjuna's argument. But Matilal takes this to show that 'Light illuminates itself,' is a mere stylistic variant of 'There is light.' And this is merely another way of saving, 'There is illumination of objects,' since the occurrence of light and the illumination of objects are inseparable and thus may not be distinct events at all. But then if the opponent is taken as giving an analogical argument, his claim that a pramāṇa establishes itself is equivalent to the statement that a pramāṇa occurs, which in turn is equivalent to the statement that there is cognition of the object of knowledge. In this case the question, What establishes the pramāṇa? is misguided, for there is no distinct entity the pramāṇa: there is only the event, 'establishment of the object of cognition,' which may variously be referred to as the occurrence of a pramāṇa or as the cognition of a prameya.

This is an interesting strategy, but I do not think it succeeds. Here we need to answer two questions: (1) is it true that the occurrence of light is

nothing over and above the occurrence of illumination of objects? and (2) if this were true, would the analogy with pramāṇa go through? With respect to the first question, we can begin by pointing out that Nāgārjuna, common sense, and Nyāya are all quite leery of positing powers as distinct entities. The mutual-dependence arguments of MMK (e.g.. MMK III) often turn on just this feature. And common sense would, I believe, be loath to admit the existence of light in the empty space between earth and sun. (This is just how the 'If a tree falls in the forest' chestnut gets generated.) But the underlying principle at work here is just parsimony: we need not posit a power as a separate entity in order to explain the occurrence of some phenomenon if the only evidence for its existence is just the phenomenon whose occurrence is to be explained. Thus light would be a superfluous posit if the only evidence for its existence were the illumination of objects. But there is independent evidence for the existence of light (i.e.. electromagnetic radiation in the visible spectrum), for instance diffraction phenomena occurring with transparent media. Thus the occurrence of light and the illumination of objects are distinct events, and Nāgārjuna's point – that light does not illuminate itself – holds for just the reason that he gives: light is not the sort of thing that can meaningfully be said to be illuminated.

This yields a useful way of testing Matilal's strategy for avoiding the regress. Is there independent evidence for the existence of the pramāṇa as distinct from cognition of the object? Certainly there is. Some cognitions are veridical, others non-veridical. Many nonveridical cognitions are phenomenologically indistinguishable from veridical cognitions; the difference is revealed only in subsequent behavior. If this difference is to be explained, then it can only be in terms of distinct causal routes leading to the two sorts of cognition. And a pramāṇa is just that sort of causal route that typically leads to veridical cognitions. Hence even if it were true that light is nothing over and above the illumination of objects, we would still have good reason to speak of the pramāṇa as distinct from their result, the cognition of objects. Given this, moreover, Nāgārjuna's original question – How are the pramāṇa established? – is seen to be not only possible but pressing. This strategy will not stop the regress.

Matilal's second, more elaborate attempt to stop the regress involves the denial of the KK thesis – the thesis that in order to have knowledge one must know that one knows. In Chapter 5 he gives a careful explication of much of the Nyāya literature on knowing that one knows, including the

Naiyāyikas' discussions of the various kinds of cognition that may be used to establish the knowledgehood of a given cognition. He shows that the consensus position is this: while one may, if the need arises, employ some such method to prove that a given cognition is a piece of knowledge, one may perfectly well fail to do so and yet still possess knowledge. Matilal also seems to agree with the Naiyāyikas on this point. And surely this is right – if having knowledge is a matter of having a true belief with the right sort of causal ancestry, then one can have knowledge without knowing that one's belief has been produced by a reliable cause. Or, to put the matter somewhat differently, one can *be* justified in one's belief without being able to *show* justification.

What is surprising is that Matilal seems to think that denial of the KK thesis is an effective answer to Nāgārjuna's infinite regress argument. Matilal must then assume that Nāgarjuna implicitly accepts the KK thesis. And he assumes this, I would suggest, because he takes Nāgārjuna to be a sceptic. For if Nāgārjuna's infinite regress argument is to establish that we never have knowledge, then the KK thesis would seem to be required. Take, for instance, that version of the regress argument which claims that in order to establish that some particular cognition *j* is a pramāṇa, one must employ some distinct cognition *k*, which is itself a pramāṇa. But in order to establish *k*'s pramāṇahood, one must employ some distinct cognition *l*, etc. A sceptical reading of this argument would go roughly as follows: to be justified in taking the experience of seeming to see water as veridical, one must know that the causal factors responsible for this experience are an instance of the pramāṇa perception (because one must know that one knows in order to know). But one can know that these causal factors are reliable only through the employment of some distinct cognition. And then, once again, one can know that that cognition is itself the product of reliable causal factors only through yet another cognition, etc. Since this justificatory regress can never be ended non-arbitrarily, it follows that one can never know that this is water before me.

Nāgārjuna is not, however, a sceptic. Indeed Matilal expresses well Nāgārjuna's attitude toward knowledge and pramāṇavāda when he writes, 'The force of such arguments was to persuade us to recognize our philosophical activity, our pramāṇa doctrine, for what it is, a fabrication, a convenient myth-making or make-believe, the inherent value of which lies only in making day-to-day life work smoothly and rendering inter-

subjective communication successful' (p. 67). To say this is not to say that we might be radically deceived in all our beliefs about the nature of the world, that we might be wrong in all we think we know. Nāgārjuna would probably agree that we do have knowledge whenever the conditions articulated in the Nyāya account of the pramāṇas are met. (Candrakīrti explicitly affirms this at Prasannapadā p. 25.) His disagreement with Nyāya is not over the possibility of knowledge, but over the uses to which a theory of knowledge may be put. He sees that if a pramāṇavāda is to vindicate metaphysical realism, then justification must be foundationalist in structure. The point of the regress argument is just that justification is coherentist in structure.

How, after all, does Nyāya arrive at its account of the pramāṇas? I think the method they use is best thought of as one that seeks to achieve a kind of reflective equilibrium. We begin with a stock of basic beliefs that would share wide acceptance, and seek out the causal conditions that led us to have such beliefs. Having formulated a provisional account of the causal conditions for knowledge, we then look to see whether it accords with both our original stock of basic beliefs and with other beliefs we have about the world and about knowledge. If not, we make adjustments either in our account of the conditions for knowledge, or in our stock of intuitions, or both. This process continues until our account of the causal conditions for knowledge and our intuitions are in equilibrium, when no further adjustments need to be made. The resulting account of the causal conditions for knowledge is a theory of the pramāṇas.

Now Nāgārjuna would, I claim, hold that if such a procedure is carried out properly, then one would be justified in holding any belief that was induced through some causal route that was identified by the theory as a pramāṇa. Such beliefs would constitute knowledge. What Nāgārjuna denies is that such beliefs in any way 'mirror' or 'correspond to' a mind-independent existent. (See the commentary on VV 51.) Such beliefs may well deserve the title 'knowledge' – if we have engaged in the process of reflective equilibrium with sufficient care, then such beliefs will no doubt meet the tests of worldly practice. But we cannot then claim that a belief induced by one of the causal routes we have identified as pramāṇas corresponds to reality. This can be seen from the fact that, had we begun with a different stock of basic beliefs, or had we employed a different account of what counts as a cause of cognition, or had we assigned different

weights to our criteria of theory acceptance (parsimony, elegance, etc.), the results of our inquiry might well have been quite different – both in the account of the pramāṇas arrived at and in the stock of beliefs deemed warranted by those pramāṇas.

Now this may sound like a sceptical challenge, but it is not. It may sound as if the claim is that since we cannot know which of these schemes – the one we have arrived at, or one of the alternatives we might have arrived at under different assumptions – is correct, we do not in fact possess knowledge about pramāṇas and prameyas. But this is no more an argument to the effect that we might be radically and systematically deceived, than is Putnam's 'brains in a vat' argument. The point is rather that since, on any of the multiplicity of possible schemes that might be arrived at through the process of reflective equilibrium, our beliefs would accord with our practice, it follows that the notion of the 'one right fit' between beliefs and world is empty. Realist and sceptic share the common assumption that there is one right fit. The sceptic merely denies what the realist affirms about the possibility of our attaining (and knowing that we have attained) the one right fit. The anti-realist exploits the apparent deadlock between realist and sceptic in order to undermine the shared assumption. If under the best possible epistemic circumstances (reflective equilibrium) it still appears possible that we might be radically deceived, then we need to re-examine the notion of knowledge with which we began. And the problematic element in our account of knowledge does not lie in our account of justification – even if we deny the KK thesis, it is still open to the sceptic to object that knowledge cannot be a matter of pure luck. The problem lies rather in our account of truth as correspondence between belief and world. If there are any number of distinct sets of beliefs each having equal epistemic warrant, then the notion of a right fit between beliefs and world must be idle and useless. We can have no conception whatever of what it would mean for a cognition to correspond to the nature of reality.

Put more formally, the argument is as follows:

1. We have cognitions.
2. Not all cognitions lead to successful practice.
3. We seek to improve our chances at successful practice.
4. Hence we seek reliable (success-inducing) causes of cognition – those cognitions so caused we will believe, those not so caused we will not.

5. We can come to discriminate between reliable and unreliable causes of cognition only through the method of reflective equilibrium (MRE).
6. MRE requires that we begin with (1) a finite (and relatively small) set of 'world intuitions' (e.g., that water quenches thirst): and (2) a set of beliefs about what counts as a cause of cognitions, principles of theory-acceptance, etc.
7. Suppose that, having arrived at reflective equilibrium and thus constructed an account of reliable causes of cognition, we use this account to acquire a set S of beliefs about the world. We will then be inclined to suppose that the members of S are (at least largely) *true to the facts*.
8. But we might have begun with different members for (1) and (2).
9. And such differences might have led to a different account of the reliable causes of cognition, resulting in some alternative set S' of beliefs about the world (where S and S' are incompatible).
10. Because both S and S' were arrived at through MRE, each will equally well accord with our practice.
11. Hence there is no available method for deciding which of these two sets is more nearly true to the facts.
12. If there is no method for determining which of two incompatible sets of beliefs is more nearly true to the facts, then the notion that a belief is true to the facts is meaningless.
    Therefore while S may be epistemically warranted, it cannot be said to be true to the facts.

Two points are in order concerning this argument. The first is that the conclusion explicitly denies a thesis affirmed by both metaphysical realist and sceptic alike. This is the thesis that there is some set of beliefs that is true to the facts. The sceptic, of course, maintains that we can never know which beliefs belong to this set. But scepticism would lose all bite were it not to claim that there is some one way that the world is, and that we can imagine (though we cannot attain) possession of the set of beliefs that captures that one way. The present argument is that since we cannot imagine what it would be to possess the set of beliefs that is true to the facts, the notion that there is such a set is meaningless.

This brings me to my second point concerning this argument, which has to do with the verificationism found in (12). Verificationism has suffered

from somewhat of a bad press in recent times. But this is, I think, due chiefly to the unduly restrictive form of verificationism employed by the logical positivists. A less restrictive form – one that merely requires that there be *some possible* means of verification of a statement if that statement is to count as meaningful – is quite sound. For it reflects the intuition that the meaning of a statement is its use – the conditions under which the statement would be deemed assertible by the speakers of the language (See Dummett, 1978). Given this connection between meaning and use. it is plausible to suppose that if we are unable in principle to specify any situation that would count as verifying a statement, then that statement must be devoid of cognitive significance.

Nor is it implausible to attribute such a form of verificationism to Nāgārjuna. For verificationist elements can already be detected in early Buddhism, namely in the Buddha's treatment of the 'indeterminate questions'. There, not only are such questions as whether the world is eternal deemed pointless for the project of release from suffering. It is also pointed out that equally plausible inferences can be constructed for the claims that the world is eternal and that it is not, and neither claim is empirically verifiable. Thus such questions are not to be pursued because they are devoid of cognitive significance. We should not then be surprised to find Nāgārjuna making implicit use of some form of verificationism.

What this argument shows is that if we follow the Nvāva method of discovering the pramāṇas – the method of epistemological reflective equilibrium – then while employment of the thus discovered pramāṇas will yield beliefs with epistemic warrant, beliefs that may properly be called knowledge, it would be illegitimate to conclude that such beliefs correspond to the nature of reality. For we are quite simply unable to give content to this notion of correspondence between cognition and facts. And this in turn means that while we may well have a use for the expression 'the way the world is', we are likewise unable to give content to the notion of the way that the world is independently of our cognitive activity. In short, if the Nyāya method of establishing the pramāṇas is correct, then theses (1) and (2) of metaphysical realism are false.

There is another route to this conclusion as well, one which may better match the structure of Nāgārjuna's argument. The infinite regress argument seems designed to force the pramāṇavādin to concede that pramāṇa and prameya are mutually dependent – that the pramāṇas can be established

only by making certain assumptions about the prameyas, and the prameyas can be established only by making certain assumptions about the pramāṇas. We can see this feature at work in the method of reflective equilibrium: the basic stock of beliefs with which we begin represents a set of assumptions about the prameyas; and the views we hold concerning the criteria of theory acceptance and the manner in which cognitions are caused represent a set of assumptions about the pramāṇas. Now there is one sense in which such mutual dependence is not a fault but a strength. Not only does this seem to be the best that we can do; having an account of the reliable causes of belief that is arrived at through the method of reflective equilibrium actually seems to better our odds when it comes to attaining beliefs that make worldly practice go smoothly. But this feature of mutual dependence which is thus built into a theory of pramāṇas shows that it is impossible to prise apart the contributions of 'world' and 'mind' to those beliefs that we know to be true. The content of our knowledge is in part determined by human needs, interests, and institutions. This is not, once again, to say that those beliefs we take to be knowledge are somehow distorted by these 'subjective' elements. Since it is in principle impossible to attain cognitions which are not so determined, we can have no notion of what it would mean to have cognitions which were not 'distorted' in this way – in which case the concept of distortion loses all purchase here.

The situation may be likened to what results once we accept Quine's point about the analytic-synthetic distinction. Since all observation is theory-laden, we must give up the notion that there might be sentences whose truth-value was determined solely by meaning, or sentences whose truth-value was determined solely by the facts. To say this is not to say that within a given language there can be no distinction whatever between meaning and fact. What this does show is that the notion of an ideal language – a language whose semantic structure is isomorphous with the structure of reality – is empty. And it shows this precisely because it shows that it is impossible to completely prise apart the respective contributions of semantic structure and of experience to our beliefs about the world.

Nāgārjuna's point is likewise not that there can be no distinction between knowledge and error within a given set of epistemic practices. Nor is it even that there can be no improvement in the epistemic practices accepted by a given community. His point is rather that even when the pramāṇavādin's project has been carried out, the set of beliefs that are arrived at as a result

of this program cannot be said to mirror the nature and structure of a mind-independent reality. For we cannot give content to this notion of ideal correspondence between cognition and world unless we can be said to know the nature of the relata – cognition and world – in isolation from each other. The fact that pramāṇa and prameya are mutually dependent in the manner described above, shows that we can have no such conceptions of cognition and world. Thus we can have no idea what it means to say that our beliefs mirror the world. To say of a set of beliefs that they correspond to reality is to pay them an empty compliment. We would do better to say that they help make things go smoothly for us – that they cohere with other beliefs we hold, and with our needs, interests, and institutions. To say this is to say that such beliefs constitute knowledge.

Put more formally, the argument is as follows:

1. We have cognitions.
2. Not all cognitions lead to successful practice.
3. We seek to improve our chances at successful practice.
4. Hence we seek reliable (success-inducing) causes of cognition – those cognitions so caused we will believe, those not so caused we will not.
5. We can come to discriminate between reliable and unreliable causes of cognition only through MRE.
6. MRE requires that we begin with (1) a finite (and relatively small) set of 'world intuitions' (e.g., that water quenches thirst): and (2) a set of beliefs about what counts as a cause of cognitions, principles of theory-acceptance, etc.
7. Suppose that, having arrived at reflective equilibrium and thus constructed an account of reliable causes of cognition, we use this account to acquire a set S of beliefs about the world. We will then be inclined to suppose that the members of S are (al least largely) *true to the facts*.
8. (1) represents a set of assumptions about the world.
9. (2) represents a set of assumptions about the nature of belief.
10. Each belief in S is epistemically supported by those sets (1′) and (2′) whose members consist of the members of (1) and (2) respectively that survive MRE.
11. It is in principle impossible to arrive at S without employing both (1′) and (2′).

12. The epistemic support that each member of S receives from (1′) and (2′) is coherentist in nature.
13. Because of the nature of coherentist support, it is in principle impossible to distinguish between the epistemic support a member of S receives from (1′) and that which it receives from (2′).
14. We can say of some epistemically warranted belief that it is true to the facts only if it is at least in principle possible to distinguish between the truth-making contribution given that belief by the world and the truth-making contribution (if any) given that belief by the nature of our cognitive apparatus.

Therefore we cannot say of S that its members are (at least largely) true to the facts.

This argument also employs a verificationist principle, which occurs in premiss (14). To see how this premiss can be justified, consider an objection that the metaphysical realist might make: while we agree that justification is coherentist in structure, this fact does not by itself show that truth does not consist in correspondence to a mind-independent reality. For it is possible that truth 'outruns' justification. That is, while it may be in principle impossible to prise apart the respective contributions of world and the nature of cognition to the *justification* we have for believing some proposition p, it is still possible that what makes p *true* (supposing that it is true) is that p corresponds to the nature of reality.

The anti-realist response is to ask what it would mean to say that p is made true by the world. That is, under what possible circumstances would we be justified in asserting that p is made true by the world? We could be so justified only if we were able to assure ourselves that p belongs to S not by virtue of the nature of cognition but solely be virtue of the nature of the world. And by (13) we could never have such assurance. Thus while we might seem to have something quite definite in mind when we entertain the possibility that truth outruns justification, we are in fact unable to conceive of a situation that would verify the claim that p is made true by the world. Hence the claim is quite devoid of meaning.

Here it is helpful to consider what we do have in mind when we entertain the possibility that truth outruns justification. We know, of course, of cases where we take ourselves to be justified in denying some proposition p that we subsequently discover to be true. We likewise know of cases where,

while still accepting *p,* we now take ourselves to be better justified in accepting *p* than we formerly were. Both sorts of case may be accounted for in terms of the notion of improvements in our epistemic practices. And it is quite natural to say in either case that while *p* was true, we were not initially justified in accepting *p* (because of the epistemic practices we then employed). We must, though, resist the temptation to suppose that there might be true propositions which we would never be justified in accepting no matter what our epistemic practices. For when we seem to imagine this, we do so only by covertly smuggling in some cognizer (perhaps God) who is justified in accepting those propositions by virtue of that cognizer's epistemic practices. And once we bring this cognizer and those epistemic practices out into the open, the problem of (13) reemerges: if the method of reflective equilibrium is the best epistemological game in town, then what makes those propositions true is not their correspondence to the facts but their coherence with whatever count as the members of (1′) and (2′) for this cognizer. That is, we have not succeeded in imagining a situation in which truth outruns coherentist justification.

The argument is, then, that since on the Nyāya account of epistemoiogy pramāṇa and prameya are mutually dependent, the Naiyayikas must abandon either their theory of the pramāṇas or else their metaphysical realism. And since Nāgārjuna would agree with Nyāya that scepticism is untenable, while Nyāya pramāṇavāda would strike Nāgārjuna as basically sound in its approach, it is metaphysical realism that should be abandoned.

For some time now, there have been two competing interpretations of the Mādhyamikas. First there is the crypto-Vedāntin interpretation. according to which Nāgārjuna and his followers maintain that the ultimate nature of reality is ineffable and apprehensible only through some sort of non-discursive mystical intuition. According to the second interpretation, the Mādhyamika is to be taken at his word when he proclaims that emptiness is itself empty: his view is that the very notion of the ultimate nature of reality is a mere conceptual construction arising out of conventional linguistic practice. Matilal clearly adheres to the first interpretation. The sceptic accepts the metaphysical realist's thesis that there is such a thing as the ultimate nature of reality; he merely despairs of the possibility that we can ever have knowledge (at least discursive knowledge) of it. I, on the other hand, obviously take the second interpretation to be correct. To say that all 'things' are empty is just to make the anti-realist point that we cannot give

content to the metaphysical realist's notion of a mind-independent reality with a nature (whether expressible or inexpressible) that can be mirrored in cognition. Now textual evidence can be cited in support of either of these two interpretations. And it may well be that there is nothing in the Madhyamaka corpus that will by itself settle the issue. I suggest that in such cases we should look to other considerations in order to decide between competing interpretations – e.g., to the principle of charity. I would also suggest that interpreting Nāgārjuna as an anti-realist allows us to attribute to him a more coherent and defensible position than results from viewing him as a sceptic and crypto-Vedāntin. This in turn makes it possible for us to continue the conversation between Mādhyamika and Naiyāyika in a way that is not open to us if we see their debate as just another instance of the realist-sceptic stalemate. And surely this too is a desideratum.

NOTES

* In writing this paper I profited greatly from numerous discussions with Mark Timmons concerning anti-realism and the nature of justification.

INTRODUCTION

THE PURPOSE of this introductory study is to clarify the concept of truth in Indian philosophy, especially in the Mīmāṃsā and the Nyāya systems, and also to attempt a critical appraisal of the *prāmāṇya* theories. In both these respects the task before us is bewildering. Not much attention has been paid by scholars to a precise explication of the concept of truth in Indian philosophy. If we could throw some light on this and clarify the concepts, we could also to some extent clarify the amazingly complicated tangle of discussions that have grown up throughout the ages around the apparently simple question: Is *prāmāṇya svataḥ* or *parataḥ*? This is one of those questions to which every school worth the name came forward with an official answer. Arguments and counter-arguments were produced in never-ending stream. What we propose to do with regard to this vast mass of material at our disposal is in the first place to clarify the nature of the issue round which the theories centre, and then to examine the nature of the arguments that have been advanced by the different schools in support of their contentions. Since the primary purpose of this study is clarification of concepts, no attempt will be made here to take sides. But it is quite possible that certain conclusions are likely to emerge which would reflect our attitude towards this entire problem. It is needless to say that Gaṇgeśa's great contribution to the problem would be brought to the foreground wherever possible. To anticipate a general conclusion that is likely to emerge, it is very much plausible that the views of the rival schools are not really mutually incompatible as they at the first sight certainly appear to be. They may even be regarded in the long run as supplementing each other. The apparent incompatibility between these views then may partly be due to the fact that though it would seem they were giving different answers to the same questions, they were not always unanimous in their formulation of the problems, so that sometimes they were really answering very different questions.

I. PRELIMINARY DISTINCTIONS

Certain fairly well known distinctions may be mentioned at the very beginning.

1. *Two senses of 'prāmāṇya'* : The word '*prāmāṇya*' may mean either the property of being instrumental in bringing about true knowledge (*pramākaraṇatva*), or simply the truth of a knowledge (*pramātva*). In the former sense, *prāmāṇya* belongs to the various instrumental causes of true knowledge. In the latter sense, it characterizes a knowledge itself, if that knowledge is true. Of these two senses the second one is logically prior inasmuch as the very idea of being an instrumental cause of true knowledge cannot be understood without understanding what is meant by true knowledge and in effect without understanding what is meant by truth. The theories of *prāmāṇya*—the well known *svataḥ* and *parataḥ* theories—are concerned with *prāmāṇya* in the second sense, i.e. with the truth of a knowledge.[1]

2. *Two kinds of pramātva*: The Vedāntins who form a major group of participants in the controversy prefer to distinguish between two kinds of truth[2]: metaphysical truth (*tāttvika prāmāṇya*) and empirical truth (*vyāvahārika prāmāṇya*). A knowledge is metaphysically true if it can never be falsified at any time, past, present or future. *Metaphysical* truth then consists in *traikālika abādhitatva*. The truth which the Advaitins take to be *svataḥ* (in the sense or senses to be explained below) is not this metaphysical truth, but *empirical* truth[3], whose nature has yet to ɪᴅǫ made precise. It is this empirical truth which besides is, according to the Mimainsaka, the cause of unwavering activity (*niṣkampa pravṛtti*). This shows that although the Advaita metaphysics has the conception of an eternal truth, this does not lead the Advaitin to the utter scepticism of regarding all other knowledge falling short of the knowledge of Brahman as false. The *svataḥ* and the *parataḥ* theories are concerned with the *empirical truth* of—it is needless to add—the knowledge of finite human beings, and are not concerned with any other more perfect kind of knowledge, be it knowledge belonging to a God or be it the knowledge of Brahman.

3. *The theory of prāmāṇya and the theory of prakāśa*: The theory of *prāmāṇya* should be distinguished from a connected but quite different theory, namely, the theory of *prakāśa*. The latter is concerned with the apprehension not of truth but of the knowledge itself whose truth or falsity may at any time be under consideration. The *prāmāṇya* theory asks, how does a knowledge become true, and how is its truth ascertained? The theory

of *prakāśa*, on the other hand, asks the question, how is the knowledge itself known? How do I know that I know? One way of bringing home the fact that they are two distinct theories is to look into the various ways in which the different views about *prāmāṇya* have been combined with the different views about *prakāśa*. Bearing in mind that in each case we have a *svataḥ* theory and a *parataḥ* theory we may expect that there should be four different combinations. This expectation in fact stands confirmed. The four combinations are:

i.   the theory of *svataḥprakāśa* combined with the theory of *svataḥprāmāṇya* (upheld by Advaita and Prābhābara Mīmāṃsā);

ii. the theory of *parataḥprakāśa* combined with the theory of *svataḥprāmāṇya* (upheld by the Miśra and the Bhāṭṭa schools of Mīmāṃsā);

iii. the theory of *svataḥprakāśa* combined with the theory of *parataḥprāmāṇya* (upheld by the Bauddhas); and

iv. the theory of *parataḥprakāśa* combined with the theory of *parataḥprāmāṇya* (upheld by the Nyāya school).

The theory of *prakāśa* is in fact logically prior to the theory of *prāmāṇya*. The question about the apprehension of a knowledge is logically prior to, and independent of, the question about the origin and the apprehension of the truth of that knowledge. For unless the knowledge itself is known, no question can even be raised about its truth. The theory of *prakāśa* is also wider in scope inasmuch as it pertains to all states of consciousness and not merely to knowledge.

4. '*Svataḥ*' and '*parataḥ*' : The Vedānta and the Mīmāṃsā theory is known as the theory that truth is *svataḥ* whereas falsity is *parataḥ*. As opposed to this we have the Nyāya theory that both truth and falsity are *parataḥ*. The key terms in this controversy are '*svataḥ*' and '*parataḥ*', literally meaning 'from within' and 'from without' respectively. We would sometimes use the English words '*intrinsic*' and '*extrinsic*' more for reasons of convenience than for their accuracy in rendering the two Sanskrit terms.

When the Mīmāṃsā-Vedānta theory holds that truth is intrinsic to knowledge it means either or both of two things. It may mean on the one hand that the originating conditions of the truth of knowledge are precisely

the same as the originating conditions of the knowledge itself. On the other hand, the theory also holds that the knowledge and its truth are apprehended together. Thus, 'intrinsic' means both 'intrinsic with regard to origin' and 'intrinsic with regard to apprehension', both *utpattitaḥ* and *jñaptitaḥ*.

Similarly, when the Nyāya holds that truth is extrinsic to knowledge, it means both of two things. On the one hand it holds that the generating conditions of the truth of a knowledge are more than the generating conditions of the knowledge itself. It also holds that the apprehension of a knowledge *does not always* amount to the apprehension of its truth. Thus 'extrinsic' means both 'extrinsic with regard to origin' and 'extrinsic with regard to apprehension', *utpattitaḥ* and *jñaptitaḥ*.

With regard to origin, it should be borne in mind that the Nyāya does *not* hold that the truth of a knowledge is produced *after* the knowledge itself has come into being. The Nyāya rather holds (or, at least the majority of the Naiyāyikas do) that though a knowledge and its truth are produced together, their generating conditions are yet not quite the same, nor are they apprehended as a rule together.

Pārthasārathi Miśra in his *Nyāyaratnamālā*[4] mentions two meanings of the word '*svataḥ*' which may mean either 'what is related to oneself' or simply 'from oneself'. Raghunātha Śiromaṇi in his *Dīdhiti* on Gaṅgeśa's *Prāmāṇyavada* also distinguishes between two meanings of '*svataḥ*: 'from oneself' (*svasmāt*) and 'from what is one's own' (*svakīyāt*).[5] It seems to me that the distinction does not introduce anything new and so may be overlooked for our purpose.

It goes to Gaṅgeśa's credit to have shown that the words '*sva*' and '*para*' are relative terms, so that what is *sva* in one context may be regarded as *para* in another. Gaṅgeśa therefore (see para 35 of Gaṅgeśa's text) formulates his thesis independent of these terms though that means a more circuitous mode of speech.

II. DIFFERENT FORMS OF THE *svataḥprāmāṇya* THEORY

Although they all agree that truth of a knowledge originates precisely from those causal conditions which also give rise to the knowledge, the

different advocates of the *svataḥprāmāṇya* theory nevertheless differ amongst themselves as to the nature of the apprehension of truth. Even with regard to this latter question they all no doubt agree that a knowledge is as a rule apprehended together with its truth.[6] They differ, however, in the first place, with regard to the nature of knowledge and, secondly, as to the nature of our apprehension of a knowledge. Accordingly, we might distinguish between four different forms of the theory: the Prābhākara, the Vedānta, the Bhāṭṭa and the Miśra.

(a) The Prābhākara theory: The Prābhākara stands alone in thinking that there is no positive error. Strictly speaking, the problem of truth *and* error is simply meaningless on his theory, for there is no cognitive error. Is then the ordinary usage about truth *and* error without any significance? The Prābhākara would say that the only point about this distinction lies in the practical side of knowledge. When we say a knowledge is false we really mean—the Prābhākara seems to be saying—that it leads to unsuccessful behaviour?[7] On the cognitive side all knowledge is true. Even the so called false knowledge is, for every knowledge has its object which it manifests.[8] Bearing this in mind, we might say that the Prābhākara Mīmāṃsā distinguishes between three levels of truth and error:

In the broadest sense of the term 'truth', all awareness, and therefore all knowledge, is true. In a narrower sense of the term, all awareness other than memory is true. In a still narrower sense of the term, only those knowledges are true that lead to successful practice whereas those that lead to unsuccessful practice are false. Rāmānujācāryya uses three different terms for these three different kinds of truth: *yāthārthya, prāmāṇya* and *samyaktva*. *Yāthārthya* belongs to all awareness[9] (including memory and what ordinarily passes for erroneous apprehension), *prāmāṇya* to all awareness[10] excepting memory (but including even the so-called erroneous apprehension) and *samyaktva* only to such knowledge other than memory which leads to successful practice.[11] *Yāthārthya*, or truth in the widest sense, is coextensive with the property of being an awareness of…, or of being true to its object (*sarvasya jñānasyarthāvyabhicāritva*). The criterion of *prāmāṇya* is independence in manifesting the object; memory is not *pramā* since it does not independently manifest its object.[12] The test of *samyaktva* is the absence of contradicted practice.

Now, how does all this bear on the Prābhākara version of the *Svataḥprāmāṇya* theory? Ganganath Jha has raised a pertinent issue against the Bhāṭṭa theory of *prāmāṇya*[13] without himself realising that the objection is equally valid against the Prābhākara notion. For, if the test of *prāmāṇya* is independence in manifesting its object or, in other words, if *prāmāṇya* is the property of apprehending something not apprehended before (*anadhigatatva*), then *prāmāṇya* is not *svatogrāhya*. The apprehension of the *prāmāṇya* of a knowledge would in that case await the ascertainment of this further condition. Or, to put it differently, if *prāmāṇya* is the property of being other than memory, it could not be said to be apprehended along with the apprehension of the knowledge (whose *prāmāṇya* it is). It is clear therefore that neither *prāmāṇya* nor *samyaktva* are apprehended *ab initio*. If therefore the Prābhākara Mīmāṃsā advocates the theory of *svataḥprāmāṇya* that could only be with regard to *yāthārthya*;[14] for it is only in this broadest sense of 'truth' that every awareness is awareness of its own object and to apprehend a knowledge is *eo ipso* to apprehend it as knowledge of its own object.

(b) The Bhāṭṭa theory: The Bhāṭṭa school, agreeing though in the fundamental point of *svataḥprāmāṇya*, differs from the Prābhākaras in the following points.

The Bhāṭṭas regard knowledge as an imperceptible activity and not as something self-luminous. We come to know about our knowledge therefore —on the Bhāṭṭa theory—only through an inferential process which immediately follows upon the knowledge. The inferential process has the following character. The activity of knowing, itself imperceptible, is directed towards and terminates in the object which thereby comes to acquire a new property of 'being known'. This property called by the Bhāṭṭas '*jñātatā*' or '*knownness*' serves as the mark for our inference of the act of knowing which is its imperceptible cause. Unlike most other inferences, this inference of the knowledge from the *jñātatā* in the object does not wait upon my desire to infer: it automatically—unless hindered by more powerful factors—follows upon knowledge and in that sense no knowledge goes unknown, though again none is directly perceived.

Now, truth—according to the Bhāṭṭas—is apprehended *svataḥ* in the sense that the same inference from *jñātatā* which makes us aware of a knowledge also makes us aware of the truth of that knowledge. Truth of course has its origin in the very same factors which also give rise to the

knowledge whose truth it is but like the knowledge its truth also remains unknown at the beginning. The knowledge manifests its object without itself or its truth being apprehended till of course the above-mentioned inference brings both to light.[15],[15a]

But what does the Bhāṭṭa mean by 'prāmāṇya'' Kumārila has not given anywhere a precise definition of it. We could only fall back on the line: "tasmād bodhātmakatvena svataḥ prāptā pramānatā[16] which suggests the conjecture[17] that also for Kumārila, as for the Prābhākara, prāmāṇya is the same as awareness-of-the-object (=bodhātmakatva). In this sense of course every knowledge is intrinsically true. Other members of the school however are not as reticent as Kumārila, nor are they all unanimous on this point.

Umbeka, commenting on the Ślokavārtika, rejects the identification of prāmāṇya with bodhakatva on the plea that though the latter is intrinsic to all knowledge yet it does not serve to distinguish right from wrong knowledge,[18] for even the erroneous knowledge of a rope-snake has the property of bodhakatva inasmuch as it also manifests its own object. Umbeka concludes by defining 'prāmāṇya' as arthāvisaṃvāditvam, that is to say, as the 'property of being uncontradicted in its object'.[19] Mere manifestation of an object is not enough. A true knowledge must be uncontradicted in its object. Umbeka adds that it is this truth which is svataḥ in the sense of being produced by the cause of the knowledge itself.

Gāgā Bhaṭṭa goes further to define a true knowledge as a knowledge whose object was previously unknown and which is uncontradicted by another knowledge;[20] in this sense, prāmāṇya is the same as samyaktva of the Prābhākaras. But can truth in this sense as also in the sense of Umbeka be Svataḥ?

Pārthasārathi suggests a new distinction between two senses of 'truth': truth as pertaining to the knowledge, and truth as pertaining to the object. Apparently, his purpose is to circumvent the following difficulty. My knowledge of truth would take the form 'This knowledge is true'. Now on the Bhāṭṭa theory both the original knowledge and its truth are apprehended together. The original knowledge however being previously unknown, the judgment 'This knowledge is true' is not possible. Awareness of truth would therefore presuppose a prior apprehension of the knowledge—which would of course contradict the central thesis of the svataḥprāmāṇya theory. This difficulty is evaded by suggesting that the prāmāṇya is nothing other

than *viṣayatathātva* or the "suchness of the object", in which case the ascription of *prāmāṇya* to the knowledge cannot but be secondary[21],[22].

Now it seems to me that Pārthasārathi's distinction is hardly to the point. For, truth is an epistemological notion, and it is only as an epistemological notion that truth concerns us here. Truth in this sense, i.e. as the 'suchness of the object' or as the pure nature of the object hardly concerns the issue under consideration. The fact is that '*viṣaya*' itself is an epistemological concept, so that '*viṣayatathātva*' could only mean faithfulness or adequacy of the knowledge to its object.

We may then say that the Bhāṭṭas have suggested two notions of *prāmāṇya*, (*i*) of *prāmāṇya* as equal to *anadhigatatva*+ *abādhitatva* and (*ii*) of *prāmāṇya* as nothing other than *viṣayatathātva*. Of these two notions, it is (*i*) whose claim to be apprehended *ab initio* must be rejected, for the two constituent notions are sufficiently complex so as to require subsequent deliberation.[23] It is therefore (*ii*) which might put forward a reasonable claim for being *svataḥ*. But in that case the meaning of *viṣayatathātva* has to be made more precise. One thing seems to be clear: it is not the same as the *yāthārthya* of the Prābhākaras. For *yāthārthya*, as we have seen, belongs to all awareness as such, to right knowledge and error alike, while Pārthasārathi's notion is meant to distinguish right knowledge from error. If *viṣayatathātva* in this sense is to be *svataḥ*, then we have to take it that every knowledge quâ knowledge claims to be true to its object.

It must be added that though *viṣayatathātva* is meant to distinguish right knowledge from error, nevertheless—Pārthasārathi reminds us—when the Mīmāṃsaka seeks to establish the intrinsic truth of all knowledge, he has in view all knowledge and not merely the right ones.[24] This is in fact, as we shall have occasions to emphasize later on, one of the puzzling situations with which the *svataḥprāmāṇya* theory is faced.

(c) The Miśra theory: The third form of the theory is ascribed to the school of Mīmāṃsā associated with the name of Murāri Miśra none of whose writings is handed down to us but who is mentioned in Nyāya and Mīmāṃsā treatises.[25] This school is represented as combining the Nyāya doctrine of *anuvyavasāya* with the Mīmāṃsā theory of intrinsic truth. Again there is no difference as to the origin of truth, about which all the three Mīmāṃsā schools agree. The difference centres round the question of apprehension. The primary knowledge whose truth is under consideration is

apprehended in its *anuvyavasāya* or introspective awareness; this secondary knowledge also apprehends the truth of the primary knowledge.[26]

Hardly any arguments of the school survive. Gaṅgeśa however gives one argument in favour of the view. This is to the effect that since a knowledge is specified only by its object (*viṣayanirūpya*), the *anuvyavasāya* apprehending a primary knowledge should also apprehend that primary knowledge as being knowledge of such and such object, which in fact amounts to apprehending it as a true knowledge.[27] The underlying conception of truth seems to be, on the face of it, not very far from the Naiyāyika's. Truth is defined as *tadvadviśeśyakatve sati tatprakārakatvam*, and both these component properties—to be explained later on—are said to be knowable in introspection. Gaṅgeśa therefore takes great pains to show that truth is *more than the mere co-existence* of (1) the property of having a qualifier and (2) the property of having a qualificandum which possesses that qualifier. For this see

(d) The Vedāntic *theory*: The *Vedāntic* form of the *svataḥprāmāṇya* theory owes some of its peculiarities to the background of the Vedāntic metaphysics. For our present purpose, it would suffice to draw attention to two of its main features before raising the really critical issues that are at stake. In the first place, the Vedāntin's conception of knowledge is very different from the Mīmāṃsāka's. The word 'knowledge' means, in the Advaita works, either of four things: (*i*) a modification of the inner sense (*antaḥkaraṇavṛtti*) or (*ii*) consciousness as limited by a modification of the inner sense (*antaḥkaraṇavṛttyavacchinnacaitanyd*) or (*iii*) the witness self (*sākśī*) or, finally (*iv*) the pure undifferentiated consciousness free from all limiting adjuncts and determinations. Of these four, the question of truth or falsity does not concern either (*iii*) or (*iv*); not (*iv*), for it has no object and truth or falsity pertains to the relation of knowledge to its object[28]; not (*iii*), for the witness self to which, on the Vedāntic theory, everything is given either as known or as unknown is by itself neither true nor false.[29] It is really (*i*) and (*ii*) of which we could meaningfully predicate truth or falsity. Curiously enough, (*i*) is not self-revealing, for being a modification of the inner sense it is, on the Vedāntic principles, *jaḍa* or non-conscious. But there is the saving consideration that (*i*) never remains unknown, being in direct touch with the self-luminous witness self. Knowledge in the sense of (*i*) is therefore self-revealing only in a derivative sense. It is not revealed by itself, but it is revealed directly, i.e. without the mediation of another *vṛtti*,

by the *sākṣī*. It is (*ii*) which is knowledge in the strictest sense and which is self-luminous in a sense that is more direct than the sense in which (*i*) is so.

Secondly, *svataḥprāmāṇya* on the Vedāntic theory means that the truth of a knowledge is apprehended through the same *sākṣī*-awareness through which the knowledge itself is apprehended.

The really pertinent question however is, what does the Vedāntin mean by '*prāmāṇya*' in this context? In other words, in what precise sense of '*prāmāñya*' does the Vedāntin take it to be intrinsic to a knowledge?

The usual definitions of '*prāmāṇya*' are in terms of the uncontradicted character (*abādhitatvam*) and the originality (*anadhigatatvam*) of a knowledge.[30] We have however said before that the *anadhigatatvam* is a character whose ascertainment depends upon subsequent reflection and cannot be apprehended *ab initio*. It remains to be shown that the same could as well be said of *abādhitatvam*. This is practically admitted by Madhusūdana Sarasvatī. Uncontradictedness refers not merely to the absence of contradiction at the time of knowing[31] but also to the absence of contradiction in future. Now, Madhusūdana recognizes that though present uncontradictedness may be apprehended along with the knowledge, yet it is absurd to suppose that a knowledge is apprehended *ab initio* as incapable of contradiction in future.[32],[33]

Vivaraṇa regards *prāmāṇya* in the sense of the capacity of manifesting (its) object as being intrinsic to a knowledge.[34] But is not this capacity for manifesting (its object) common to both right knowledge and error, as Umbeka has rightly pointed out? For erroneous apprehension, like all apprehension, is of an object, and it also manifests its object. This sense of truth therefore does not serve to distinguish true from false knowledge. If it be said, that is just the reason why all knowledge is intrinsically true in this sense, we could only reply that truth in this sense could never possibly be absent in an apprehension so that the Vedāntin would not be entitled to hold the further position, which in fact he holds, that a knowledge may be rendered false through extrinsic circumstances. For, no matter what extrinsic circumstances might present themselves, no matter if a knowledge is proved to be erroneous, the apprehension still remains apprehension of something. When therefore the Mīmāṃsaka and the Vedāntin maintain that truth is intrinsic to a knowledge whereas falsity is extrinsic, they ought to understand the two notions of truth and falsity in such a manner that the one remains the contradictory of the other.

Should we then say that truth, for the Vedāntin, is nothing other than the *tadvati tatprakārakatva* of the Naiyāyika? According to this meaning of 'truth', a knowledge 'S is p' is true when p really belongs to S, that is to say, when S (p) is known as p. When p does not really belong to S, the knowledge 'S is p' is false. In Gaṅgeśa's opinion it is only in this sense that truth may be regarded as being apprehended *ab initios*[35] But the consensus of opinion of the Advaita writers seems to be that *tadvati tatprakārakatva* is common to both right knowledge and error and therefore does not constitute the sense of 'truth' in which all knowledge is intrinsically true (but not intrinsically false). Madhusūdana at least of all writers is emphatically clear on this point.[36] It is curious that though Gaṅgeśa considers *tadvati tatprakārakatva* as the feature which distinguishes right knowledge from error, Madhusūdana and many Advaita writers regard it as belonging to all apprehensions, not excluding error. There is reason therefore to suspect that the Naiyāyika and the Vedāntin do *not* mean quite the same by '*tadvati tatprakārakatva*'.[37] But for the present we shall leave the matter there with the hope that this question would receive further clarification in part III of this Introduction.

A way out is suggested by adding a qualification to *tadvati tatprakārakatva*. Not bare *tadvati tatprakārakatva* but that as qualified by the property of leading to successful activity is what serves to distinguish right knowledge from error.[38] This may indeed be so,[39] but can we take such a complex property as capable of being apprehended *ab initiol* On the other hand, it seems reasonable to suggest that at least the property of being the cause of successful activity *cannot* in any case be a feature which one apprehends *ab initio*, for like *abādhitatva, saṃvādipravṛttijanakatva* also refers to a future possibility which could at best only be anticipated now.

The exact sense of '*prāmāṇya*' in which the Advaitin could speak both of '*svataḥprāmānya* and of '*parataḥprāmāṇya*' has to be specified in some other manner. There are two other suggestions that we are to consider; the one gives a psychological account and saves the theory, the other suggests a definition and renders the theory valid *but analytically trivial*.

Gauḍabrahmānandī, after showing that *prāmāṇya* in the sense of *abādhitatva* cannot be regarded as *svataḥ*, suggests that '*prāmāṇya*' for that purpose should be regarded as being the same as 'the property of being a knowledge of anything which has not been known to be false'.[40] In this

sense, a knowledge is true insofar as—and in the sense that—it is not known to be false. This is a psychological sense of 'truth', for truth here consists in one's ignorance that a knowledge is false. Now, this has the merit that it accounts for the fact that truth is apprehended *ab initio without obliterating* the distinction between right knowledge and error. For, certainly we cannot call a knowledge 'knowledge' unless it is unaccompained by an awareness of its own falsity; in this respect, every knowledge, even an erroneous apprehension prior to the detection of its erroneous character, is accompanied by an awareness of its own truth. In connection with the definition of 'truth' as *arthaparicchedasāmarthya* it was pointed out that this feature is intrinsic to all awareness quâ awareness and not quâ true knowledge, so that it characterizes an erroneous apprehension even if the latter is recognized as erroneous. Now the present psychological definition of 'truth' has the advantage that in this sense truth belongs to an erroneous apprehension only so long as its erroneous character is not detected. Truth in this sense does not characterize all awareness but certainly belongs to all knowledge, and continues to characterize a knowledge so long as extrinsic circumstances do not divest that knowledge of its character of being a knowledge by exposing its pretensions and in effect by reducing it to a mere awareness. It is thus a good account of the meaning of 'truth' within the limits of the *svataḥprāmāṇya*-and-*parataḥprāmāṇya* theory.

Its defects however—if they are at all to be regarded as defects—are twofold. First, the sense given to 'truth' is chiefly psychological, and secondly, the definition is a negative one. Were the definition merely negative, we could pass it over; what is worse is that it smacks even of circularity. For, 'truth' is defined in terms of 'falsity', as if the idea of falsity is logically more fundamental or epistemically clearer. If however a knowledge is to be called 'false' when it is not true (or if an object is to be called false if it is not the object of a true knowledge), then the definition is plainly circular. Nevertheless as a psychological account of every knowledge-situation, it is based on a sound phenomenological basis.

The other definition is suggested by Madhusūdana in his *Advaitaratnarakśaṇam*. After rejecting some definitions of 'truth' as unsatisfactory on the ground that they apply to error as well, Madhusūdana proceeds to define 'truth' as 'theproperty of being a certain apprehension of an object which was previously unknown'.[41] Truth in this sense,

Madhusūdana claims, satisfies three needs: it serves to distinguish right knowledge from error, it is capable of being apprehended *svataḥ* as the theory demands, and further it can account for unwavering activity (*niṣkampa pravṛtti*) as the phenomena demand. It does not belong to error, for the content of erroneous apprehension, e.g. the snake in rope-snake illusion, exists only when it is being perceived and therefore has no unknown existence (*ajñātasattā*). Of the object of erroneous apprehension we cannot then say that it was unknown before: hence truth in the above sense does not belong to erroneous apprehension. It is capable of being apprehended *ab initio*, for—according to the Advaita epistemology—the prior unknown existence of what now comes to be known is an object of *sākṣī*-awareness. (What is now known through any of the means of true knowledge is at the same time known as having been unknown before.) Hence, the property of being a certain apprehension of what was previously unknown is something that is apprehended together with any knowledge and by the same *sākṣī*-consciousness.

One very curious feature of the Mīmāṃsā-Vedānta theory is that truth, on this theory, is apprehended *ab initio*, in all knowledge including erroneous apprehension prior to [the detection of its erroneous character. But as soon as what so long passed as knowledge is now known to be erroneous, it is divested of its pretensions to be knowledge. Thus truth should on the one hand be common to all apprehensions including error, and yet it should also serve to distinguish right knowledge from error. The theory seeks to satisfy these two apparently conflicting demands. With regard to Madhusūdana's definition of 'truth', we may say that prior to the detection of its erroneous character, even an error passes for true knowledge insofar as even the erroneous object is felt to have had a prior unknown existence; but as soon as the error is recognised as an error, its object is at once seen to possess only a *prātibhāsika* being, i.e. to say being only while it was being experienced. Being without unknown existence, it cannot be an object of a true knowledge.

Understood in this way, Madhusūdana's theory also gives us a psychological account of truth. For, a knowledge, on this theory, is true so long as it is taken to be opposed to *ajñāna* (i.e. to say *ajñānavirodhi*); negatively speaking, a knowledge is true so long as we are *not* aware of it as *ajñāna-avirodhi*, which is the same as saying that a true knowledge is the apprehension of something which has not been known to be false

(*mithyātvena ajñātam yat tadviṣayakajñāna*).[42] The latter is the definition of *Gaudabrahmanandi* and has been discussed above.

Madhusūdana, however, proceeds in a direction quite different from the above psychological interpretation of his theory. He goes on *to define 'jñānatva'* in terms of '*pramātva*', so that invalid apprehension is regarded as lacking even the generic character of *jñānatva*.[43] Error is really pseudo-knowledge, not knowledge proper.[44] To the well-known argument of the Naiyāyika that if truth originated from the same conditions as give rise to the knowledge, false apprehension should also become true, for the generating conditions of knowledge are also the generating conditions of false apprehension, the latter being, like true apprehension, a species of knowledge, Madhusūdana confidently replies that this need not be so, for false apprehension is not a species of knowledge.[45] Error is not knowledge. It follows *analytically* that truth is intrinsic to knowledge.[46]

We may now sum up the conclusions towards which the above discussions have been leading us.

There are two ways of defining '*prāmāṇya*', so as to render the *svataḥprāmāṇya*-and-*parataḥprāmāṇya* theory a plausible one.

On the one formulation, *prāmāṇya* is explained in the psychological language with reference to the knower's *unawareness* as to the falsity of the knowledge under consideration. On the other formulation, *prāmāṇya* is identified with the very generic character of *jñānatva*, so that a false apprehension is, by *definition*, not knowledge at all.[47] On both formulations, to know is to know truly, and to know a knowledge is to know it as true.

In the former sense, *prāmāṇya* belongs in common to all knowledge, right or erroneous, but in the long run, as the erroneous character of the error is detected, it deserts the erroneous apprehension. It would not be correct to ascribe to this theory the view that a knowledge is true if it is not false: that would be trivial. The theory rather says that knowledge is true (*not taken as true*) if it is *not known* to be false. Thus, on this account, truth is a derivative concept and fits in with the Advaita metaphysics that nothing empirical is real. Empirical truth, therefore, is a concept which is logically definable only in terms of falsity. It must be said that to avoid the above mentioned charge of circularity, the Advaitin must give a positive account of falsity (which indeed he claims to have given!).

The second formulation, at the first glance, makes the *svataḥprāmāṇya* theory an analytic consequence of the suggested *definition* of 'knowledge' in terms of '*pramātva*'. But the definition is more than an arbitrary linguistic recommendation: there is an important sense in which it is also phenomenologically descriptive. For, there is a certain absurdity in saying both 'I know that S is p' and 'S is p is false'. One cannot know and yet be in error with regard to what he knows. If something is known, it follows necessarily that it is true. Thus, according to Ayer,[48] in order that I may be able to say 'I know that S is p', three and only three conditions need to be fulfilled. These are: (*i*) that 'S is p' is true, (*ii*) that I am sure of (*i*); and (*iii*) that I who know have the right[48a] to be sure. Knowledge, according to Ayer, is intrinsically true in the sense that if something is known, it follows necessarily that it is true.[49] This follows, we are told, from the 'linguistic *fact*' that what is not true cannot properly be *said to be* known.[50] What happens if subsequently I detect that I was really in error? It would follow that I really did not *know*, that I had mistaken a pseudo-knowledge (*jñānābhāsa*) for a knowledge. Hence, it is not a knowledge which becomes falsified, but it is really a pseudo-knowledge whose pretensions to be knowledge are now exposed. Hence the curiously paradoxical situation that although the *svataḥprāmāṇya* theory defined 'knowledge' in terms of 'truth' thereby condemning error as pseudo-knowledge, yet in its attempt to establish its position it includes under its '*pakṣa* all that *claims* to be knowledge including knowledge in the true sense and pseudo-knowledge.

It should be added that if the *svataḥprāmāṇya* theory is stated in this way, then truth can be taken to be *svataḥ* only with regard to its apprehension (*jñaptitaḥ*) and not with regard to its origination (*utpattitaḥ*). It is only the Prābhākara who is constrained to accept that truth is *svataḥ* even with regard to its origin, for if he did not subscribe to this he would be contradicting his own cardinal doctrine that all knowledge is true, that there is strictly speaking no error at all. Others like the Bhāṭṭas and the Vedāntins may or may not[51] subscribe to this part of the *svataḥ* theory; they may remain content with a moderate form by regarding truth to be *svataḥ* only with regard to apprehension.

All others (except the Prābhākaras) believe that there is erroneous apprehension. While believing in this, they may choose to subscribe to either of the following two explanations: (*a*) they may hold that all

apprehensions are initially true but some of them become subsequently, owing to extraneous circumstances, erroneous; or (*b*) they might hold that all knowledge is initially *apprehended* as true, though some of these are, right from the beginning, erroneous and therefore not knowledge at all but are pseudo-knowledge whose falsity comes to be recognised later on owing to extraneous circumstances.

The alternative (*a*) is most consistently held by those for whom an objective definition of 'truth' is not possible and who would consequently define 'truth' in psychological terms as indicated above. But since in this sense truth is not an objective property so that calling a knowledge true is nothing other than not knowing it as false, it is apparent that to claim truth to be *svataḥ* with regard to its origination is rather trivial. This is so for the reason that on this theory *being true* and being *apprehended* as true are the same.

The alternative (*b*) is most consistently held by those who also believe in two other propositions: (*i*) that truth originates *svataḥ* in all knowledge, but not in erroneous apprehensions; and (*ii*) that nevertheless both knowledge and pseudo-knowledge are *ab initio* apprehended as true.

Both the Prābhākaras and those amongst the others who subscribe to (*b*) believe truth to be intrinsic to all knowledge. But this apparent agreement is reached by radically different approaches—in the case of the Prābhākaras by rejecting error and consequently by regarding all certain apprehension as amounting to knowledge, and in the case of the upholders of (*b*) by admitting error but at the same time by excluding error from the purview of the term 'knowledge'.

The Prābhākaras *extend* the scope of 'knowledge' to include all apprehension; the others subscribing to *(b) contract* its scope so as to include only right apprehension. It goes without saying that (*b*) is on a safer ground. For, the Prābhākaras by including under the scope of 'knowledge' all apprehensions— not excluding the *so-called* erroneous ones—can save their theory only at the cost of introducing an equally extended sense of 'truth' according to which all knowledge is true since all knowledge is an *"awareness* of…." It hardly needs be emphasised that in this last mentioned sense of 'truth', the *svataḥ* theory, though irrefutable, becomes trivial.

The Naiyāyikas also do not accept the distinction between knowledge and pseudo-knowledge in the manner of (*b*, nor do they accept either the psychological definition of 'truth' advocated in (*a*) or the trivial account of

the Prābhākaras. For the Naiyāyika, true and false knowledge form two *species* of knowledge, agreeing in the generic character of being knowledge but differing in the specific characters of truth and falsity. It follows that for him, truth *cannot* be intrinsic to knowledge as such, though it is left to be seen why he also does not regard truth as *svataḥ* even with regard to apprehension. This shall require a precise delimitation of the Nyāya concepts of knowledge and truth, ta which the next part of this introduction is to be devoted. It is only after we are able to fix the precise sense of 'truth' in which the Nyāya regards truth to be extrinsic that any attempt ta assess the traditional arguments and counter-arguments on both sides could bear fruitful results.

I should conclude this examination of the *svataḥprāmāṇya* theory by noting down a caution against a misinterpretation of this theory which has been most common but which strangely enough has not been challenged. It has been usual to regard this theory as but an Indian version of what passes in Western philosophy as the self-evidence theory of truth. Self-evidence, on the Western theory, is still *a criterion* of truth, a criterion which serves to distinguish truth from error. A *criterion of truth* is always double-edged; it is also a criterion of error. It is precisely the contention of the *svataḥprāmāṇya* theory however that *there is no criterion of truth, though there are criteria of error*. Knowledge as such is true or is apprehended as true; the criteria, when applied, cannot any more *prove* its truth. They may however establish the erroneous character of what so long had passed for knowledge. Error is proved to be error, but knowledge cannot be proved to be true. For the self-evidence theory, on the other hand, truth is proved to be true (or falsehood proved to be false) by the criterion of clearness and distinctness (or, by its opposite). This is far too simple to be a faithful account of the complex phenomena of the progress of human knowledge.

III. THE NYĀYA THEORY OF *Paratah-prāmāḥya*

In the preceding part of this essay, we have analysed the various notions of *prāmāṇya* upheld by the different advocates of the theory of *svataḥprāmāṇya*. Now we may take up the theory of *paratahprāmāṇya*, especially as upheld by its principal advocates, the Nyāya school of philosophy. It is only after the fundamental concepts and presuppositions—

ontological, logical and epistemic—are thus laid bare that we could fruitfully attempt a critical appraisal of the entire *svataḥ-parataᷤ* controversy.

The following exposition of the Nyāya theory of *paratahr prāmāṇya* has four parts. We start with an account of the Nyāya conception of *jñāna*, for when dealing with *prāmāṇya*, we are in fact concerned with something which is a property of *jñāna*. Next, we shall pass over to the conception of *prāmāṇya* in the Nyāya system. With the notions *of jñāna* and *prāmāṇya* clarified, we would be in a position to offer an account of the Nyāya theory of *paratahprāmāṇya*. In the last two parts, we shall enquire into the basic presuppositions of this theory.

(a) The Nyāya Conception of Knowledge (*Jñāna*)

(*i*) With regard to the Nyāya conception of *jñāna*, it is necessary for us to bear in mind firstly that *jñāna*, in the Nyāya ontology, has the status of a *guṇa* (which can be rendered into 'quality' only at the risk of grave misunderstanding). Every *guṇa*, in accordance with the definition of '*guṇa*' in the Nyāya ontology, rests in a substance and the substance, in the present case, is none other than the self. Since we are not, in the present context, concerned with the notion of self which therefore need not detain us, we may turn for a moment back to the notion of *guṇa* which, as has already been remarked in parenthesis, does not mean 'quality'. One only needs to remember that the Nyāya includes in its list of *guṇas* such things as *saṃyoga* (or conjunction) which is ordinarily regarded as a relation. Uddyotākāra regards "desire, etc." (*icchādayaḥ*) as *guṇas* on the ground that they cannot be subsumed under the rest of the categories (*pāriśesyāt*).[52] *Jñāna* is not an activity, but a product;[53] to call it an activity would, firstly, amount to an unusual extension of the ordinary notion of act, involving the notion of movement (*spandana*); but, secondly, it is not admitted by the definitions underlying the Nyāya ontology.[54] Further, *jñāna* is not a modification of any substance, and therefore it would not be correct to call it a state of a substance, if by 'state' be meant such a modification. For, *jñāna* is a *guṇa* of the self which is not capable of modification in the same sense in which a lump of clay is modified into a pot or in any other literal sense. And, of course, *jñāna* is far from being a mental state, for the mind is

only one of the factors in its production but certainly is not that in which what is thereby produced inheres. It must be noted that though the Nyāya gains an advantage by not regarding *jñāna* as a mental state, the incurable privacy of *jñāna* nevertheless persists, for each person's self and therefore his *jñāna* is directly perceivable only by himself and by none else. Thus, *a. jñāna* is a product arising out of a collocation of causal conditions. And like all products, it is an occurrent, i.e. to say, arises in time and is replaced by others; the fact that it is not a modification and the fact that it is without any component parts (*niravayava*) are two aspects of the same situation, and being without parts it is also without any ontological form of its own (*nirakdra*).[55] In this respect the Nyāya view stands in sharp opposition to the conception of *jñāna* in Sāmkhya or Vedānta, according to which it is a modification of a substance called *buddhi* or *antaḥkarana* and *buddhi* or *antaḥkaraṇa* being a composite substance assumes the shape and the form of the object. Not so in the Nyāya: the *jñāna* being a *guṇa* and therefore without parts does not assume any form or shape (*ākāra*). Similarly not being a *kriyā* it does not bring about any change in the object that is known, as the Bhāttas wrongly regard it as doing.

(*ii*) While thus ontologically, *jñāna* is a *guṇa* of the self, a product of various causal conditions, and yet itself without component parts and so without shape and form, epistemologic-ally it refers beyond itself to its object. This last feature is what serves to *distinguish jñāna* from the other *guṇas* of the self, i.e. from desire, aversion, effort, pleasure, pain, etc. *Jñāna* alone, of all the other *guṇas* of the self, has this self-transcending reference to an object, and this reference—or intentionality, as Brentano would call it —-is intrinsic to *jñāna* qua *jñāna*.[56] Others, a desire, an aversion for example, may refer to an object but only indirectly, i.e. through the *via media* of a *jñāna*.[57]

But, is not such self-transcending reference or intentionality intrinsic to consciousness as such? And, if so, are not pleasure and pain, desire and aversion states of consciousness, and therefore also intentional? The Nyāya answer is very definite on this point:'consciousness' and '*jñāna*' are, for the Nyāya, synonymous expressions.[58] To be conscious is to be conscious of something which again is the same as having a *jñāna* of that something. Pleasure and pain, desire and aversion then are not as such states of

consciousness, though we are—or, more accurately, become—conscious of them.[59]

What has been said above indicates the very wide sense in which the Nyāya, along with most other systems of Indian thought, uses the word '*jñāna*' so that to render this Sanskrit word '*jñāna*' into the English 'knowledge' would be—and, in fact, has proved—definitely misleading. In fact, it is really the other word '*pramā*'—which denotes ordinarily only a species of *jñāna*—that permits itself to be translated 'knowledge.' It is redundant therefore to say—as has, more often than not, been held—that '*pramā*' means true knowledge. '*pramā*' certainly means true *jñāna* but since '*jñāna*' is not synonymous with 'knowledge' and since, in accordance with the English usage, toknow that S is p entails that S is p, '*pramā* could safely be treated as being equivalent to 'knowledge'. That '*jñāna*' and 'knowledge' are not synonymous expressions is further indicated by the fact that the Nyāya would treat doubt as a species of *jñāna* while to doubt is not to know, according to the English usage of 'know', though doubting certainly involves some knowledge which is not itself doubting. It cannot be said that doubt is a complex form of knowledge involving two mutually contradictory predications and as such resolves itself into elements of which each taken by itself is a knowledge; and that if this be so, then the equivalence between '*jñāna*' and 'knowledge' may be restored. Now this indeed is a possible alternative and has been adopted by Mimamsakas in their zeal to establish *svataĥprd-māṇya*. It is also possible that some Naiyāyikas attempted such an explanation of doubt,[60] though the general tradition of the Nyāya regards doubt as an irreducible form of *jñāna*. Moreover, as would be emphasised later on, this latter explanation of doubt fits in better with the Nyāya conception of truth. Thus we may safely conclude that if I am conscious of anything in whatsoever mode it may be, in the Nyāya terminology I may be said to have a. *jñāna* of it, although in accordance with the ordinary use of 'know' in the English language I may not be said to know it.

After having warned in the just preceding paragraph that '*jñāna*' and 'knowledge' are not equivalent expressions, I would add that in the following discussion I *propose* to use the English word 'know' (and its substantive form) in exactly the same sense in which '*jñāna*' is used in the Nyāya, so that when I have a doubt, I would *say* I have a knowledge. Consistently with this *proposal, 'pramā*' would naturally be rendered 'true

knowledge' although—as has been pointed out earlier—such a rendering would be redundant if we keep to the ordinary use of 'know'. Now that the exact sense of '*jñāna*' has been sufficiently emphasised, our proposal to use 'know' and 'knowledge' in its place could not possibly mislead us in our philosophical conclusions.

(*iii*) So far we have explained the ontological and the epistemic nature of knowledge, as upheld by the Nyāya school. Now we shall consider it from the logical point of view. We are of course concerned only with the so-called *savikalpa* knowledge, for that alone, being propositional, admits of logical analysis. But before we go deeper into this matter, an initial difficulty must be mentioned. How at all is it possible to attempt a logical analysis of something that is a transitory occurrent, as a knowledge is according to the Nyāya ontology? Being a *guṇa*, a knowledge cannot be shared in common by two selves;[61] it is incurably particular and in a sense private too. Is a logical analysis of anything of such a nature possible? I am not quite sure what the Nyāya answer to this difficulty would be, but I am sure that whatever would be the answer would also illuminate one of the basic features of the Nyāya attitude towards knowledge. But I presume, the difficulty might be resolved by the Nyāya by denying that the ontological and the logical attitudes are opposed to each other. It is well-known that the Nyāya logic is ontological and, where necessary, psychological too. Logical structure is ilot something raised above the existent world or belonging to an ideal world of forms—but is itself a product of existent factors and is exhibited in existents and occurrents. If this be so, the Nyāya might contend, the objection is pointless, for a knowledge, though a transitory occurrent, may yet exhibit logical structures: such perhaps is the very nature of knowledge qua knowledge.

This leads us to the real crux of the situation. We have said above that *savikalpa* knowledge is propositional. In what sense is this so? Let me introduce the following distinctions, well known in Western logic, in order to find out exactly the Nyāya position in this respect:—

(*α*) An indicative sentence, if significant, is said to express a proposition. Two different sentences may express the same proposition. Thus a sentence may be distinguished from the proposition it expresses. A sentence is a physical occurrent; the proposition expressed is the meaning of the sentence; it is a logical structure.

(*β*) A proposition may be distinguished from a judgment by saying that in a judgment there is a mental act directed towards a proposition; the proposition is either asserted or denied, believed or disbelieved. A sentence is uttered or written, but a proposition is asserted, denied, etc. Now, the distinction between a mental act and the proposition towards which the act is directed owes its plausibility to the following situation: it is possible to retain an identically fixed proposition and to vary the mental acts directed towards it, so that the very same proposition I was at first doubting, I now assert but later on come to deny. A mental act is a particular occurrent, and private too; but a proposition is not an occurrent but, to use that highly provoking expression, a subsistent entity. Not only can I entertain different mental attitudes towards the same proposition, but two different persons may believe in the same proposition as well! Thus a proposition is objective, at least in the minimum sense of being inter-subjective.

Let us now ask: to which of these categories does knowledge, as conceived in the Nyāya, really belong? It is certainly not the sentence, for the sentence, whether spoken or written, uttered aloud or nascent, is not a *guṇa* of the self. Is it then the proposition expressed by the sentence? Again, we have to say, 'no'. For, the Nyāya does not distinguish between the meaning and the reference of an expression, and what an expression means is taken to be the same as that which it refers to, so that the meaning of a sentence is the state of affairs it refers to and not an intermediate, subsistent entity called a proposition. Further, those who believe in propositions distinguish them not only from sentences but also, as we have seen in (*β*) above, from the mental acts like asserting, denying, doubting, etc. It seems to me that the Nyāya would not also entertain this latter distinction, for it is not entitled to postulate mental acts—not certainly acts of the self—to serve as the designata of such introspective judgments as 'I know', 'I believe', 'I doubt', etc. Again, the Nyāya would not agree with the contention that it is the same content which I at first doubted and which I now assert or which I may later deny. The content of doubt for example is not 'S is p' which I come to assert later on, but involves the two mutually contradictory predicates 'p' and 'not-p'. It seems then that neither the distinction (α) nor those under (*β*) are acceptable to the Nyāya.

Positively, we may say that, according to the Nyāya, a *savi-kalpa* knowledge is propositional though not a proposition,[62] and further that the two expressions 'I know that S is p' and 'my knowledge that S is p' refer to

the same state of affairs. The two points require some elucidation. By saying that a *savikalpa* knowledge is propositional though not a proposition, I wish to do justice to both the fact that a knowledge is not a sentence but is expressed by it and the fact that it is nevertheless not a self-subsistent objective entity of the sort conveyed by the word 'proposition'. I call it 'propositional' for it is a logical complex analysable into constituent elements and relations. By the second of the above two statements, I wish to draw attention to the fact that it is the same fact, an event or a situation—a *jñāna*— which is the referent of the episodic verb 'I know' as well as of the substantive 'my knowledge', so that the distinction between a mental act of knowing and a content towards which the act is directed would prove to be an illusion fostered by language. Likewise, the expression 'I doubt' and the expression 'my doubt' refer to the same thing and not that the former refers to the act of doubting while the latter to the content. In fact, what is produced (in the self) is an act and a content in one, a *guṇa* having the specific property of intentionality. More accurately speaking, what is produced is a content having an intentional character and it is this intentional character whose linguistic formulation generates the illusion of its being an activity, which it really is not.

(*iv*) After having ascertained the ontological, the epistemic and the logical status of knowledge, we have now to turn to *the analysis of knowledge* in this system. It has been said before that knowledge, according to the Nyāya, is without any parts and is in this sense without any form (for, form, in this sense of the term, is constituted by the peculiar arrangement of the parts). Though knowledge is in this sense formless, yet it is—as has also been pointed out—capable of being analysed insofar as it has constituent logical elements and relations. There is no contradiction in holding these two views together, for the sense in which form is denied to knowledge is not the same as the sense in which form is again ascribed to it. Knowledge then is capable of analysis.

Analysing a knowledge requires a reflective attitude towards it. To know is to know an object, but not to know one's knowledge of the object at the same time. Knowledge, in other words, is directed towards the object and not towards itself. All this is familiar enough. Only it is important to bear in mind that the Nyāya like most schools of Indian thought advocates a direct realism; this is not however equivalent to saying that for the Nyāya there is no content of knowledge.[63] There is content of knowledge, though this

content is brought to awareness in the reflective awareness. In the primary awareness, the contents are *not* the media through which the object is presented or, better, represented; they are rather transparent so that we perceive the object itself through them. In the reflective awareness, it is these contents that are directly perceived while the object is presented as ancillary (*pucchalagna*) to them! Analysing a knowledge involves this reflective awareness plus[64] an analysis of the content of knowledge into its constituent elements and relations. These contents may all be brought under one category, technically called *viṣayatā*. Though the Nyāya speaks, e.g., of "*viṣayatā* that is attached to the pot" (*ghaṭaniṣṭhaviṣayatā*), yet considering the fact that for the Nyāya knowledge does not generate any feature in the object we may presume that the words 'attached to' have to be taken as a sort of transferred epithet, so that strictly speaking the *viṣayatā* attaches to the knowledge, or rather constitutes it. To say that a knowledge is *of* a pot is the same as saying that a knowledge-content intentionally refers to a pot which is again the same as saying that the content as so referring is the *viṣayatā* "that attaches to the pot".

Understanding '*viṣayatā*' in this wide sense as the regional title for all the various types of knowledge-contents, we have to add that '*viṣayatā*' again is subdivided into three sub-categories, technically called '*viśeṣyatā*', '*prakāratā*' and '*saṃsargatā*'. '*Viśeṣyatā*' is the general title for contents referring to the qualificandum, '*prakāratā*' for contents that refer to adjectives, while '*saṃsargatā*' for those that refer to relations (in each case, the contents are to be taken as so referring). The ideas of qualificandum and qualifier have to be here dissociated from the naive ontological ideas of substances that are incurably substantive and attributes that are incurably qualifying. We are on the other hand to recognise the possibility of a so-called substance, say a pot, characterising another substantive, say, the floor, so that in 'the floor with a pot', the pot also functions as an adjective. Much speculation has been done regarding the ontological status of these entities called '*viṣayatā*'. Some have regarded them as independent *padārthas*, others as "tertiary qualities".[65] No doubt they are called *jñānīya*, and no doubt again that they can be regarded both as "knowledgewise" and as "object-wise". But strictly speaking they are not properties of knowledge, but the knowledge-contents themselves: they constitute the knowledge, and are not its properties, for knowledge is not anything over and above these properties.

Against this last contention it might be objected that a *nirvikalpa* knowledge is knowledge though it is without any such *viṣayatā*, for certainly the *nirvikalpa*, according to the Nyāya, does not contain any qualifier. In reply, we may point out that the real situation is this: the *nirvikalpa* is not any more direct grasp of the object than *savikalpa* is. Both grasp their objects directly as well as bodily, and in both there are contents that are not apprehended in primary awareness. Though however the contents of *savikalpa* become objects of reflective awareness, the contents of *nirvikalpa* do not,—a fact, for the explanation of which the metaphysician could only postulate some obscure *pratibandhya-pratibandhaka* relation.[66] The *nirvikalpa* has also its *viṣayatā*—only it is by definition devoid of any qualifier and if there is no qualifier there is also no sense in saying that there is a qualificandum. Hence though without any *viśeṣyatā* and any *prakāratā*, yet the *nirvikalpa* has its *viṣayatā* for otherwise it would not be a knowledge of…[67]

Now it is one of the cardinal tenets of the Nyāya epistemology that no knowledge that finds linguistic expression can go without a qualifier (*prakāra*). The qualifier may either be explicitly mentioned or remain implicit. Take the example: 'the floor (that is) with the pot' (*ghaṭavad bhūtalam*). Here of course, one of the qualifiers is the 'pot' (*ghaṭa*) which is mentioned; but there is another that is not mentioned, i.e. 'potness' ('*ghaṭatva*')*. This is only an example of a general truth that every knowledge that finds mention has an unmentioned qualifier though the unmentioned qualifier—which is either a universal or a not further analysable property—is apprehended, insofar as it remains unmentioned, in itself. Mention it, and it, on its part, refers back to an unmentioned qualifier. The point under consideration may serve as a useful reminder that for the Nyāya analysis of knowledge goes beyond the mere analysis of the linguistic expression and that we have to instal ourselves in the attitude of reflective introspection and recall the exact *anubhava* i.e. the phenomenological datum.[68]

Consider again the knowledge expressed in 'the floor with a pot' (*ghaṭavad bhūtalam*). We have said above that there the 'pot' is a qualifier (*prakāra*) and the 'floor' is a qualificandum (*viśeṣyā*). In other words, there is a *prakāratā* referring to the pot and a *viśeṣyatā* referring to the floor. The former is technically called 'the *prakāratā* attached to the pot' and the latter 'the *viśeṣyatā* attached to the floor'. Further analysis reveals however that

the matter is not as simple as that. The 'pot', though in one respect, i.e. in relation to the 'floor', is a qualifier, yet in another respect, i.e. in relation to 'pot-ness', is a qualificandum of which 'pot-ness' is the unmentioned qualifier. Similarly, the other element, the 'floor', reveals further complexity though with the difference that in both its aspects, it functions as a qualificandum: firstly, in relation to the unmentioned qualifier 'floor-ness' (*bhūtalatva*) and secondly, in relation to the mentioned qualifier 'pot'. Being without any qualifier aspect, the element of 'floor' functions in the knowledge under consideration as the primary qualificandum (*mukhya-viśeṣya*). Analysis of this knowledge reveals thus six components (leaving aside the relational ones):

  i.   a *prakāratā* attached to the potness,
  ii. a *viśeṣyatā* attached to the pot,
  iii. a *prakāratā* attached to the pot,
  iv. a *viśeṣyatā* attached to the floor,
  v.   another *viśeṣyatā* attached to the floor,
  vi. a *prakāratā* attached to the floorness.

These six components constitute a unity by virtue of two sorts of epistemic relations. One of these is called the '*nirūpakanirūpita*' relation and the other the '*avacchedaka-avacchinna*' relation, into the precise nature of which we need not enter in the present context. It is important to bear in mind that even for the Nyāya with all its analytical attitude the unity of a knowledge is not entirely analysable into discrete components.[69]

There seems to be disagreement amongst the Naiyāyikas on one vital issue, namely whether variation in the form of expression necessarily points to a variation in knowledge. Some say it does; others say it does not. But we may take a safer position and contend that perception, of all knowledges, being entirely object-determined, every difference in expression does not mean a variation in knowledge so far as perception is concerned. The same perceptual knowledge, for example, may be formulated either as '*ghaṭaviśiṣṭabhūtala*' or as '*bhūtalavṛttitvaviśiṣṭaghaṭa*'. In case of all other kinds of knowledge there is far closer relation between the linguistic form and the knowledge-form, the inseparability being maximum in the case of *śābda* knowledge. In any case the ultimate test in these issues is one's subjective report and not the objective linguistic event.

(b) The Nyāya Conception of Prāmāṇya

Since we are concerned with *prāmāṇya* in the sense of *pramātva* and not in the sense of *pramākaraṇatva*, we may as before safely avoid discussion of the concept of *pramāṇa* in the Nyāya system. We must however begin with the concept of *pramā* or true knowledge. Knowledge is generally divided into *pramā* and *apramā*.[70] *Apramā* or false cognition (including both error and doubt) is also knowledge. No attempt is made in the system to reduce error and doubt to true knowledge, nor is there any attempt to exclude them from the purview of 'knowledge'. What then is common to true cognition and false cognition? Uddyotakara answers: "the ability to manifest the general" (*sāmānya-paricchedakatvam*).[71] Vācaspati explains it thus: even the erroneous cognition 'This is silver' manifests the yonder object with its general features like whiteness, shining character etc. While this much is common to both, *pramā* has certain characters that distinguish it from *apramā*, and these characters constitute *prāmāṇya. Prāmāṇya* therefore is taken by. the Nyāya in the sense of that which distinguishes true knowledge from false, and not in the weak sense of being instrumental to practical behaviour (*pravṛttyaupāyikam*), for—as Vācaspati points out— practical behaviour depends upon the mere presentation of the object and does not wait for a true apprehension of it.[72] Practical behaviour may indeed follow even upon doubt.

Further, *prāmāṇya* is a property of knowledge, and not of the object of knowledge. For if it were a property of the object, an erroneous apprehension apprehending its object would also be true and besides any knowledge while apprehending its object would apprehend its truth as well, which however is not the case.[73] Moreover no such property is experienced in the object.[74] *Prāmāṇya* then is a property of knowledge, though not a generic universal or *jāti* for reasons which we shall examine later on.[75]

There seems to be an unbroken line of speculation in the Nyāya school regarding the nature of *pramā*, though with slight variations in emphasis. Vātsyāyana defines it as "whatever is knowledge of the object" (*yadarthavijñānaṃ sā pramitiḥ*[76]), but removes the ambiguity later on by speaking of it as "the knowledge of that as that" (*tasmiṃstaditi pratyayaḥ*[77]). Uddyotakara defines *pramāṇa* as "the cause of knowledge" (*upalabdhihetu*[78]). Vācaspati tries to make the definition more precise by

adding that here what is meant by the word 'pramā' is the knowledge that does not deviate from its object and that is other than memory.[79] Udayana in his *Pariśuddhi* also emphasises the character of *avyabhicaritatva*,[80] though in his *Nyāyakusumāñjali* he gives a simpler definition of 'pramā' as 'right apprehension' and as 'independent'.[81] Jayanta takes it to be such knowledge of the object that both does not deviate from the object and is free from doubt.[82] Śrīdhara defines it as a definitive awareness that is uncontradicted.[83] Vallabha defines it as "the true knowledge" and further defines it as "the knowledge of something as not being what is other than it" (*parānātmatayānubhavaḥ*[84]).

Most of these definitions are negative in character, and the negations are intended to exclude error, doubt and memory. The Mīmāṃsaka's device of defining 'pramā' as a true knowledge whose object was not known before and thereby to exclude memory from being called 'pramā' is not acceptable to the Naiyāyikas who prefer the less cumbrous way of defining with the help of the notion of independence. Memory has not the ability to manifest its object independently, but always does so through the via media of a prior experience, Vācaspati accepts the validity of the well known objection that if *anadhigatatva* be admitted as a character of *pramā* then in case of a series of knowledges of the same object, the second, third, and all succeeding members of the series become *apramā*. Udayana raises fresh objections against taking memory as *pramā* in his *Pariśuddhi*. But it must be noted that the eagerness to exclude memory is rooted more in the traditional refusal to accept it as a *pramāṇa* than in any intrinsic defect of memory. Vācaspati almost admits this conventional basis when he says "*"pramāṇaśabdena tasyāpāstatvāt... na smṛtiḥ pramā, lokādhīnāvadhāraṇo hi śabdārthasambandhāḥ*". Udayana, commenting on this passage, seeks to show that memory is not true, i.e. that it is *ayathārtha*, on the ground that the remembered past is not now. But in the long run he is forced to confess that even if it is *yathārtha* it is not independent.[85]

To exclude doubt, Jayanta explicitly includes in his definition the phrase "free from doubt", while Śrīdhara has to speak of "definitive knowledge". Error is sought to be excluded by such adjectives as "undeviating" or by the more roundabout device of Vallabha.

What is called for is a positive definition which is yet capable of excluding error and doubt. It goes to Gaṅgeśa's credit to have taken up the

simple account of Vātsyāyana and made it far more precise. '*Prāmāṇya*' is now defined as *tadvati tatprakārakatva*, a concept which we shall presently analyse. But before we do that we may review in brief the reasons why Gaṅgeśa rejects some other definitions, new and old. Some of the older definitions which were positive in nature made use of the notion of *yāthārthy a*. Gaṅgeśa rejects it on the very important ground that there could possibly be no resemblance (which is what is meant by the word 'yathā') between knowledge and its object: *jñāne ghaṭatvādinā yathāśabdārthasādṛśyābhāvāt*. This is a clear rejection of any kind of 'picture' or 'copy' theory of truth. Knowledge could not be a picture or copy of its object. The two are entirely heterogeneous in nature. In his *Prakāśa* on *Pariśuddhi*, Vardhamāna considers various possible meanings of '*yāthārthya*' and rejects them all.

In his chapter on the definition of truth (*pramālakṣaṇa*), Gaṅgeśa considers a series of definitions. Truth cannot be defined in terms of novelty (as the Mīmāṃsakas tried to do), for this is not what we ordinarily mean by 'truth', and also because this definition would not apply to the case of a series of true knowledges of the same object. Truth cannot be defined as the property of being uncontradicted experience, for the contradicting knowledge (*bādha*) is itself a true, though contradictory, knowledge. Gaṅgeśa is pointing to the fact that merely from the fact that p is contradicted by q it does not follow that p is false or that q is true. He also rejects the definition of truth in terms of coherence (*saṃvāda*), for coherence means nothing other than "being mentioned similarly in another knowledge" (*jñānāntareṇa tathā ullikhyamānatvam*), and this may be found also in cases of error. What he means is that there can very well be a coherent system of false cognitions. It cannot also be defined in terms of successful practice, for such a definition would not apply to cases of true knowledges where due to some reason or other no practice follows, i.e. to cases of *upekṣāpramā* where the knowledge simply is passed over and does not provoke any practical reaction. Further, successful practice may at best constitute a test but not a definition of truth. Truth cannot also be defined as the property of being experience of the real (*tattvānubhavatvam*), for an unreal is never apprehended, not even in error. Truth cannot also be defined as the property of being an experience whose qualifier is a property which is not the counter-positive of an absence residing in the qualificandum (*viśeṣyaniṣṭhātyantābhāvāpratiyogidharmaprakārakānubhavatvam*), for it

does not apply to a true knowledge of conjunction, for the conjunction, being on the general Nyāya view *avyāpyavṛtti* or of incomplete occurrence,[86] may be absent in the qualificandum (and thereby may be the counterpositive of an absence residing in the qualificandum). Nor can it be defined as the property of being an experience whose qualifier is not a property which limits the counterpositiveness of a mutual absence residing in the qualificandum (*viśeṣyavṛttyanyonyābhāvapratiyogitāvacchedakadharmāprakārakānubhavatvam*), and that for precisely the same reasons as above. For if a tree is one having conjunction with a monkey, it is also one having no conjunction with the monkey (in another part of the tree); so that even a right knowledge 'This tree is one having conjunction with monkey' has a qualifier namely 'conjunction with monkey' whose absence is in the qualificandum. It follows then that there is in the tree also a mutual absence (or, difference) whose counterpositive is 'one having conjunction with monkey', and the Hmitor of the counterpositiveness is the property of being the said conjunction which is also the qualifier of the true knowledge that the tree has the conjunction. Truth cannot also be defined as the property of being an experience which does not have a qualifier non-resident in the qualificandum (*viśeṣyāvṛttyaprakārakānubhavatvam*). The definition would not apply to the true knowledge 'These are a pot and a cloth', for here the qualifier 'potness' is absent in the cloth, and the qualifier 'clothness' is absent in the pot. It is also not the property of being an experience having a qualifier which is in the same locus as *viṣayatā*, for this property also belongs to the error 'This is a snake' where the qualifier 'thisness' is in the same locus as *viṣayatā*.

We have only given a few of the definitions which Gaṅgeśa rejects. The resulting definition is stated in two stages. First comes a simpler form: If x is in y, then the experience of x in y is true knowledge (*Yatra yadasti tatra tasyānubhavaḥ pramā*). One has to add, as the commentators do, that if x is in y in the relation R, then the experience of x as being in y in the relation Ris true knowledge. A more formal definition follows: true knowledge is an experience whose qualifier is such that it belongs to the object (*tadvati tatprakārakatvam*).

Let us suppose, the knowledge is 'S is p'. This knowledge has amongst others two qualifiers, 'S-ness'and 'p-ness' Now, if the knowledge is to be true then the qualifiers must really belong to S which is the qualificandum.

The definition includes one variable i.e. the word '*tat*' which occurs twice, so that what we have is a dummy schemata with empty places which would give rise to a determinate entity only when the empty places have been filled in i.e. when the variable has been given a value.[87] There is a further rather curious feature of the definition. One part of it refers to an ontological situation, the other to an epistemological. The expression '*tatprakārakatva*' refers to an epistemological situation, namely to the fact that the knowledge under consideration has *that* (*tat*) as its qualifier. The expression '*tadvati*' refers to a correlative ontological situation, namely to the fact that that which is the qualifier of the knowledge under consideration (also) *really* belongs to the object of that knowledge. One thing should be obvious even from this preliminary explanation: the entity designated by '*tadvati tatprakārakatva*' is a curious "hybrid" entity, to use A. N. Whitehead's expression. Truth is neither a property of the object nor a mere property of the knowledge. It is rather relational in nature and as such has to be defined with reference to both the relata, the object and the knowledge, and this is what Gaṅgeśa does.

Let us now see how this definition applies to cases of true knowledge and does not apply to cases of false knowledge. Take the case of a true knowledge. I know a piece of silver as silver. The knowledge is expressed in the form 'This is silver'. This knowledge has three qualifiers: 'thisness', 'silver' and 'silverness'. Now let us take the qualifier 'silverness' as the value of the variable '*tat*'. The knowledge in that case is one which has 'silverness' as its qualifier, it is *rajatatvaprakāraka*. Now since, ex hypothesi, the 'this' designates a real silver we can say that the *this* possesses silverness (or, is *rajatatvavat*). The knowledge therefore possesses the property of *rajatatvavati rajatatvaprakārakatva*, which is the same as the truth of this knowledge 'This is silver'.

Consider on the other hand a case of error. I mistake a piece of shell for silver. I express my knowledge in the judgment 'This is silver'. This knowledge has also 'silverness' for its qualifier. As regards the qualifiers there is nothing to distinguish right knowledge from error. The distinction then has to be sought for elsewhere, i.e. in the fact that in error the 'silverness' which functions as qualifier does not belong to the qualificandum *this*. In other words, the *this* is not *rajatatvavat*. The definition then does not apply to a case of error.

Let us take a case of doubt. A doubt by definition is a knowledge with two mutually contradictory qualifiers. 'Is this a man or not?' is an example of doubt which has amongst others two mutually contradictory qualifiers 'manhood' and 'absence of manhood'. Both of these cannot belong to the thing designated by 'this'. It is then easy to show that the doubt is not *tadvati tatprakāraka*.

It should also be obvious by now that no knowledge is wholly false. Every error, even doubt, contains an element of truth. With the help of Gaṅgeśa's definition we are in a position to give sense to this fact. In the ordinary sense of the words 'whole' and 'part', a knowledge is not a whole with parts. But now we can say that with regard to some one of its qualifiers at least a knowledge must be true. In other words, it is possible in case of every knowledge to give a value to the variable *'tat'* such that the knowledge under consideration may be shown to possess *tadvati tatprakārakatva*. This is possible, for example, in the above illustrations by choosing 'thisness' which certainly belongs to the *this*.[88] In the case of doubt one could show even more than that; if one of the two mutually contradictory qualifiers does not belong to the qualificandum the other one does. Though a false knowledge is thus not false in all respects, a true cognition must be true in all respects, i.e. must have no qualifiers which do not belong to the qualificandum.

In order to bring out the full implications of Gaṅgeśa's concept of truth it is necessary to emphasise, even at the cost of repetition, that truth on this theory is a "hybrid" entity, having both epistemic and ontological components. With this we have to exclude any possibility of so interpreting *'tadvati tatprakārakatva'* as to reduce it to a purely epistemological property. It is possible, for example, to construe *'tadvati'* as meaning *'tadvadviśeṣyakatve sati'* meaning 'having a *viśeṣya* which possesses *tat*'. *'Viśeṣyatā'* being an epistemological notion, the entire notion becomes an epistemological one, and the force of Gaṅgeśa's definition is gone. It has been attempted, for example, by Madhusūdana Sarasvatī in his *Advaitaratnarakṣaṇam*, to show that in this sense *tadvati tatprakārakatva* is common to both truth and error. This is not surprising, for Gaṅgeśa's notion has been diluted thereby.

Two comments may be made in this connection. In the first place, even on this interpretation the ontological claim is not completely eliminated. *'Viśeṣyatā'* is an epistemological notion no doubt, but the idea of

'tadvattva' seems incurably ontological.[89] Secondly, the analysis of the definiens into *'tadvadviśeṣyakatve sati tatprakārakatva'* is not correct for still another reason. It does not fully express the unitary nature of the concept of truth. The definiens should then be more accurately analysed, or better, explicated. The explication may proceed through the following stages:

1. *Tadvadviṣayakatve sati tatprakārakatva* (= the property of having 'that' as its qualifier and an object which possesses the *that*)—This is virtually useless, for even error has an object possessing the *that*. It depends upon what is to be called the object of a knowledge. No doubt, 'object' is an epistemological notion. The Prābhākaras then have some justification in claiming that the object of the alleged false cognition 'This is silver' is the silver.

2. *Tadvadviśeṣyakatve sati tatprakārakatva* (= the property of having 'that' as its qualifier while the qualificandum possesses the *that*)—This seems to be the conception of truth of Murāri Miśra and is claimed by him to be something which can be apprehended by introspection, for *viśeṣyatā* like *prakāratā* is an epistemological entity. If *tatprakārakatva* can be apprehended by *anuvyavasāya*—as the Naiyāyikas also admit—then *tadvadviśeṣyakatva* may also be so apprehended. Further, consider this case of a false cognition 'These two (a cloth and a jar) are a jar and a cloth', wherein the cloth is taken to be a jar and vice versa. (It is more natural to make such a mistake in the case of a piece of shining shell and a piece of silver. Certainly more suitable cases may be thought out.) Here the qualificandum 'jar' possesses the qualifier 'jarness', and the qualificandum 'cloth' possesses 'clothness'. Nevertheless the cognition is an error, for the cloth has been known as jar and the jar as a cloth. The definition as explicated under 2, illegitimately extends to such cases of error.

3. *Tadvadviśeṣyakatvāvctcchinnatatprakārakatva* (= the property of having 'that' as its qualifier which is limited by the property of having a qualificandum which possesses the *that*)—This definition avoids the difficulty last mentioned under 2. In that example, 'clothness' as a qualifier is not limited by the fact of the cloth being the qualificandum, and so also in the case of the other qualifier. The qualifier must qualify with regard to the right qualificandum namely the qualificandum which possesses that property,[90] Further this explication succeeds in bringing out the unitary

nature of the notion of truth by making the two components *'tadvattva'* and *'tatprakārakatva'* limit or determine each other.

4. Further, the explication should also take into consideration the relation in which the property serving as the qualifier belongs to the qualificandum. The qualifier also must qualify in the same relation, or better, the qualifierness of that qualifier must be limited by that relation. This helps to exclude a knowledge 'The jar is in its parts in the relation of conjunction' from the purview of 'true knowledge', for according to the Nyāya ontology the jar is actually in its parts in the relation of inherence and not in the relation of conjunction. The resulting explication becomes *'tatsambandhāvacchinnatadvanniṣṭhaviśesyatānirūpitatat-sambandhāvacchinnatanniṣṭhaprakāratāśālijñānatva'* .

It is important not to lose sight, in the midst of this mystifying jargon and complexity, of the central fact that truth according to this definition is a unitary notion having heterogeneous components, not merely epistemological. The relevance, in fact the central place, of this fact for the Nyāya theory of *parataḥprāmāṇya* will be brought out in the next part of this introductory essay.

(c) The Nyāya Theory of Parataḥprāmāṇya

With the underlying notions of knowledge and truth thus explicated we may now attempt a formulation of the Nyāya theory of *parataḥprāmāṇya*. As in the case of the *svataḥ* theories, this theory has also two aspects, one concerns the origin of truth and the other its apprehension. In its first aspect the theory holds that the truth of a knowledge is not produced by the same conditions that give rise to the knowledge itself. It is rather produced by some extrinsic circumstances, some additional factors, known as *guṇas* or excellences. In its second aspect the theory holds that the truth of a knowledge is apprehended neither by that very knowledge, nor by the *first* apprehension of that knowledge—be that apprehension an introspection as with the Miśras or an inference as with the Bhāṭṭas—but only[91] by a subsequent inference which ensues either upon the confirmatory knowledge or upon the successful termination of the practical behaviour to which the knowledge under consideration leads us, or by the mark of *'tajjātīyatva'* to be explained below.

Amongst the host of arguments which the Nyāya advances in support of its contentions, two are most important. The first is in support of the extrinsic origination of *prāmāṇya*. First explicitly formulated by Udayana, it states that if *prāmāṇya* originated from the same conditions that give rise to the knowledge quâ knowledge, then even an invalid cognition would come to possess *prāmāṇya* since it too has the same originating conditions, and that is plainly absurd. The second argument is in support of the *parataḥ* apprehension of *prāmāṇya*. Also first formulated by Udayana, though made far more precise by Gaṅgeśa, it argues that if with the first apprehension of a knowledge we also know it as true, then it would be impossible to have any doubt regarding the truth of that knowledge soon afterwards. It is not our purpose to take sides and to decide if these arguments are tenable or not. It is rather our intention to bring out the exact nature of the controversy. We shall examine the nature of the arguments in the next sections. For the present, we are interested in making the Nyāya contention more precise, and for this purpose it is necessary to bear the two arguments, especially the second one, in mind.

The Nyāya is not contending that when a knowledge comes into being, it is at the beginning neither true nor false. Such a contention would have been plainly absurd. It rather contends that every knowledge is either true or false, right at the beginning. Only its truth or falsity—whichever may be the case—is due to a set of conditions that are different from those other conditions that give rise to the knowledge: in the case of truth, these conditions are called *'guṇas'* , in the case of falsity they are called *'doṣas'* . The legitimacy of this distinction would be questioned in a later context. For the present, let us confine ourselves to the second aspect of the theory and seek to make it as much precise as possible.

Since according to the second of the above mentioned arguments the truth of a knowledge is not apprehended *ab initio*, for if it were there would have been no room for subsequent doubt, it seems to follow that in those cases where no such doubt takes place truth is apprehended *ab initio*. These cases in fact put the Naiyāyika to great embarrassment. There are at least three such cases; inference, confirmatory knowledge or *phalajñāna* and knowledge with which one has acquired sufficient familiarity (*abhyāsadaśāpanna jñāna*).

As regards inference, Vācaspati clearly admits that it is known right from the beginning as valid, for amongst the originating conditions of inference

there is a certainty about the universal major premise. There is no room left therefore for having any subsequent doubt in the validity of the inference.[92] Udayana is not so confident and takes up a more halting attitude. He is willing to grant that inference arises by manifesting the suchness of the object.[93] Most reluctantly he concedes that truth is here apprehended *ab initio*. Yet he makes a desperate attempt to reconcile this with the *parataḥ* theory by suggesting that in such cases both may be true.[94] The Navya Naiyāyikas take up a more uncompromising position and deny that the truth of an inference is ever apprehended *ab initio*. For them there is always the possibility of doubt. Under such circumstances one has to review the entire Nyāya theory of inference in order to decide which of these attitudes is more consistent therewith. For the present however one or two features of the theory would help us in assessing the situation.

It is well known that the Nyāya does not draw any distinction between the psychological process of inferring and the logical process. The two in fact are taken to coincide. An inference quâ inference is a logically valid inference. There is strictly speaking no fallacious inference. The so-called *hetvābhāsas* are rather hindrances (*pratibandhakas*) to inference than errors of inference.[95] An inference then as a rule is a valid inference and does not permit any doubt about its validity. But at the same time one may very well be in error about the universal major, and though one makes an inference based upon a certain belief in such a major premise it is likely that on a subsequent occasion one comes to doubt the truth of the major premise and therefore also of the conclusion it had led to. Thus we find on the one hand that in the process of inference one cannot err and yet on the other hand one might possibly have started from a false universal major. That one cannot err in the process of inference is a curious doctrine held by the Naiyāyika and is due to his further belief that the psychological process never deviates from the logical. But it may quite well be that this belief is largely based on a linguistic decision not to call those processes of thought 'inference' which also do not conform to the logical standard. It seems therefore that if by 'inference' be meant the conclusion arrived at it is liable to be doubted as soon as one, for any reason, is led to doubt the truth of the universal major. If however by 'inference' be meant the process of inferring it is intrinsically valid on this theory. Vācaspati's contention contains this much of truth that unlike perception and *śabda* inference arises out of a sense of certainty, so that the least doubt in the truth of the universal major would be frustrating

and would not let the inference take place. An inference therefore arises with an apparently unshakable certainty.[96] If by *prāmāṇya* be meant this sense of certainty then certainly it is intrinsic to inference. But the real issue is, whether *prāmāṇya* in the sense of *tadvati tatprakārakatva* is so or not. At least Vācaspati has no sure ground for saying that it is so. I would think that for Nyāya it is not so and this supposition is likely to fit in better with the Nyāya theory of truth.

The eagerness on the part of some Naiyāyikas like Vācaspati to accord to inference an intrinsic truth is due to an embarrassment to which they are otherwise likely to be subjected from another source. The Naiyāyikas believe, as we have said before, that the truth of a knowledge is apprehended by a subsequent inference. Now it is asked by the Mīmāiṃsaka, how is the validity of that inference to be established? If by still another inference, how is this second inference to be validated? In order to avoid such an unpleasant infinite regress some would like to treat inference as intrinsically valid and as in no need of validation. But, as we have seen, the Naiyāyika need not go to that extent of holding that its *tadvati tatprakārakatva* is apprehended[97] right from the beginning. He might adopt a more halting attitude and say that inference is accompanied by a sense of certainty that comes to be questioned only if the universal major is for some reason or other doubted.

Let us now consider the confirmations or the *phalajñana*. Here again an embarrassment similar to the above awaits the Naiyāyika. For if the inference through which the truth of the first knowledge comes to be apprehended depends upon the confirmation or the *phalajñana* (e.g. quenching of the thirst in the case of a perception of water), it may quite well be asked, how are these confirmations themselves to be validated? In reply, Vācaspati points out that the *phalajñana* is never questioned by the discerning persons.[98] But why? The answer given is that its familiarity leads us to infer its undeviating character through the mark of *tajjātīyatva* (the property of belonging to that class).[99] Thus instead to taking them as intrinsically true and as self-validating[100], Vācaspati includes them in a much wider class of 'familiar' cases whose sheer familiarity rules out any need for further validating them. The entire idea of familiar cases, cases that have become *abhyāsadaśāpanna* and whose truth is immediately inferred—without waiting upon confirmation—through the mark of *tajjātīyatva* is

shrouded in obscurity and Udayana's attempts to throw light on this difficult notion hardly succeed in giving a completely satisfactory account.[101] It is obvious that *tajjātīyatva* can serve as a mark of truth only when the knowledge under consideration has become a familiar case. Further this knowledge is a fresh occurrent. To say that it is a familiar case could then only mean that it is a knowledge the like of which has been experienced before and has been known to be true. What apparently distinguishes these cases from new knowledges is that in such cases one takes them for granted and entertains no doubt about their truth whereas a new knowledge demands to be confirmed. But there are two different notions involved, the notion of 'familiarity' and that of 'belonging to the same class', notions that evade logical precision. What is the test of familiarity? How many times must one have similar experiences in order that they may become *abhyāsadaśāpanna*? It is not possible to lay down any general rule. One is unavoidably led to the conclusion that that knowledge is called 'abhyāsadaśāpann' in whose case no doubt arises soon afterwards, so that to say that the *abhyāsadaśāpanna* knowledge does not demand validation appears tautological. A further inference based on the mark of *tajjātiyatva* is not called for. One does not infer anything, only one does not in such cases as these doubt. Besides, what does the word 'tat' in 'tajjātīyatva' mean? Not certainly the class of true knowledges, for, as Udayana points out, that exactly is what is to be proved by the supposed inference. It does not mean the class of knowledges that give rise to successful practice, for the mark is supposed to operate, if the supposed inference is not to be pointless, prior to confirmation through successful practice. Nor is *tajjātiyatva* any further unanalysable property in such knowledge which we perceptually discern, for no such property is so discerned. Udayana's solution after rejecting these alternatives is as follows: Every knowledge is of some object and the determinations of the object also serve to mark out the knowledge. Thus a body is characterised by hands and feet, etc. Now if I have a knowledge of something having hands and feet, etc. and say 'It is a body', my knowledge is thereby included under a familiar class of knowledge: in this sense *tajjātiyatva* = *tattadupādhiviśiṣṭatattadanubhavatva*.[102] This is a good reflective account of why we take certain knowledges for granted, but it is not corroborated in our unreflective acceptance of a familiar case. Further, if this is the meaning of the mark in the supposed inference then this supposed inference hardly

differs from the inferences used to establish the truth even of the unfamiliar cases. Gaṅgeśa also makes use of the mark of *tajjātiyatva* in the series of examples of the latter sort of inference and gives the following example —"This knowledge of the body is true, for it is a knowledge of the body in what possesses hands and feet, etc."[103] This shows that either there is no inference at all in the case of a familiar knowledge or if there is any in the supposed manner the supposed sort of inference also takes place in the case of knowledges that have not yet become quite familiar!

Thus we find that in none of these knowledges truth is apprehended, on the Nyāya theory, right from the beginning. In every case therefore there is scope for and the necessity of further validation or correction. It has of course to be admitted that the need for validation is the most pressing in the case of 'non-inferential knowledges that are not confirmations and that are of the unfamiliar sort'.

There are yet two other cases where the Naiyāyika is often led to recognise intrinsic truth. These are the knowledge of the substantive (*dharmijñana*) and the *anuvyavasāya* of the primary knowledge. In both cases, again as before, one of the motives for recognising some sort of intrinsic truth is to avoid infinite regress. In the former case, there is besides a logical basis which has been examined before. Strictly speaking, this need not lead us to a revision of the *parataḥ* theory that in all knowledge truth is extrinsic, for the so-called *dharmijñana* is not a complete unit of knowledge by itself but is always a constituent of a complete knowledge. If however it be regarded as a possible complete knowledge expressible in the form 'this' or 'This is this', then its infallibility is merely an analytic consequence of its trivial character.

With regard to *anuvyavasāya* the matter is different and it is not at once clear why it should be regarded as infallible. Both Vācaspati and Udayana emphasise that it is never found to err and that hence there is no room for doubt. "No one who does not have a knowledge introspects 'I am knowing'; no one has the introspection 'I am knowing a silver' when in fact he has knowledge of a shell."[104] Vardhamāna adds, "No one has an introspection of a knowledge when in fact he has a state of feeling": All that this empirical argument proves is that we do not generally err in our introspection and that therefore we do not generally doubt its truth. There is besides little practical reason that could stimulate such a doubt. Vardhamāna rightly remarks, and is here closer to the spirit of the Nyāya, that by calling

all such knowledge *svataḥpramā* what is meant is that there is in such cases no initial apprehension of falsity,[105] and hence no initial doubt to start with.[106]

IV. CRITICAL EXAMINATION OF THE ARGUMENTS

(*a*) The *Utpatti* or origination of truth:—

One of the two questions that have been asked is, what is the cause of the truth of a true knowledge? Do the same causes which give rise to a knowledge also produce its truth, or are additional factors needed for the latter purpose? The *svataḥ* theory holds that the truth of a knowledge is produced by the very same conditions which cause that knowledge itself. The *parataḥ* theory holds the opposite view, namely that additional factors, called by the theory 'gunas' or 'excellences', are needed to make a knowledge true.

Now, the issue about the apprehension (*jñapti*) of truth is, it must be confessed, more intelligible to us than that about the origin (*utpatti*) of truth. In Western theories of truth two questions are discussed: one of them concerns the nature and the definition of truth (*pramālakṣaṇa*) and the other concerns the test of truth. The latter question is no doubt included in the problem of *jñapti*. But the peculiarly Indian question about the origin of truth, viz. about the originating causes of truth, is somewhat difficult to grasp unless one instals oneself in the peculiarly ontological-causal attitude which prevails in most Indian schools, especially the Nyāya-Vaiśeṣika. Even the epistemology is not free from causal considerations. Knowledge is an occurrent, and like all occurrents it arises out of certain colio cation of appropriate causal conditions. The same would hold good of true knowledge, which is a species of knowledge. It is sensible therefore to ask, out of what causal conditions does true knowledge arise? It should be borne in mind that the Nyāya conception of *pramāṇa* is both (*i*) the conception of the various kinds of true knowledge, and also (*ii*) the conception of the *causes* of such kinds of true knowledge.

It may be asked, can one speak of the causes of truth itself? True knowledge may have an origin and so may have causal antecedents. But truth being that which is common to all true knowledges and which at the same time marks them off from all false cognitions could not be said to have a causal origin. An individual human being is born; a particular instance of red is caused. But manhood and redness do not have causes, they are not simply things of which a causal enquiry can meaningfully be made. They are eternal universals. Does not the same hold good of truth? Of course, *guṇas* of finite substances are causes, but truth is not a *guṇa*, for knowledge, itself a *guṇa*, could not possess another *guṇa*. Truth rather looks like a universal and if it were really so it would be like all universals uncaused.

The Naiyāyikas therefore proceed to show that truth is not a universal. There are chiefly three arguments which are advan ced to prove that truth is not a true generic universal (*jāti*).[107]

1. Truth and immediacy of perception are involved in *sāṅkarya*, they are overlapping classes. Truth is present while immediate perceptuality is absent in any instance of valid inference. Imme diate perceptuality is present while truth is absent in any instance of erroneous perception. Both are again present in right perce ption. Thus the two characters, though they coexist in some cases, are not related as pervader and pervaded. They are not therefore true generic characters (*jātis*), for *sāṅkarya*, as is well known, is one of the *jātibādhakas*; two *jātis*, if they coexist, must be related to one another as pervader and pervaded.

2. Further, a *jāti* should be *vyāpyavṛtti* (or must have com plete occurrence, in the language of Ingalls). It cannot be that a thing is in one part an instance of one *jāti* and in another not. if a *jāti* inheres in an individual it must be in it as a whole, and not in parts. But in every instance of error there is an element of truth. Every knowledge, even a case of error, is true insofaras the substantive (*dharmin*) is concerned. Therefore both truth and the absence of truth inhere in the same individual, which is not permissible in the case of a true *jāti*.

3. If truth were a *jāti*, it would always be mentally perceived whenever the appropriate instance is. But that is not always the case, and moreover such a possibility would render any doubt about truth inexplicable. The assumption of truth as a *jāti* is incompatible with the *parataḥ* theory not only with regard to *utpatti* but also with regard to *jñapti*.

It would be by now obvious that these arguments rest on the two highly controversial notions of *sāṇkarya* and *vyāpyavṛttitva*, notions about which even the Naiyāyikas are not in perfect agreement amongst themselves. If *sāṇkarya* is not regarded as a *jātibādhaka* and if the notion of *vyāpyavṛttitva* is suitably defined so as to render truth *vyāpyavṛtti* with regard to that component where it does inhere, then there appears to be no overriding objection against taking truth to be a *jāti*, excepting that such an admission would render the *parataḥ* theory false, at least with regard to the *utpatti* of truth.

The Naiyāyikas may try to save the theory in either of two ways: They may contend that it is not truth with whose origin they are concerned, it is rather the instance of true knowledge. What has *utpatti* is not *pramātva* but *pramā*. This seems to con form to Gaṇgeśa's own formulation of the *utpatti*-thesis: "*Ut-padyate'pi pramā parato na tu svato...*". The thesis then is that the causes of a true knowledge are more than the causes of knowledge quâ knowledge: this more that is involved is called '*guṇa*'. The only difficulty about this way out is that it introduces an undesirable cleavage between the *utpatti* and the *jñapti* theses, the former being concerned with truth (*jñānaprāmāṇya*) and the latter with true knowledge (*pramā*). It is certainly desirable that both should pertain to the same thing. But this is not a difficulty that would ruin the theory.

The other way out of the difficulty pointed out earlier is to stick to the contention that truth itself originates. In that case the Naiyāyika would have to say that there is no truth in general, that truth in each case is a different entity, and not being a generic universal it itself originates. Truth in general, namely *tadvati tatprakārakatva* is not itself an entity. It is a dummy schemata containing variables. But *vahnitvavati vahnitvaprakārakatva* is an entity, and it originates with every true knowledge of fire as fire. The Naiyāyika has then to reinforce his arguments for pro ving that truth (general or specific) is not a *jāti*, and he should make his arguments independent of the controversial notions of *sāṇkarya* and *vyāpyavṛttitva*. But this, it would seem, has not been done satisfactorily enough. There is something deceptive about the thesis that truth, even in the specific sense, originates. A true knowledge considered as an event in time has an origin. Of it surely one may debate whether its origin is *svataḥ* or *parataḥ*. But the same could not be said of its truth. The knowledges of fire as fire may come and go, but *vahnitvavati vahnitvaprakāra katva* is what is common to them

all, and surely it is not some thing which may be said to have an origin in time.

It would seem therefore that the entire *utpatti* thesis about truth (as distinguished from true knowledges regarded as events) is misconceived, and solutions either way—the *svataḥ* or the *papataḥ*—are equally pointless. It must be said though that the *svataḥ* theory at least sees part of the truth, namely that truth does not originate separately. It fails to see at the same time that truth does not originate at all, and in this sense is intrinsic to a knowledge. I think a consistent advocate of the *svataḥ* theory should refuse to admit the very problem of *utpatti*.

Considered in the light of these remarks, the entire controversy about *guṇa* vrs. *doṣābhāva*, namely, whether truth is caused by special excellences or if it is caused by the general causes of knowledge plus mere absence of frustrating circumstances, seems wide of the mark, the arguments and counter-arguments being offered more out of zealous attachment to official dogmas rather than out of any consideration of the facts themselves.

Let us now have a look at those arguments and counter-argu ments themselves, not so much to decide whether they are valid or otherwise, but to see their relevance and phenomenological basis.

First, there are the following arguments. If mere absence of *doṣa* were the cause of true knowledge, then, argues the Naiyāyika, it cannot be explained why in the case of the knowledge 'The conchshell is yellow' there should be true apprehension of the conchshell as a conchshell in spite of the presence of *doṣas* like defects in the visual sense-organs. Further, *doṣas* are of an infinite number, and absences of them would be equally numerous. Would it not be more economical if instead of such an array of them we admitted a few *guṇas*?

'But', xreply the Mīmāṃsakas, 'it is no better with the *guṇa*-hypothesis. You hold that in perception, the *guṇa* is *bhūyovayav-asannikarṣa* or contact of the senses with the parts of the object. But even if such contacts were there, presence of *doṣas* like defects in the sense-organs frustrates the effect, and produces the wrong perception, e.g., of the conchshell as being yellow. The cause of true knowledge is then not a *guṇa* but absence of such frustrating circumstances. As to the superfluity of assumptions, the *guṇa*-hypothesis is worse off. Absence of *doṣa* has in any case to be admitted, and over and above that you admit a *guṇa*'.

It is interesting to note the peculiar nature of the arguments. It is agreed that a knowledge that is erroneous is only partly so, there being always some qualifier with regard to which the knowl edge is true. In the knowledge 'The conchshell is yellow', we have truth with regard to the qualifier 'conchshell-ness' though error with regard to the qualifier 'yellowness'. Now to argue, as the Naiyāyikas do, that if in spite of the presence of *doṣas* the knowledge could be true with regard to one of its qualifiers then the absence of *doṣa* could not be a cause of truth, is to overlook the fact that a *doṣa* is a *doṣa* only in a certain context, that the *doṣa* which distorts colour vision is not usually a *doṣa* with regard to recognition of substances. There is then absence of *doṣa* so far as the perception of the shell is concerned, and understanda bly there is truth so far. Similarly, what is *guṇa* is so only in a certain context and may not be so in another. What is *guṇa* then insofar as perception of a conchshell as a conchshell is con cerned is not a *guṇa*, insofar as it does not guarantee the truth, insofar as colour perception is concerned. One may then point out as against the Mīmāṃsaka that the *guṇa* which could gen erate a right perception of the colour of the conchshell was really absent, and there were *doṣas* of course in addition; hence the aberration.

The Naiyāyika continues to argue, however. If a true knowl edge is caused by absence of *doṣa* plus the generic causes of knowledge, then does not the Mīmāṃsā thesis amount to accept ing that the origin of true knowledge is *parataḥ*, for it amounts to introducing an extra factor other than the generic causes of knowledge? But the Mīmāṃsaka replies that it need not be so interpreted. When he denies that there is any extra factor, he is simply denying the agency of any other *positive* factor. Absence of *doṣa* however is a negative factor and so. the supposed self-contradiction does not exist. Some Mīmāṃsakas are more cautious. They point out[108] that though there is absence of *doṣa* in the case of a true knowledge this absence is not to be counted as a cause of the true knowledge. Its sole function is to render error impossible; in that case, the true knowldege would arise out of the same conditions as also produce the knowledge itself. They may even go so far as to hold that *guṇas* may also be present, but the function of the *guṇas* is merely to prevent *doṣas* from coming in; in any case neither the *guṇas* nor the absence of *doṣas* could be counted as the causes of the true knowledge.

The Naiyāyika has two replies to all this. He may in the first place say that there is no reason why an absence should not be a cause. Secondly, he may remind the Mīmāṃsaka that sometimes the *doṣa* itself is a negative factor, e.g. absence of light in visual perception. But in that case the absence of the *doṣa*, being the absence of an absence, would be positive so that if it were admitted to be the cause of a true knowledge, truth would be *parataḥ*.

The arguments are again extremely unhelpful, and one is left with the suspicion that if both *guṇas* and absence of *doṣas* are present in the case of a true knowledge it is very much a matter of decision which one of these is to be ranked as the extra ordinary cause of it and which one as a merely auxiliary, though necessary factor.

The very concepts of *guṇa* and *doṣa* are riddled with difficulties. The Mīmāṃsakas rigthly insist on the fact that there is no generic character of *guṇatva* i.e. no generic property common to all *guṇas* by virtue of possessing which they are *guṇas*. But is it any better with the concept of *doṣa*? Does not the Mīmāṃsaka himself admit that *doṣas* cause errors even though he is not able to produce a satisfactory definition of what makes a *doṣa* a *doṣa*? If so, why should he object to the Naiyāyika's contention that *guṇa* is the cause of a true knowledge, even though a satisfactory definition of *guṇa* is similarly lacking?

Gaṅgeśa's strongest argument, the one with which he begins his chapter on the origin of truth, is however this: there is no generic effect which is unaccompanied by specific characters.[109] There is no man in general, there is either an Indian or an Englishman. There is no knowledge in general, there is either true knowledge or false knowledge. Therefore, there is no generic cause as such. The generic cause is always accompanied by the causes of the species. There is no cause of knowledge in general without there being also those specific factors which give rise to either truth or error. Where there is neither *guṇa* nor *doṣa* there is not even the causes of a knowledge. Truth and error are the two species of cognition, therefore there must be a difference in their respective originating conditions. "*Tasmāt pramāpramayor-vaicitryāt guṇadoṣajanyatvam*".

The Mīmāṃsaka agrees that there is either true knowledge or false cognition, so that there is no knowledge in general, no knowledge in other words which is neither true nor false. He also agrees that since true knowledge and false cognition are hetero geneous effects, there must be a difference in their originating conditions. Only he construes the difference

in another way. He contends that there is either cause vitiated by defects, or the same cause free from the defects, either *duṣṭakāraṇa* or *doṣara-hitakāraṇa*: in the former case there is error, in the latter case there is truth. There is no quarrel therefore insofar as the principle which Gaṇgeśa uses is concerned, the difference arises in the subsequent application of it. There is however a deeper difference, and this concerns the very conception of knowledge. For the Nyāya, truth and error are two *species* of knowledge. Not so, strictly speaking, for the Mīmāṃsaka. For the *svataḥ* theory, we may say, true knowledge is nota species of knowledge, it is knowledge in the proper sense. Error is not just another species, it is an aberration, a distortion, caused by the presence of vitiating circumstances. The difference then being deeper down than it would seem at the first sight, the arguments and counter-arguments offered may be regarded as of little value ex cepting that they *may* suggest to us where exactly the root of the difference lies. If we can lay our finger on that, we may have made substantial gains.

(*b*) The *jñapti* or apprehension of truth: —

It has been said that for us the issue pertaining to the appre hension of truth is more important and also seems more relevant to theory of knowledge as a whole. We may now turn to the arguments advanced by both the sides to the controversy, our aim being to get down to the roots of the matters.

The main argument of the Mīmāṃsaka against the Nyāya theory consists in showing some kind of infinite regress as a consequence of the theory. This may be shown in various ways. It may be argued that if the truth of a knowledge K_1 needs to be verified by another knowledge K_2, then K_2 can do this job only if it itself stands confirmed, and that needs another knowledge K_3. But this process of validation shall have no end, and we shall need K_4, K_5,…*ad infinitum*. In practice however the Naiyāyika stops short of this, and in doing this he is not con sistent. He contends, for example, that the knowledge that there is water over there before me is confirmed when I go over there and quench my thirst. But he does not see that the quenching of thirst, which confirms the knowledge of water, needs itself to be validated. Or, the Mīmāṃsaka may argue that unless the person seeing water were certain about the truth of what he knows he would not

take the trouble of walking up the distance in order to quench his thirst. Even if in this case he does make an attempt, in cases where the appropriate *pravṛtti* would need great effort a person not certain of the truth of what he knows would not be persuaded to act. He would certainly not act unhesitatingly. There would be no *niṣkampa pravṛtti*. The argument then would be that successful practice cannot confirm the truth of a knowl edge, for the very possibility of unwavering practical behaviour presupposes a prior certainty of the truth of the knowledge which provokes the activity.

To all these arguments, the Naiyāyika may reply in various ways. He may concede, as said earlier, that he is not against ascribing some kind of intrinsic truth to the final confirmatory experiences. He might do so in a somewhat weak sense of 'in trinsic', namely in the sense that in their case there is no possi bility of error, no occasion for doubt, and hence no need for further confirmation. The process of confirmation would thus come to an end. There would be no infinite regress. This I think is a fairly good reply so far as it goes. The Naiyāyika is not in consistent in holding this view for he may, as also pointed out earlier, suitably modify his thesis and restrict it only to those cognitions which provoke activity and which have not yet become familiar. In all other cases he may concede an intrinsic truth in rather weak sense.

But a more interesting reply is suggested by Gaṅgeśa (para 52). The Mīmāṃsaka's argument makes two presuppositions. It is assumed that a knowledge cannot give us certainty about its own object unless its own truth is ascertained. It is then argued that K_1 cannot give us certainty about its O unless the truth of K_1 is ascertained which would need another knowledge K_2. But by the same logic K_2 cannot ascertain the truth of K_1 unless its own truth were ascertained by another knowledge K_3. Gaṅgeśa rejects this assumption as unfounded. It assumes more than what is warranted by facts. A knowledge whose truth has not been ascertained may very well give us certainty about its own object. K_2 may confirm K_1 without itself being confirmed. We might very well know an object without knowing that our knowl edge of that object is true. To suppose that this is not possible is to assume that every knowledge, to be knowledge, must be known to be true. But this is begging the issue. The Mīmāṃsaka shows an infinite regress in the Nyāya position only because he impli citly assumes

the truth of his own position. Given the Nyāya conception of knowledge, the supposed consequences do not follow.

The other presupposition of the Mīmāṃsaka's argument is the belief that a knowledge can give rise to unwavering activity only if the truth of the knowledge has been ascertained. Certainty about the truth of a knowledge is a necessary condition of the possibility of unwavering activity appropriate to that knowledge. Gaṅgeśa again rejects this assumption. He again economises and assumes less than the Mīmāṃsaka. It is not necessary that the knowledge should be known to be true. It is enough that it should not be known to be false. A knowledge causes appropriate activity if the knowledge is not known to be false. It need not be, over and above this, known to be true. This again I think is a positive gain in philosophical insight. Ascertainment of the truth of the knowledge may be necessary if the knowledge is followed by doubt about its truth. The doubt has to be dispelled by a certainty. For this, confirmation is needed. But otherwise we may do without confirmation.

Against this contention of Gaṅgeśa two kinds of objections have been raised.[110] It has been urged in the first place that if truth is not apprehended and if falsity also is not apprehended then there would be doubt and therefore no unwavering activity. But I do not think this objection is tenable. Doubt of course requires amongst other conditions non-perception of the two alternatives (*viśeṣādarśand*), but it does not follow that where there is non-perception of two mutually contradictory properties there would be doubt. It is also necessary that the two alterna tives should be remembered. Gaṅgeśa is not contending that the two possibilities of truth and falsity are remembered but neither of them is perceived. He is only saying that a primary knowledge causes appropriate activity if it is not simply known to be false. This does not transform it into a doubt about its own truth! It is also argued that the Naiyāyika is actually exposing himself to an objection which he usually urges against the Prābhākara school of Mīmāṃsā. It is well known that according to the latter error is not a positive cognition but really consists in two different cognitions plus a non-apprehension of their distinction. As against this the Naiyāyikas urge amongst other points that mere non-apprehension of distinction cannot cause *pravṛtti*. What is needed is a positive apprehension of relation. Now however the Naiyāyikas themselves seem to be contending what they have else-where regarded as impossible. They now say that *pravṛtti* is caused by

mere non-apprehension of falsity! I do not think that this point is worth much, for the analogy between the two cases is not correct. For the Prābhākara the cause of *pravṛtti* is mere non-apprehension. For the Naiyāyika, the cause of *pravṛtti* is a posi tive knowledge plus a non-apprehension of its falsity, not a mere non-apprehension.

Gaṅgeśa thus effectively answers the charges of the Mīmāṃsaka. But he does more: he turns the table back upon the Mīmāṃsaka and levels the same charge of infinite regress against him (para 52). Without stopping to consider these we may turn to consider the Naiyāyika's arguments against the Mīmāṃsaka.

One common objection against the *svataḥ* theory of appre hension of truth is that if a knowledge were right from the beginning known as true then it could not subsequently be discovered to be false. This objection would have been decisive if it was combined with the *svataḥ* theory of the origination of truth. For if truth did really originate in it, it could not later on turn out to be false. Taken merely as a theory of knowledge of truth, the objection is not tenable. It may be replied that though a knowledge is always at first apprehended to be true, it may, owing either to the discovery of a *doṣa* in the cause or to sub sequent contradiction, be afterwards found to be false.

The main argument of Udayana and Gaṅgeśa against the *svataḥ* theory is a special case and a stronger version of this objection, and therefore should be considered separately. Doubt is a kind of *apramā*. The objection now runs as follows: if a knowledge were known for certain to be true right from the beginning, it could not possibly be doubted—soon after the origination of that knowledge—whether the knowledge is true or not. And yet we do sometimes, especially in the case of knowl edges of an unfamiliar kind, doubt, immediately after having the knowledge, whether the knowledge is true or not. Such doubts which do undoubtedly take place cannot be accounted for if every knowledge were initially known to be true, i.e. if knowledge of a knowledge always amounted to certainty about its truth. For detailed statement of the argument see Gaṅgeśa's text below, paras 22ff., and our notes thereon. For our present purpose only a few of the salient points of the argument may be stated. In the first place, not all doubt about the truth of the knowledge is claimed to be unexplained in the theory. Of course, doubts which arise later on after the first knowledge of the knowledge has disappeared may well be accounted for, for there remains

nothing which may render them impossible. In fact, if the *svataḥ* theory be stated, as it has been by Gaṅgeśa in 7, as maintaining that truth is apprehended by all those knowledges of the knowl edge (whose truth is under consideration) which do not apprehend the falsity of the knowledge, then all doubts about the truth of the knowledge would be excluded from the purview of the thesis, and there would remain no inconsistency in maintaining both that truth is known *svataḥ* (in the above sense) and that we may later on doubt or deny it. But the doubt which immediately follows upon the origination of a knowledge raises a special difficulty. It is to be preceded by a knowledge of the knowledge, and the latter yields, according to the *svataḥ* theory, a certainty about truth. Such certainty cannot be *immediately* followed by doubt, for the former is a *pratibandhaka* of the latter. Later on after this certainty disap pears in the third moment after its origination (in accordance with the Nyāya metaphysics) there may very well be doubt.

The Mīmāṃsakas, it must be said in all fairness, have given what from their own point of view may be regarded as satisfactory replies to this seemingly formidable objection. The replies may be listed as follows:—

1. The objection presupposes that it is one of the necessary but not sufficient conditions of doubt that the substantive (*dharmi*) of the doubt— the *this*, e.g., in the doubt 'Is this a man or not?'—should be perceived. Now the Mīmāṃsaka may very well deny this assumption. He may contend that all that is necessary is that there should be a contact of the senses with the substantive (*dharmīndriyasannikarṣa*), and provided the other necessary conditions are present there would be doubt without there being a separate knowledge of the substantive. Gaṅgeśa considers this reply but sets it aside in 25 on the ground that unless knowledge of the substantive were a necessary condition of doubt, it cannot be explained why there should be *dharminiyama* and *koṭyutkaṭatva*. As regards '*koṭyutkaṭatva*' it is a highly controversial matter, and not all Naiyāyikas agree that it does characterise doubts. But certainly *dharminiyama* can be accounted for even on the assumption that doubt is preceded by simply contact of the *dharmi* with the senses and not by a separate knowledge of the *dharmi*. The fact that though the senses are in contact with various objects yet doubt arises only with regard to one of them and not with regard to the others may be explained in the same way in which the Naiyāyika explains the fact that though there is simultaneous contact of the senses with various objects yet only one of

them is perceived and not the others. Another knowledge of the object need not intervene between the contact and the resulting doubt. In that case the main back bone of the objection is broken.

Gaṅgeśa however seeks to rescue the argument. The plea that doubt requires sense contact and not a knowledge of it can be advanced only by the Miśra school which believes in an introspec tive apprehension of knowledge. The Bhāṭṭas certainly cannot take the help of this plea, for on their view knowledge is super sensible. The Prābhākaras also cannot, for they have to accept knowledge of the knowledge which on their view would also amount to knowledge of its truth. Secondly, even if *dharmisannikarṣa* were enough for doubt there would be no way of avoid ing further troubles. Gaṅgeśa appeals to the rule (see text para 23, and notes thereon) that if certainty about a thing acts as hindrance to another thing, then the conditions of that certainty would also act as hindrance to the same. If certainty about the truth of a knowledge would hinder the rise of a doubt about the same, then the conditions of that certainty would also serve the same purpose. Now sense contact with the knowledge is a condition of knowing it and so also a condition of certainty about its truth. Therefore, even if no separate knowledge of knowledge is needed, the sense contact with the knowledge would suffice to ward off the said doubt. The Mīmāṃsaka may not however accept the validity of the rule to which Gaṅgeśa appeals, but in that case Gaṅgeśa drives him to swallow unpalatable consequences (see especially note 23.5).

2. The Mīmāṃsaka may then fall back on another reply. He may say that where both the conditions are present, the condi tions of doubt and the conditions of certainty, it is the former which, being stronger of the two, would prevail. For Gaṅgeśa's reply, see 23 again, I do not think the argument is of any worth. The conditions of certainty being present, the conditions of doubt cannot be present. Both the sets of conditions cannot be together present. In the present case, the conditions of certainty of the truth of the knowledge are the first to come into the picture. Therefore there is no ground in suggesting that the conditions of doubt are also present.

3. Another reply is possible exactly on the lines of that given to the generalised Nyāya objection mentioned at the beginning. It may be said that though truth is apprehended yet owing to the presence (or, discovery of) some *doṣa* there again arises doubt about the same. Gaṅgeśa's reply is threefold. First, the case of seeing the conchshell yellow in spite of a prior

certainty that it is white is very different from the present one (26.2). Secondly, while a perceptual certainty to the contrary is needed to annul a wrong perceptual belief, yet any prior certainty acts as a hindrance to doubts (26.3). Finally, there are all the diffi culties around the notion of *doṣa* (27.1).

4. A more interesting way out is then considered by Gaṇgeśa (27). Let truth be known. But this knowledge of truth itself may come to be doubted. Let the first knowledge be K_1 and its truth T_1. Now suppose T_1 is apprehended by K_2. The problem is, how after this it is possible to have the doubt "Is K_1 true or not?" The present solution is this: We first have doubt about the truth of K_2 Doubt in the truth of a knowledge causes as a rule doubt about the reality of its object. If K_2 is doubted, as a con sequence T_1 which is its object would also be doubted, and this is precisely what was to be accounted for. Again, here Gaṇgeśa's objection is effective: The case with K_2 is no better than that with K_1. K_2 is also known to be true *svataḥ*, and it is equally inexpli cable how its truth could come to be doubted soon after.

The above discussions show that Gaṇgeśa's argument is strong and offers the Mīmāṃsaka a formidable challenge. But the argu ment certainly rests on ontological assumptions which weaken its otherwise seemingly unanswerable challenge. Gaṇgeśa assumes that we do have such doubts. No doubt we have some time or other doubts about the truth of some knowledge we had. But any such doubt does not interest Gaṇgeśa. He assumes that we have doubts about the truth of a knowledge immediately after— i.e. in the second, third, and fourth moments after (according as we are dealing with the Prabhākara, Miśra and the Bhāṭṭa views respectively)— the origination of the knowledge. Now that there are such doubts at any one of these moments after the knowledge and not somewhat later, is not an empirically verifiable hypothe sis. We may have doubts very soon after. But how to make sure that the doubt arises in the third moment after the origination of the knowledge? The difficulty is due to the peculiar conception of moment. Distinctions of moment are not discernible differences. There is the further metaphysical doctrine that a knowl edge has a life history of three moments. Leaving this latter belief aside, the way the argument is made to depend on the sup posed fact that there do occur doubts of the said kind in the third (or second, or fourth) moment after the

origination of the knowl edge makes it vulnerable to attacks from that quarter. It would not do to say that there occur doubts very soon after, for it may always be maintained without the risk of empirical evidences to the contrary that the doubts which occurred very soon after were really several more moments after, let us say, five, six, or seven, and never in the second, third or the fourth moment!

There are two other arguments of the Naiyāyika. Of these two the last one is in our opinion the most important argument. In the first place, it is urged that since truth is a related entity, a *viśiṣṭa* object in which the two components of '*tadvadviśeṣyakatva*' and '*tatprakārakatva*' limit and determine each other, it cannot be apprehended unless the related terms are previously appre hended in precisely those characters in which they are related. It has been said earlier that the Miśras who regard truth as knowable by *anuvyavasāya* understand by 'truth' nothing more than *tadvadviśeṣyakatve sati tatprakārakatva*. Now this is a loose co existence of two different entities each of which is knowable by *anuvyavasāya* even on the Naiyāyika's view. But this as we have seen is not a good definition of 'truth'. Truth must at least be *tadvadviśeṣyakatvāvacchinnatatprakārakatva*, and this cannot be apprehended unless the component terms '*tadvadviśeṣyakatva*' and '*tatprakārakatva*' are previously known. Now on the *svataḥ* theory truth is known either by the knowledge itself, ox by its *anuvyavasāya* or by the inference from *jñātatā*. But none of these is qualified to fulfil the necessary requirements. The *anuvyavasāya* or the self-revealing knowledge itself may apprehend its own '*tadvadviśeṣyakatva*' and '*tatprakārakatva*' but precisely for that reason they are not qualified to apprehend the related-ness of these two entities. This point has been most forcefully and elaborately worked out in the recently published *Prāmāṇyavāda* of Harirama.[111]

The Mīmāṃsakas may avoid this difficulty in either of two ways. They may, like the Prābhākaras, insist that truth is mere '*tatprakārakatva*' and this admittedly is known *svataḥ*. But this is a notion of truth that applies to errors as well and does not serve to distinguish truth from error. It is therefore useless for us. We are investigating that property which distinguishes true knowl edges from the false ones and is present in common in all true knowledges. '*Tatprakārakatva*' falls short of this test. It is too wide a definition.

The Mīmāṃsakas may accept the definition of the Naiyāyika and proceed to deny the validity of the rule (on which the Naiyāyika depends) that a knowledge of a related whole presupposes knowledge of the relata separately. But this is too fundamental an issue to be decided here. This concerns one of the central prin ciples of the Nyāya theory of knowledge, the principle on which the Nyāya distinction between *nirvikalpa* and *savikalpa* percep tions is based.

This argument however cannot be a decisive one. For if this were the reason why truth in the Naiyāyika's sense cannot be apprehended by *anuvyavasāya* then one has to allow cases where modifications of the Nyāya position seem quite plausible. Thus Harirama refers to a possible case where one has somehow a prior knowledge of both the relata involved. In that case there is nothing to hinder him from apprehending truth in his first *anuvyavasāya*. One can only add that all that the Nyāya theory implies is that truth is not apprehended *only* by *anuvyavasāya*. But this would be a poor compromise indeed. One has to concede also another case, as Pakṣadhara Miśra does: let the first *anuvyavasāya* apprehend the *tadvadviśeṣyakatva* and the *tatprakārakatva*. If this *anuvyavasāya* is followed by the same knowledge of the same object and then there follows an *anuvyavasāya* of it then this second *anuvyavasāya* seems qualified to apprehend truth. Pakṣadhara accepts this possibility[112], and the commentary *Dinakarī* on *Siddhāntamuktāvalī* speaks of it with seeming appro val. Harirama however rejects this on the ground that the first *anuvyavasāya* apprehends the qualifiers and the qualificandum of the first primary knowledge whereas the second *anuvyavasāya* can apprehend similar properties in the second primary knowl edge. Therefore the fact that the first *anuvyavasāya* apprehended the properties of the first primary knowledge cannot be used to support the claim that the second *anuvyavasāya* apprehends its truth.[113] It may be said then that this view of Pakṣadhara does not represent the main trend of the Nyāya view on the matter.

The argument we have been examining is to the effect that truth being a composite relational entity it cannot be apprehen ded unless the component relata have been previously apprehen ded, and that the *svataḥ* theory has no room for this requirement. A variation of this argument is this: a knowledge of the truth of K_1, let us say, would have the form 'K$_1$ is true'. Such a judge

ment is possible only if we have a prior acquaintance with K_1 as well as with its truth. It is therefore by no means possible that the first knowledge of K_1 would also be at the same time a knowledge of its truth. This objection in another form threatens the Naiyāyika's account also. The Naiyāyika holds, as is well known, that truth is first apprehended by an inference. But one of the rules of a valid inference [is that the *sādhya* must be previously known though it need not be known as belonging to the *pakṣa* of this inference, otherwise there would be the fallacy of *sādhyāprasiddhi*. This fallacy now appears to threaten the Nyāya account. If truth is not known beforehand, if it is ascertained for the first time by the inference then the *sādhya* (which is but the truth of the knowl edge concerned) is unknown. Gaṅgeśa makes desperate attempts to solve this difficulty. For these and for our critical comments thereon, see text paras 36–40 and the notes on them.

We may now turn to the last but at the same time in our opinion the most important argument advanced by the Naiyāyika against the *svataḥ* theory. The argument rests on the rule that mind as an instrument of knowledge is incapable of apprehending outer reality independently (*bahirviṣaye manasorasvātantryāt*). A knowl edge is apprehended by the mind, but mind cannot thereby know whether the qualifier of the knowledge really belongs to the object of the knowledge. In other words, the mind is not able to apprehend the *tadvattva* which is a component of '*tadvadviśesyakatva*' which again is a component of the notion of truth. In simpler language, I can know my knowledge 'This is silver' to be true only if I know that the object before me is really a silver, i.e. it possesses silverness. But to know this is to know an outer state of affairs, which the mind by itself cannot do. A knowledge of knowledge therefore as such cannot do this. *Anuvyavasāya* at least cannot do this, and as against the Miśra theory the argument is conclusively effective. We have only to ask how far it is effective as against the Prābhākara and the Bhāṭṭa versions of the *svataḥ* theory. Against the Prābhākara theory that a knowledge apprehends its own truth, we may say that though the knowledge 'This is silver' apprehends itself as having the qualifier 'silver ness' and also as having the qualificandum 'this' limited by 'thisness', yet it does not apprehend that the qualificandum 'this' possesses silverness. The *this* may in fact possess silverness, but the knowledge does not know itself as having a qualificandum which possesses silverness, and that makes all the difference bet ween the primary knowledge and the

knowledge of its truth. As against the Bhāṭṭas we may say with the Naiyāyikas that *jñātaṭā* could not be a mark of truth, for it serves as a mark of true knowl edge and false knowledge alike.

As Gaṅgeśa argues in 33, the form of the *anuvyavasāya* is not 'I know this silver' but 'I have a knowledge of *this* having 'this ness' and 'silverness' as its qualifiers'. For critical remarks on this see notes thereon and also the footnote to 33.1.

We may sum up the matter then by saying that the whole theory of *parataḥprāmāṇya* as advocated by the Naiyāyika, espe cially by Gaṅgeśa, is based on the conception of truth as what we have called a hybird entity containing both epistemic and ontological components. This nature prevents truth from being readily knowable with knowledge of its focus. One has to take recourse to a process of confirmation and validation. *Pravṛtti* or practical activity however does not wait for a successful out come of the process of confirmation, unless of course there has been a preliminary doubt to start with.

V. CONCLUDING REMARKS

We may now put together the insights we have gained from this critical study. It was said right at the beginning of this introdu ctory study that it was possible to look upon the rival schools in sofar as the problem of truth was concerned as in a way supple menting each other. It is likely, we said then, that they are not answering exactly the same questions, that the two points of view do not necessarily clash but may be brought into a happy reconciliation. The apparent contradiction may be due to the fact that they are using the same expressions while in fact giving them different meanings. Both the rival schools are based upon some genuine philosophical insights. Both are appealing to undeniable phenomena. Yet semantic confusions prevail, and where there ought to have been accord of insights there is instead clash of arguments.

We leave aside for the present the ambiguity, equivocation and relativity of the words '*sva*' and *para* Gaṅgeśa has tried his best to remove these and to make their meaning as precise as possible. It goes to his credit to have brought out a common meaning of '*svataḥprāmāṇya*' where there is really a great deal of internal difference amongst the advocates of this theory. But

for us the real key words, the words that give shape to the entire controversy we have been examining are two: '*jñāna*' and '*prāmāṇya*', 'knowledge' and 'truth'. The difference between the two theories lies here: they take '*jñāna*' and '*prāmāṇya*' in differ ent senses and as a consequence have to look upon the relation between knowledge and truth also differently.

'*Jñāna*'—The *svataḥ* theory understands 'knowledge' in a strict sense such that the theory becomes an analytic consequence of its conception of knowledge. It understands by 'knowledge' only-true knowledge. For it *pramā* and *apramā* are not just co-ordi nate species of *jñāna*. If this were so i.e. if true and false cogni tions were co-ordinate species of knowledge then Gaṅgeśa's arguments would have successfully exposed the theory. But the theory is invulnerable to these criticisms just because its under lying assumptions are different from those of the *parataḥ* theory. Now this strict sense of 'knowledge' is maintained in either of two ways. Some deny that there is anything called error strictly speaking. Error and doubt are then sought to be resolved into-components that are, each taken by itself, true. Others, as shown earlier, accept error and doubt as irreducible forms but do not treat them as forms of knowledge. They are regarded rather as pseudo-knowledges, *jñānābhāsas*. In either of these ways, the strict sense of 'knowledge' is maintained intact in the face of recalcitrant phenomena of error and doubt. No wonder that truth should be taken as intrinsic to knowledge. Error then be comes an aberration, not a species of knowledge.

But it is necessary to point out again even at the cost of re petition that what the *svataḥ* theory is doing *is not a mere linguistic stipulation*, an arbitrary recommendation to use the word 'knowledge' in a certain sense. The theory has a strong support from both phenomena and linguistic usage. It is suppor ted by the usage of 'know' according to which *to know is to know the truth*. It is supported by the phenomenological evidence that error is not knowledge but pretends to be knowledge. Error is error only inasmuch as it can successfully pretend to be knowl edge, though its character as error stands exposed along with its pretension.

As contrasted with all this, the *parataḥ* theory takes 'knowledge' in a rather weak sense so as to include within its scope both true knowledge and false knowledge. Even doubt is not excluded. 'Knowledge' then is a generic term which for obvious reasons cannot be defined with reference to what characterises only one species of it. *The word 'belief'* — in spite of all the philo sophical difficulties associated with it—*perhaps better expresses this*

generic knowledge in the weak sense. No wonder then that in this sense truth cannot be an intrinsic character of all knowl edge quâ knowledge. It should also be obvious that a belief *needs confirmation* prior to which it remains a belief, powerful enough to cause appropriate practical response but cognitively still below the rank of true knowledge.

Prāmāṇya—There are three different *types* of concepts of truth to be met with in the different versions of the *svataḥ* theory. There is on the one hand a *psychological* concept according to which a knowledge is true (and not merely taken to be so) if it is not known to be false, if it has not yet been contradicted. There is next an *epistemological* concept which makes truth a purely epistemological property: it may be defined either simply as *tatprakārakatva* (as by the Prābhākaras who need not disting uish it from error) or as *tadvadviśeṣyakatve sati tatprakārakatva* (as by the Miśras who distinguish truth from error, but do not see that truth must have an ontological reference). There is then the definition of truth as simple *jñānatva* which makes it the generic property of all knowledge quâ knowledge. All these de finitions go to make the *svataḥ* theory highly plausible. The last one makes the theory analytically true. The first one makes it psychologically acceptable. The second makes truth knowable by *anuvyavasāya*.

The Naiyāyikas mean something else by truth. It is interesting to note that some advocates of the *svataḥ* theory (like the author of the *Vedāntaparibhāṣā*) explicitly proclaim that the truth which they regard as being *svataḥ* is nothing other than *tadvati tatpra kārakatva*, But in fairness it must be said that in further explica tion of it they must have to part company. Madhusūdana Sarasvatī clearly says that *tadvati tatprakārakatva* is common to both true and false knowledges. It is obvious that he is explica ting itin a sense that is different from the Naiyāyika's.

Both the theories are valid in their own ways, for the word 'true' is predicated of beliefs as well as of knowledge.[114] As pre dicated of beliefs, the predicate 'true' has a significant opposite i.e. 'false' inasmuch as there are true beliefs and false beliefs. But as predicated of knowledge the predicate 'true' has no significant opposite inasmuch as 'false' is nota predicate of knowledge in the same way as 'true' is.

This way of reconciling the two theories is somewhat funda mentally different from some other attempts to do the same.[115] It has been held by many that what the *svataḥ* theory says is that every knowledge has an

intrinsic *claim to truth*, that *prāmāṇya* for this theory is not truth but truth-claim, which has to be accepted unless and until it has been refuted. The Naiyāyikas on the other hand speak of actual truth and not of mere tentative truth-claim. This is indeed a very ingenious device, but I think it is too simple to be true. The *svataḥ* theory, I should think, is talking about truth and not merely of truth-claim. Only it so construes the meaning of 'truth' that the rest of it follows smoothly. Both the theories are concerned with actual truth, though *their notions of truth are different*. It has also been suggested that the *svataḥ* theory is concerned with truth in the unreflective sense, while the *parataḥ* theory with reflective confirmation or validation so that both the theories are correct. There is an unreflective acceptance which does not rule out the need for subsequent validation. I think this way of reconciling the theory fails to account for an important aspect of the *svataḥ* theory, namely for the fact that this theory has no room at all for subsequent validation.

While both the theories are thus in their own ways correct, each of them suffers through confrontation with the other. The dialectics which ensues upon this confrontation tends to distort the original grain of truth in each. Thus the *svataḥ* theory comes to *say* that truth originates from the same conditions as give rise to knowledge quâ knowledge, whereas it ought to have said that truth has no origin at all or that the very question about the origin of truth is nonsensical.

---

1. The idea of 'instrumental cause of a true knowledge' has been subjected to a quite different controversy between the Nyāya and the Bauddha schools.

2. Madhusūdana Sarasvatī, *Advaitasiddhi* (Nirnayasagar edn.), p. 499.

3. Madhusūdana Sarasvatī, *Advaitaratnaraksanam* (Nirnayasagar edn.), p. 32.

4. Pārthasārathi Miśra, *Nyāyaratnamālā* (ed. by Mm. Pt. Gangadhar Sastri, Chowkhamba Saoskrit Series, Bañaras), p. 30–1.

5. *Prāmāṇyavāda* (Kanchi ed.), p. 15.

6. Gaṅgeśa: *"svatastve prāmāṇyavata eva jñānasya grahāt"* (*Prāmāṇyavāda*).

7. Rāmānujācāryya: *"yatra vyavahāravisaṃvādaḥ tatra pūrvajñānasya bhrāntatvam"*. (*Tantrarahasya,* Gaekwad's O.S., p. 3)

8. Rāmānujācāryya: *"yasyām saṃviti yaḥ artha avabhāsate sa tasya viśayaḥ, nānyaḥ asya tatrānavabhāsāt."* (*"loc. cit.*, p. 2)

9. *"tasya sarvasaṃvitsādhāraṇatvāt."* (*loc. cit.*, p. 2)

10. *"anubhutik pramānam"*. (*loc. cit.*, p. 2)

11. *"yatra tu na (vyavahāravisaṃvādaḥ) tatra samyaktvam."* (*loc. cit.*, P. 3).

12. *"na svātantryeṇārtham paricchinattīti na pramāṇam"*. (Śālikanātha, *Prakaraṇa Pañcikā*, p. 42)

13. Jha, *Prābhākara Mīmāṃsā.*

14. I am indebted, in bringing out this threefold sense of 'truth', to P. Sastri's *Introduction to the Pūrvamīmāṃsā* (Calcutta, 1923). It would be seen that I agree with that learned scholar in thinking that it is truth only in the broadest sense of the term that, on the Mīmāṃsā theory, could be *svataḥ*. I however have differed from him in the precise formulation of these three senses. The difference between his analysis and mine may be represented thus:—

On Sastri's analysis:
1. Truth as common to all cognitions (*pramā, apramā* and memory)
2. Truth as common to memory and *anubhūti* (=*bādhakābhāvatva*)
3. Truth as belonging only to *anubhūti* (*bādhakābhāvatva* + *anadhigatatva*)

On my analysis:
1. *Yāthārthya* (common to all awareness quâ awareness of some object)
2. *Prāmāṇya*, as common to all knowledge, right or wrong, but excepting memory (=*anadhigatatva*).
3. *Samyaktva*, as characterizing only right *anubhūti (anadhigatatva + bādhakābhāvatva)*.

15. *Ślokavārtika*, 2.83.
15a. It should be remembered however that though the said inference reveals truth, truth is not inferred. Thus Gaga Bhāṭṭa writes: *"Pramātvasyānanumeyatvāt jñānānumāne samānasaṃvitsaṃvedyatayā jñānatvavatpramātvasya svatastvasaṃbhavāt"* (*Bhāṭṭacintāmaṇi*, p. 13).
16. *Ślokavārtika*, 2.53.
17. Sastri, loc. *loc. cit*., 68–9.
18. It must be remembered that the Bhāṭṭa unlike the Prābhākara does distinguish between right knowledge and error so that his account of *prāmāṇya* should be expected to distinguish the one from the other.
19. *Ślokavārtika* with the commentary of Umbeka (Madras Univ. Sanskrit Series, no. 13, 1940), p. 54.
20. "*Ajñataviṣayakaṃ bādhakajñanarahitajñānaṃ pramā*". (*Bhāṭṭacinta-mani*, p. 13)
21. "*Na jñānasaṃbandhitvena prāmāṇyaṃ gṛhyate iti brūmaḥ, kiṃtu viṣayatathātvaṃ tadvijñānasya prāmāṇyarn tannibandhanatvājjñāne prāmāṇyabuddhiśabdayoḥ, tat ca ajñātādeva jñānāt svata eva gṛhītamityanarthakaṃ pramāṇāntaramiti*". (*Nyāraratnākara* on *Ślokavārtika*, edtd. by Ram Sastri, Benares, 1898, p. 71)
22. *Nyāyaratnākara*, p. 61. Again *Nyāyaratnamālā*, p. 33 (Banaras edition, 1900): "*arthātathatvamidameva hi jñānasya prāmāṇyam*"
23. Pārthasārathi recognizes this in *Nyāyaratnamālā*. To the question whether truth also belongs to memory, he replies that strictly speaking it does not, but in the context of the present discussion (*asmin tu prakaraṇe*) truth is taken as what is common to right knowledge and memory. For, he goes on to tell us "*ananusandhīyamānatvaṃ tadayogānupalabdhigamyatvena na jñānasvarūpād gamyate*" (p. 35). The knowledge of a jar, for example, does not tell us that it is knowledge of what has not been previously apprehended.
24. "*Sarvavijñanaviṣayamidam*" (*Nyāyaratnamālā*, p. 35). Also: "*jñānamātraṃ tu adhikṛtya svataḥ prāmāṇye parataścāprāmāṇye sādhyamāne*" (*ibid*, p. 35).
25. Compare Gaṇgeśa in *Prāmāṇyavāda*, Gāgā Bhaṭṭa's *Bhāṭṭacintāmaṇi*, Viṣvanātha's *Siddhāntamuktāvalī* etc.
26. Thus Gāgā Bhaṭṭa: "*Murārimiśrastu ghaṭādijñanottaraṃ ghaṭaṃ jānāmītyādyanuvyavasāyo jāyate tena ghaṭatvavadviṣeśyakaghaṭatvaprakārakarūpaprāmāṇyagraha ityāhuḥ*". (*loc. cit*., p. 19)

27. "*Viśayanirūpyaṃ hi jñānam ato jñānavittivedyo viśaya iti vyavasāye bhāsamāne dharmadharmivat tadvaiṣiṣṭyamapi viśayaḥ". (Prāmāṇyavāda)*

28. Cp. *Advaitasiddhi*, p. 311.

29. Thus *Advaitasiddhi: "sākṣijñānasya bhramapramāsādhāraṇatvena"* etc. (p. 351).

30. Thus, for example, Vācaspati Miśra: "*Abādhitānadhigatāsandigdhabodhajanakatvaṃ hi pramāṇatvaṃ pramāṇānām*" (*Bhāmatī*, 1–4).

31. "*Vyavahārakālābādhyatva*" (*Advaitasiddhi*, p. 351).

32. "*Bhāvikālabādhatadabhāvau ca na mānaṃ vinā sākṣiṇā grahītuṃ ṣakyate tasya vidyamānamātragrāhitvāditi*" (*ibid.*, p. 35). *Gauḍabrahmānandī* admits that validity also in the sense of *viṣeśyavṛttyaprakārakatva* (i. e. the property of not having a form e.g. 'snakehood' which does not reside in the substantival object, e.g. in a rope) is not apprehended *svataḥ*, the reason apparently being that such a property consisting of a double negation cannot but be the object of subsequent deliberation (*Advaitasiddhi*, p. 312).

33. This future uncontradictedness is not to be confused with that absolute uncontradictedness (*trikālābādhyatva*) which belongs only to Brahman and which cannot be apprehended by any means (*Advaitasiddhi*, p. 499). The latter is called *tāttvikaprāmāṇya* or metaphysical truth and is distinguished from empirical truth. We are here concerned only with empirical truth. But in what precise sense of truth is empirical truth *svatogrāhya*?

34. "*nāpi prāmāṇyamarthaparicchedasāmarthyaṃ kāraṇaguṇajñānātparatovagamyate*" (Viz. ed., p. 102). "*Prāmāṇyaṃ nāma jñānasyārthaparicchedasāmarthyam*" (*Vivaraṇaprameyasaṃgraha*, Vasumatiedition, Bk, II, p. 223).

35. "*Tathāpi tadvati tatprakārakajñānatvaṃ tadvati tadvaiṣiṣṭyajñānatvaṃ vā prāmāṇyaṃ tacca jñānagrāhakasāmagrīgrāhyam*". (*loc. cit.*, p. 110)

36. Madhusūdana Sarasvatī, *Advaitaratnarakṣaṇam* (*Advaitasiddhi* edn., pp. 29–30). Compare also a modern writer Anantakrishna Sastri: "*yadyapi vedāntinām mate tadvati tatprakārakatvarūpam prāmāṇyaṃ bhramasādhāraṇameva, tathāpi saṃvādipravṛttijanakatvaviśiṣṭaṃ tat na tatsādhāraṇamiti* (*Paribhāṣāprakāṣikā* on *Vedāntaparibhāṣā*, Calcutta 1927, p. 263).

37. One reason for this may be that the Advaitin admits a false object which is the object of false apprehension, so that e.g. the false silver does possess the generic character of silverhood.

38. This is the suggestion of Anantakrisna Sastri in the passage quoted in footnote 37.

39. *Gauḍabrahmānandī* recognizes that the simple property of causing an activity—and the activity, we may add, may also be *niṣkampa*—is common to right knowledge and error: "*pravṛttiprayojakatvarūpaṃ... pramātvaṃ bhramasyāpi vidyate*". Hence the qualification should be: "the property of causing successful activity". (*Advaitasiddhi*, p. 319)

40. "*Prāmāṇyam vyavahārakālāvacchinnasya mithyātvaniścayāviśayatvasya ya āśrayaḥ tadviśayakadhīsvarūpam*". Again: "*Mithyātvena ajñātaṃ yat tadviśayakajñānatvarūpapramātvasya jñānasāmānyagrāhakasākṣigrāhyatvarūpasvatogrāhyatvasambhavāt*". (*Advaitasiddhi*, pp. 351–352)

41. "*Ajñātārthaniścayātmakatvameva prāmāṇyamasmatpakṣe*". (*loc. cit.*, p. 32)

42. See footnote 40 above.

43. "*Apramāyā ajñānavirodhitvarūpajñānatvābhāvena...*" (*loc. cit.*, 33).

44. "*Na hi hetvābhāso heturbhavati, tadvanna jñānābhāsasya jñānatvam*" (*loc. cit.*, p. 33). For the Naiyāyika, this is not so. Hence the Naiyāyika would regard *pramātva* as belonging only to one species of knowledge and not as coextensive with *jñānatva*.

45. "*Na ca jñānasāmagrīmātrajanyatve apramāpi pramā syāditi vācyaṃ; tasya jñānasāmagrījanyatvābhāvāt. Na ca—evaṃ sati sa jñānamapi na syāditi vācyaṃ, iṣṭāpatteḥ*". (*loc. cit.*, p. 34)

46. "*Jñānamātre jñānatvavat pramātvasyāpyanugamāt sāmānyasāmagrīmātraprayojyatā...*. (*loc. cit.*, p. 34)

47. The late K.C. Bhattacharyya has proposed a similar theory in his paper "Knowledge and Truth", included in the Second Volume of his *Studies in Philosophy* (Calcutta, 1958). Thus he writes:

"Two propositions may be stated about knowledge—that knowing is known only as implied in the explicit awareness of truth and that truth is asserted only of a content that is known. Knowledge and truth have to be defined in terms of each other", (p. 154) Again, "There is…no such thing as false knowledge" (p. 157), so that "if it now appears to be not true, it is never said to have been known but taken at best to have been believed" (p. 158).

48. A.J. Ayer, *The Problem of Knowledge* (London, 1956), Ch. I.

48a. In the Indian *svataḥprāmāṇya* theories this 'right to be so sure' need not be apprehended *ab initio*.

49. *Ibid*, p. 22.

50. Thus the late K.C. Bhattacharyya bases his suggested definition of 'knowledge' in terms of 'truth' upon the phenomenological evidence that knowing is known never as an "indifferent psychical fact", but always as "the implicate of the awareness of truth" from which it follows that truth "cannot be taken simply as additional confirmation of what already is known indifferently". (*loc. cit.*, p. 157).

51. Thus, for example Pārthasārathi in *Nyāyaratnamālā* accepts the intrinsic character of truth only with regard to its apprehension.

52. *Nyāyadarśana* (Calcutta Sanskrit Series), p. 193.

53. Thus Jayanta:'*Na hi kriyāsvabhāvaṃ jñānamapi tuphalasvabhāvameva*' (*Nyāyamañjari*, Chowkh. ed., p. 16).

54. This second point needs emphasis. The Nyāya ontology is not a defence of ordinary usage, but a system constructed with its own categories and their definitions. For the idea of such an ontology, see N. Goodman, *The Structure of Appearance* (Cambridge, Mass., 1951).

55. Udayana: *"Arthenaiva viśe□b hi nirākārataya dhiyam" (Kusumāñjali*, 4.4).

56. Thus Vācaspati: *"tasmādarthapravanebhyo jñānebhyastadapravanatayā bhinna-jtīyāh sukhdāayo... ". (Tātparya□īkā*, p. 108)

Also Vallabhācārya: *"jñānatve cecchādivyāvṛttasvabhāvasya viṣayapra-vanatvamapeksitamitu" (Nyāyalīlāvati*, Chowkh. ed., p. 814)

57. Śaṅkara Miśra: *"icchādau tu jñānaupādhikaṃ tat". (Kaṇṭhātharana* on *Nydyālĕlāvati*, p. 812)

58. Thus, *"Buddhirupalabdhijñānamityanarthāntaram" (Nyāya Sūtra* 1. 1.15). Also, Vācaspati: *"buddhehi svābhāvikaṃ caitanyamāstheyam" (Tātparyaŭīkā* on 1.1.15). Vallabha: *"pakrāśo buddhiḥ". (loc. cit.*, p. 408)

59. See on this point Kalidas Bhattacharyya, "The Indian Theories of Self and Knowledge" (*Our Heritage*, Vol. 2, Part II, especially pp. 221–223). Also B.K. Matilal, *Perception, An Essay on Classical Indian Theories of Knowledge*, Oxford, Clarendon Press, 1986, esp. ch. 9.

60. This view is generally attributed to the author of *Ratnakoṣa*, an extinct work.

61. Thus Uddyotākāra: *"Yadi guṇaḥ sa na sādhāraṇaḥ" (Vārttika* on 1.1.23).

62. Ingalls seems to hold that the Nyāya analyses, not propositions but, cognitions (*loc. cit.*, pp. 33–4). In the light of what I have said above, I should like to hold that the Nyāya does not distinguish between proposition and sentence on the one hand and knowledge and proposition on the other. It does distinguish between knowledge and sentence. What it analyses then is as much a knowledge as a proposition, but then not the self-subsistent proposition. More accurately, therefore, it analyses cognitions that are propositional in character if they are of the *savikalpa* sort. Whether a *savikalpa* knowledge is, according to the Nyāya, *necessarily* linguistic or not is a difficult problem. This much seems certain that, in the first place, it *can be* expressed in a sentence and, secondly, that it admits of a logical analysis (and so may be said to be propositional).

63. Contrast Kalidas Bhattacharyya, *loc. cit., Our Heritage*, Vol. 2, Part II.

64. The merely reflective awareness or *anuvyavasāya* does not explicitly yield the analysis (but gives us the datum for analysis). Analysis therefore requires a different attitude. For an independent development of such a notion of content, see my "Remarks on the Content Theory" in the

Visvabharati Journal of Philosophy, Vol. 2, No. 2 (Reprinted in *Phenomenology and Ontology*, The Hague: M. Nijhoff, 1970).

65. Kalidas Bhattacharyya, *Our Heritage*, Vol. 2, Part II, p. 228.

66. For the Nyāya, *viṣayatāsambandhena jñānaṃ prati tādātmya-sambandhena nirvikalpakaṃ pratibandhakam*.

67. Lest it might be objected that '*viśayatā*' is only a generic name for *viśeṣyatā, prakāratā*, etc. and hence in the absence of any of the latter, there is no point in claiming that there still is a *viṣayatā*, some Naiyāyikas uphold the view that there is an additional *viṣayatā* over and above *viśeṣyatā, prakāratā*, etc. (*atiriktaviṣayatāpakṣa*). Cf. Gaṅgeśa, *Prāmāṇyavāda* (Kanchi edn.), p. 228, and note 41.1 in the text below.

* A terminological Note: in consistency with remarks made in the preceding paragraphs, it hardly needs to be said that when we speak of the 'pot' being a qualifier (in the knowledge 'the floor with the pot'), what is meant is that the knowledge-content referring to the pot belongs to the specific type called *prakāratā*.

68. Another such example of the way the Nyāya analysis goes beyond the linguistic is provided by its attitude towards the relational component of a knowledge (*saṃsargatā*). The relational component in knowledge always remains unmentioned. Conversely, if a relation finds mention, it ceases to be a relational component in the knowledge. In 'The hill is fiery' ('*parvato vahnimān*') the unmentioned relational component is '*saṃyoga*.' But in the knowledge 'The hill has *saṃyoga* with fire', *saṃyoga* no more functions as a relational component but has got metamorphosed into a qualificandum and/or a qualifier. The relational component now refers to the unmentioned relation of *samavāya*.

69. This is why some Naiyāyikas speak of a total unanalysable *viṣayatā* which is more than its components and which intentionally refers, as it were in one act of intention, to the total object i.e., in the above example, to the floor-as-possessing-the-pot. This unanalysable unity has been called '*vilakṣaṇa viṣayatā*'. It is absent in the case of error, for in error there is no total related object. There is nothing like the-this-as-qualified-by-silverhood in the case of the erroneous cognition 'This is silver'.

70. In the Vaiśeṣika literature we find the classification into '*vidya*' and '*avidyā*'.

71. *Nyāyadarśana* (Calcutta Sanskrit Series), p. 8.

72. "*Arthapratītyadhīnā tu pravṛitiḥ na arihāvadhāraṇādhīnā*" (*ibid.*, p. 9).

73. Thus Vallabha: "*Na ca viṣayadharmabhedaḥ, sarvasādhāraṇyāt*" (*Nyāyalīlāvatī*, Chowkhambā edn., p. 766). "*Sarvasādhāraṇyāt*" is explained by *Kaṇṭhābharaṇa* as meaning "*bhramasādhāraṇyāt*". But he also interprets it in another way. If truth were a property of object, then one person Caitra could apprehend the truth of Maitra's knowledge.

74. "*Viṣaye tādṛśadharmānanubhavādityarthaḥ*" (*Kaṇṭhābharaṇa* on *Nyāyalīlāvatī*, p. 766).

75. *Satyatvaṃ na jñānajātiḥ* (*Nyāyalīlāvatī*, p. 766). Also see Udayana's *Pariśuddhi*, pp. 158–9. For critical remarks on this see pp. 48–50 following.

76. *Nyāyadarśana*, p. 24.

77. Vātsyāyana's *Bhāṣya* on *Nyāya Sūtra* 2.1.36.

78. *Nyāyadarśana*, p. 15.

79. *Ibid.*, p. 16.

80. *Pariśuddhi*, p. 46.

81. *Nyāyakusumāñjali Kārikā* 4/1, 4/5.

82. *Nyāyamañjarī* (Chowkh. edn.), p. 12.

83. *Nyāyakandalī* (Viz. edn.), p. 172.

84. *Nyāyalīlāvatī*, pp. 737–738.

85. *Nyāyadarśana*, p. 16 and *Pariśuddhi*, pp. 161–166. Two things are here meant by 'lack of independence of memory'. It is meant, in the first place, that memory reveals what is already known in the past and has no independent capacity for manifesting its object. But dependence in this sense does not go against ascribing to it truth in the ordinary sense. The truth that is denied to memory

thereby must be truth in some special sense. Udayana also seems to mean that the '*yāthārthya*' of memory is dependent on that of the past experience which is being remembered. If the past experience is *yathārtha*, then memory is also so; if the past experience is not *yathārtha*, then memory also is not, even if memory may be faithful to it. I think it is being unfair to memory.

86. For this notion of *avyāpyavṛttitva* and its opposite, see Ingalls, *loc. cit.*, pp. 73–74.

87. Definitions in the Nyāya are not merely nominal definitions but real definitions in the sense that they are designations of real properties that serve to distinguish the definiendum from all that is other than it. Hence a definiens may be said to designate an entity. In the present case it may be said to designate an entity only when the variable has been given a value.

88. This is the logical significance of the Nyāya dictum that all knowledge is unerring with regard to the substantive (*dharmiṇi abhrāntam*). The Nyāya doctrine referred to above that every false cognition is in some respect at least true must be sharply distinguished from the theory of degrees of truth and falsity as stated by such thinkers as F.H. Bradley.

89. This, it seems to me, is the main difference of Gaṅgeṣa's conception of truth not only from all epistemological and ontological notions but also from the semantic concept of truth of A. Tarski.

90. Thus Mathurānātha explains *'avacchinnatva'* in this connection as *"idametad viśeṣyakatvāṃśe etatprakārakamiti pratītisāksikaḥ svarūpasambandhaviśeṣaḥ"* (*Māthurī*, p. 403).

91. I leave out for the present the position held by some Naiyāyikas, seemingly admitted by Pakṣadhara Miśra and referred to sympathetically by *Dinakarī* that the truth of a primary knowledge may also be apprehended by second *anuvyavasāya*. See p. 66f *infra*.

92. Vācaspati—*"Anumānasya tu.... nirastasamastavyabhicāraśaṅkasya svata eva prāmāṇyamanumeyāvyabhicārilṅgasamutthatvāt"* (*Nyāyadarśana*, p. 9).

93. *"Anumitijñanaṃ hyarthasya tathātvaṃ vyavacchindadevotpadyate"* (*Pariśuddhi*, Asiatic Soc. ed., p. 113).

94. Udayana's *"Atyantāyogavyavaccheda"* (*Pariśuddhi*, p. 120) is thus explained by Vardhamāna in his *Prakāśa* on it: *"kutrāpi svatogṛhyate ityarthaḥ"*. For Gaṅgeśa's opinions on this, see para 55 of the text.

95. Thus the *hetvābhāsas* are defined in *Siddhdntāmuktāvalī* as those which by being known oppose inference (*Yadviṣayakatvena jñānasyānumitivirodhitvam*).

96. Or, as Vācaspati says, *"gṛhītdvybhicāraliṅgasamutthaṃ niṣkampam utpadyate jñianam"* (*loc. cit.*, p. 9).

97. So far as the origin of the validity of an inference is concerned, the Nyāya of course advocates extrinsic origin, the special excellence needed being *"sādhyavati sādhyavyāpyavaiśiṣṭyajñānam"* (*Muktāvalī* on *Kārikā* no. 133).

98. *"Na ca phalajñānaṃ parīkṣyate prekṣāvadbhiḥ"* (*loc. cit.* 9).

99. *"Vayantu brūmḥ phalajñānamapi abhyāsadaśāpannatayā tajjātīyatvena liṅgena avadhāritavyabhicārameva"* (*loc. cit.*, p. 9).

100. Thus writes Moritz Schlick about the nature of confirmations: "They are an absolute end. In them the task of cognition at this point is fulfilled…it gives us joy to reach them, even if we cannot stand upon them." "The Foundation of Knowledge", included in Ayer (ed.), *Logical Positivism*. The Free Press, Glencoe, Illinois, 1959). Schlick also writes in the essay that in the case of confirmations "I grasp their meaning at the same time as I grasp their truth".

101. *Pariśuddhi*, pp. 102ff.

102. *Pariśuddhi* p. 105.

103. *Prāmāṇyavāda*, para 50.

104. *Pariśuddhi*, p. 117.

105. *Aprāmāṇyaśaṅkā nāstīti eva svataḥprāmāṇyagrahārthaḥ (Pariśuddhi-prakāśa*, p. 118).

106. Jayanta goes to the other extreme and holds the absurd view that every knowledge, prior to confirmation, has the status of a doubt, but in order to show this he has to stretch the meaning of

'doubt' and has to find an explanation of why it is *not* apprehended as a doubt. *Cf. Nyāyamañjarī*, pp. 156–7.

107. See, amongst others, Udayana's *Pariśuddhi*, pp. 158–159, Gaṇgeśa's *Prāmāṇyavāda*, ch. on *Pramālakṣaṇa*

108. For a discussion of these views, see Mm. Yogendranāth Tarkatīrtha, *loc. cit.*

SHORYU KATSURA

DHARMAKĪRTI'S THEORY OF TRUTH

In the tradition of Buddhist logic and epistemology established by Dignāga (ca. 480–540), Dharmakīrti (ca. 600–660) yielded probably the greatest influence upon succeeding Buddhist and non-Buddhist logicians in India. The aim of this article is to try to reconstruct Dharmakīrti's theory of truth from the remarks on *pramāṇa* (a means/source of true knowledge) scattered in his works.[1] It is to be noted at the outset that by the word 'truth' I do not mean metaphysical or religious truth, such as the Four Noble Truths of the Buddha, but rather empirical truth. For Indian theories of truth (*prāmāṇya-vāda*) deal with empirical knowledge alone[2] and Dharmakīrti in his preserved treatises is primarily concerned with the epistemological and logical problems of our worldly experience. Although the Sanskrit original for the word 'truth', *prāmāṇya*, literally means 'the property of being a means of true knowledge', to Dharmakīrti it means 'the property of true knowledge' (or 'the truth of knowledge') as well. For as we shall see, he insists upon the essential identity between the means of knowledge and the resultant knowlege. Hence the word '*pramāṇa*' in this article carries both the sense of 'a means of true knowledge' and that of 'true knowledge' itself.

If I may state my conclusion first, Dharmakīrti seems to hold two different criteria of true knowledge or truth, one pragmatic and the other purely epistemological. According to the pragmatic criterion which is found in his discussion of the definition of *pramāṇa*, true knowledge should not be contradicted (*avisaṁvādin*) by our experience, but lead to the satisfaction of our expectation towards the object, and the object of true knowledge should be both real and something new. Now, when we closely examine Dharmakīrti's analysis of perception (*pratyakṣa*) – more precisely, sensation – and inference (*anumāna*), the only two kinds of *pramāṇas*

recognized by him, we discover that the former alone is regarded as 'non-erroneous' (*abhrānta*). According to Dharmakīrti, sensation is total and direct knowledge of an object and possesses the true representation of the object, while inference is a partial and indirect understanding of the object because it grasps only one of the many general characteristics of the object. In a purely epistemological sense, sensation alone is free from error and ultimately true because it keeps some real 'correspondence' with the actual object, namely resemblance (*sārūpya*) of the forms or images; inference, however, is ultimately 'erroneous' (*bhrānta*) because it does not grasp an object as it really is. Nonetheless, truth of inference should not be doubted in practice as long as it leads to an expected result. As a matter of fact, from a pragmatic point of view, inference is in a sense truer than sensation, for in order to be pragmatically valuable the latter should be followed by some conceptual knowledge (*vikalpa*) which alone enables us to have some decision (*niścaya/adhyavasāya*) about an object, while the former does not require such knowledge. In what follows, I hope to present as clearly as possible this somewhat complicated theory of truth. However, before embarking on the main discussion, it may be helpful to clarify some fundamental presuppositions of Dharmakīrti's ontology and epistemology.

ONTOLOGICAL AND EPISTEMOLOGICAL PRESUPPOSITIONS OF DHARMAKĪRTI

One of the fundamental doctrines of the Buddhists is that everything is impermanent, except for some 'uncaused/unconditioned' (*asaṃskṛta*) items, such as Nirvāṇa. Dharmakīrti believes this doctrine in its most rigorous form: namely, whatever exists is momentary (*kṣaṇika*) because only momentary existence can produce an effect (*arthakhyā-samartha*).[3] Thus, according to him, to be is to be capable of producing an effect,[4] so that what really exist are innumerable point-instants or moments (*kṣaṇa*) of material objects (*rūpa*) and mental phenomena (*citta*).[5] Such moments are considered to form a sort of natural flow, for each moment is believed to cause the immediately succeeding moment of a similar kind until such a process is obstructed for some reason. For instance, a moment of seed (A_1) causes the next moment of seed (A_2) which in turn will cause the next

moment of seed (A_3); this will continue until a seed of moment i (A_i) with enough maturity produces the first moment of sprout (B_1) with the help of such co-operating conditions (*sahakārin*) as the earth, water, heat, etc. of the moment i.[6] Thus what appears to us as a solid seed that continues to exist at least for some period of time, is, according to Dharmakīrti, actually a series of moments of seeds. Without yogic power, however, we are incapable of recognizing each moment distinctly;[7] hence, we are forced to deal with a sort of apparent continuum (*santāna*) of moments insead of moments themselves.

'Moment' and 'continuum' seem to be the two key words to the understanding of Dharmakīrti's ontology and epistemology. They are characterized by him in the following manner.

(i) A moment is characterized by the causal power (*arthakriyā-śakti*) and regarded as ultimately real (*paramārtha-sat*). A continuum, on the other hand, is a mere conceptual construct imagined by us upon a series of actual moments of a similar kind, and consequently it is not real but fictional. A continuum is characterized by its lack of causal power.

(ii) Each moment is unique in the sense that it is distinguished not only from other moments of a similar kind (say, a seed) but from those of a dissimilar kind (non-seed).[8] Hence it is called 'particular' (*svalakṣaṇa*). A continuum represents some universal or general characteristic (*sāmānya-lakṣaṇa*) common to every moment which constitutes that continuum. It gives rise to our sense of continuity and identity. It is to be noted here that such a continuum of, say, seed-moments distinguished from other continua of seed-moments somewhat corresponds to our concept of an 'individual' seed and that a universal or general characteristic superimposed upon a group of seeds distinguished from non-seeds corresponds to a 'generic class' of seed.[9]

(iii) A single moment is changeless because it cannot be subject to any external influence due to its momentary nature. As for a continuum, however, we can conceive of various kinds of external influence upon it and speak of its gradual change, e.g. the gradual maturation of a seed.[10]

(iv) A moment or particular is the object of sensation, while a continuum or universal is the object of such conceptual knowledge as inference, judgement and verbal knowledge. The former gives rise to a clear image of an object, the latter merely to an obscured image.[11]

(v) A moment or particular is inexpressible because only a continuum or universal can be the object of our verbal expression.[12] Consequently, it is to be noted that whenever I refer to a moment by a word like 'seed', the word is used only in a metaphorical sense, for a continuum of seed-moments alone can be called 'seed'.

In summary, a moment is causally efficient, real, unique, changeless, inexpressible, particular and related to sensation, while a continuum is causally inefficient, ficitional, common or general, changeable, expressible, universal and related to judgement, etc.

According to Dharmakīrti, knowledge too forms a natural, momentary flow. For example, a moment of sense perception is the result of a set of co-operating causes (*sāmagrī*) belonging to the immediately preceeding moment, viz. knowledge, the sense-organ, an object, attention, light, etc.[13] As long as such a set of causes continues to produce additional similar sets, there will arise a series of moments of similar sense perception.[14] It is essential for such a set of causes to be in approximation (*saṁnidhi/pratyāsatti*) in space and time with each other in order to produce their expected result.[15] The resultant sense perception is essentially unique in nature because of its momentariness; yet, it is characterized by a variety of properties due to its variety of causes: it is knowledge because it is the result of the preceeding knowledge, it takes a particular object (say, color) because it is caused by a particular sense-organ (the eyes), it resembles its object because it is the result of that object, and so on.[16] The theory that knowledge resembles its object or knowledge possesses the form or image of its object (*sākārajñānavāda*) is one of the fundamental presuppositions of Dharmakīrti's epistemology. According to him, the object of knowledge should be the cause of knowledge which is capable of projecting its image into knowledge.[17]

If we may focus on the object of knowledge, a moment of the object possesses the causal power to produce a sensation of it in the next moment. It may be called 'particular causal power' of the object.[18] By sensation, the object (say, a seed) is grasped as it really is and with all its specific properties, e.g. seedness, momentariness, reality, roundness, minuteness, brown color, etc. Each of such specific properties, however, is to be grasped in its general form by judgements or conceptual knowledge which follow the sensation.[19] Consequently, it may be said that a moment of the object

possesses a sort of 'general or universal causal power', as well, which produces judgement of a specific property of the object, such as 'this is a seed', immediately after the sensation of the seeed-moment. Such a causal power is 'universal' in the sense that it is common to every judgement of a similar kind. As mentioned above, at the level of judgement we are dealing not with each moment but with a continuum of moments or so-called an individual object, such as a seed, a pot and a fire, and we form some expectations from such objects, e.g. that a seed can produce a sprout, that a pot can contain milk, and that a fire can cook a meal. In other words, in forming judgements, we may superimpose some practicality or the power to fulfill some human purpose (*arthakriyā=prayojana-niṣpatti*)[20] upon a continuum of the object. Such a power seems to correspond to the universal causal power mentioned above.

Although I have mentioned two kinds of causal powers, viz. particular and universal, it is to be emphasized that, at the level of the momentary object, there is only one and the same causal power, i.e. the capacity to produce its result in its natural flow. This causal power of the momentary object is regarded as particular when we are dealing with sensation or moments, while the same causal power is regarded as a universal causal power to fulfill a human purpose when we are dealing with judgements or continua. Thus one and the same momentary object produces both sensation and judgement, and in fact, human activity in general. Sensation grasps that object directly and entirely, judgeme indirectly and partially through one of its many universal characteristics. Yet, only when judgement is made about an object, can activity towards that object become possible.[21] Therefore, in practice, we are able to approach an object not through sensation or a single moment but through judgement or a continuum. Let us now turn to the main discussion.

DHARMAKĪRTI ON THE DEFINITION OF PRAMĀṆA

(Pramāṇavārttika, Chapter II: pramāṇasiddhi, w. 1–6)[22]

§1. THE FIRST DEFINITION OF PRAMĀṆA

Pramāṇa is non-contradictory knowledge (*avisaṁvādi jñānam*). Non-contradictoriness [here] means the existence of the fulfillment of a human purpose (*arthakriyā-sthiti*). v. 1a–c$_1$

§1.1. VERBAL KNOWLEDGE IS PRAMĀṆA[23]

Verbal knowledge (*śābda*), too, [is non-contradictory,] for it indicates an intention [of a speaker]. Verbal knowledge is *pramāṇa* with reference to that which is an object of a speaker's activity [i.e. intention] and which appears in his [conceptual] knowledge. [But its truth (*prāmāṇya*) is] not based upon reality (*tattva*) of the object. vv. 1c$_2$–2

§1.2. CONVENTIONAL KNOWLEDGE IS NOT PRAMĀṆA[24]

Conventional knowledge (*sāṁvṛta*) is not regarded [as *pramāṇa*], for it grasps [merely] what has already been grasped. v. 3a–b$_1$

§1.3. PRAMĀṆA IS NOTHING BUT KNOWLEDGE[25]

Knowledge is *pramāṇa* because it is the main cause of a human activity (*pravṛtti*) towards a thing to be avoided or taken, and because difference of an objective image (*viṣayākāra*) in knowledge causes difference of understanding [of an object], for only when there is the former [difference], does the latter [difference] exist. vv. 3b$_2$–4c

§1.4. ASCERTAINMENT OF TRUTH

Knowledge itself is known for itself, [but] its truth [is known] through an experience (*vyavahāra*). [Then] a philosophical treatise (*śāstra*) [on truth may look useless, yet it] dispels ignorance. vv. 4d–5b

§2. THE SECOND DEFINITION OF PRAMĀṆA

Or [*pramāṇa* is] what reveals a [previously] unknown object (*ajñātārtha-prakāśa*). v. 5c

§2.1. RESTRICTION TO THE SECOND DEFINITION[26]

[Opponents:] "[According to the second definition, conceptual] knowledge of a universal (*sāmānya*) arising after knowing [i.e. perceiving] an object itself would become [*pramāṇa*, which would be unacceptable to Dharmakīrti]." [Answer: The second definition was stated] with the intention that when a particular (*svalakṣaṇa*) is not known, knowledge [of that unknown object may become *pramāṇa*]. For people [who look for the fulfillment of a human purpose] examine [by *pramāṇa*] a particular [alone].[27] vv. 5d–6

Although the above discussion may suggest that Dharmakīrti holds two alternative definitions of *pramāṇa* (Note: 'or' in §2), it should be noted that the two definitions are regarded as interdependent.[28] Thus, to Dharmakīrti, *pramāṇa* is non-contradictory knowledge which reveals an object not known before (§§ 1, 2).[29] In other words, it is (i) knowledge, (ii) non-contradictory, and (iii) refers to a previously unknown object.

(i) PRAMĀṆA IS KNOWLEDGE[30]

According to Dharmakīrti, *pramāṇa* or a means of knowledge should be the most efficient (*sādhakatama*) cause of knowledge. As mentioned before, he believes that a moment of knowledge is the result of a variety of causes,

viz. knowledge, the sense-organ, an object, etc., belonging to the immediately preceeding moment. No one of them, however, is regarded as more efficient than any other. They are, in fact, considered to contribute equally to their common result. Then what is the most efficient cause of knowledge? It is, according to Dharmakīrti, that which ultimately differentiates (*antya-bhedaka*)[31] one knowledge from the other, e.g. knowledge of a cow from that of a horse. In this context, a particular object cannot be regarded as *pramāṇa*, for when it is observed by two persons (A and B), it becomes an object common to them and we cannot differentiate A's knowledge of it from B's. An object is merely one of the variety of causes contributing equally to resultant knowledge. Dharmakīrti proposes that what ultimately differentiates knowledge is the objective image projected into it by the external object (§1.3). Thus, *pramāṇa* or the means of knowledge is nothing but the resultant knowledge itself or, more precisely, an aspect of this knowledge, i.e. its possession of an objective image (*viṣayākāratā*) or its resemblance to its object (*arthasārūpya*)[32] Therefore, from Dharmakīrti's point of view, anything other than knowledge, such as the sense-organ or the contact between the sense-organ and the object, should not be regarded as *pramāṇa*.[33]

It is customary for Indian logiciains to describe the process of knowing an object in terms of four distinct factors, viz. the knower (*pramātṛ*), the means of knowing (*pramāṇa*), the object of knowing (*prameya*) and the resultant knowledge (*pramāṇaphala/pramiti*).[34] Since the Buddhists do not admit the existence of any persisting agent or 'soul' (*ātman*), the knower has no scope in the Buddhist analysis of knowledge. Another unique feature of the Buddhist theory is that it insists upon the essential identity between the means of knowing and the resultant knowledge, as discussed above. Buddhist logicians like Dharmakīrti believe in the most rigorous theory of momentariness and maintain that a moment of knowledge is the result of a sort of natural causal flow. Therefore, only the fact of a moment of knowing an object actually exists and what we call '*pramāṇa*' and 'result of *pramāṇa*' (or the resultant knowledge) are mere mental constructs superimposed upon this fact. Knowledge may be regarded as *pramāṇa* in that it possesses an objective image which decisively differentiates it from other knowledge, or it may be regarded as a result in that it is the knowledge of the object concerned. Consequently, *pramāṇa* and the result are not distinct factors as held by other Indian logicians, but aspects of one

and the same knowledge. As a matter of fact, Dharmakīrti goes on to say that even the object of knowing is nothing but an aspect of the resultant knowledge because all knowledge is self-cognizing (*svasaṁvedana*)[35] This of course leads to the idealistic position that there is no external object, but I will not go into this topic in this article.

So far the problem why *pramāṇa* is knowledge has been dealt with from the epistemological point of view. Dharmakīrti discusses the problem from a pragmatic point of view, too (§1.3). According to him, *pramāṇa* or the means of knowledge should be the main cause of a human activity towards an actual object which is either to be avoided like a poison or to be taken like a piece of gold, and knowledge alone can be the main cause of such an activity, since other alleged *pramāṇas*, such as the sense-organ, do not necessarily lead to such an activity. Therefore, *pramāṇa* is conceived as knowledge in the pragmatic perspective, too.

(ii) PRAMĀṆA IS NON-CONTRADICTORY KNOWLEDGE

Dharmakīrti further specifies *pramāṇa* as non-contradictory knowledge. By 'non-contradiction' he means the existence of the fulfillment of a human purpose (*arthakriyā*) (§1). In other words, knowledge is *pramāṇa* and true if it does not deceive our expectation towards the object of that knowledge. For example, knowledge of water, if true, should be able to lead to real water which will satisfy our expectation by quenching our thirst; it should not deceive us like the knowledge of a mirage. According to Dharmakīrti, whether or not knowledge is true, i.e. the truth of knowledge (*prāmāṇya*), is ascertained by our experience of, or practical activity towards the object of that knowledge (§1.4).[36] In short, to be true is to be uncontradicted by our experience and to be able to lead to the satisfaction of our expectation.

Here a problem arises. If we adopt with Dharmakīrti the rigorous theory of momentariness, the object of knowledge should be different from the object of a practical activity induced by that knowledge, and consequently, the truth of the knowledge cannot be ascertained. This is quite true and perhaps in the strict sense, truth of knowledge cannot be ascertained in any way, for if we deal with the problem in the realm of moments and at the

level of sensation, neither an action in general nor a practical human activity will come under consideration.[37] Nonetheless, it is to be noted that while discussing the nature of *pramāṇa*, Dharmakīrti refers to 'the fulfillment of a human purpose', 'human activity', and 'experience' (§§1, 1.3, 1.4). As noted above, these concepts presuppose not the world of moments, the particular causal power and sensation, but that of continua, the universal causal power and judgement. Therefore, the object of knowledge under consideration should not be understood in its momentary nature but should be grasped as a continuum of moments or an individual. Continuity and identity of the object being thus preserved, we can safely say that the truth of knowledge can be ascertained by our later experience despite the temporal difference of the actual objects. Now, all of this points to the pragmatic and conventional nature of Dharmakīrti's definition of *pramāṇa* or true knowledge.

How truth of knowledge is ascertained is one of the main points of debate in the later Indian theory of truth.[38] Some hold that it is ascertained intrinsicall (*svataḥ*), others that it is ascertained extrinsically (*parataḥ*), and furthermore there is a sort of mixed theory. In this context, Dharmakīrti appears to accep the theory of extrinsic ascertainment of truth, yet it is to be noted that he fails to comment further on this problem (§1.4). His followers seem to hold a mixed theory, according to which sense perception of a familiar object and inferential knowledge are intrinsically true, while sense perception of an unfamiliar object requires some other knowledge to ascertain its truth.[39]

Although truth of knowledge is known through our experience, knowledge itself is known for itself, according to Dharmakīrti (§1.4). This is merely a brief statement of one of his main epistemological convictions, i.e. that all knowledge is self-cognizing (*svasaṁvedana*); yet it seems to suggest that truth, being the essential property of true knowledge, should have been known at the same time as that knowledge was self-cognized. Therefore, it would be better to say that self-cognized truth of knowledge comes to be realized or recognized through our later experience.

There remains one minor question to be answered. Some people may wonder why we argue about the truth of knowledge if it can be ascertained by our experience, i.e. they may consider all philosophical treatises useless (§1.4). To this Dharmakīrti replies that a philosophical treatise is useful

because it aims to dispel people's ignorance about the nature of truth as well as things beyond our experience such as the other world.[40]

(iii) PRAMĀṆA REVEALS A PREVIOUSLY UNKNOWN REAL OBJECT

Next Dharmakīrti tries to characterize *pramāṇa* through its object. Namely, the object of *pramāṇa* or true knowledge should be real as well as something new (§§2–2.1). According to him, people resort to *pramāṇa* when they are looking for the fulfillment of their purpose. Therefore, the object of *pramāṇa* should be a real object which is capable of fulfilling a human purpose. It is a momentary existence in the ultimate analysis; yet, as has been pointed out above, the real and momentary object of sensation is grasped as a continuum or an individual at the level of judgement and ascertainement of truth, so that it can be the object of a practical activity. In short, a particular real object (*svalakṣaṇa*) is the object of both *pramāṇa* and a practical activity induced by *pramāṇa*.[41]

Furthermore, according to Dharmakīrti, the object of *pramāṇa* should be something new. This idea is probably derived from a sort of common sense belief that knowledge is meaningless unless it contains some new information. Thus, memory or recognition and, as we shall see below, perceptual judgement are excluded from the realm of *pramāṇa*. A continuous perception, on the other hand, is regarded as *pramāṇa*, though it appears to take in the same object, since, according to the momentariness theory, what appears to be a continuous perception is in fact a series of moemnts of perceptions which take in a new object with each ensuing moment.[42] The definition of *pramāṇa* so far discussed can be called 'the pragmatic criterion of *pramāṇa*' of Dharmakīrti. Now let us see what types of *pramāṇa* he recognizes.

PERCEPTION (OR SENSATION) AND INFERENCE

It is well-known that Dharmakīrti recognizes only two types of *pramāṇa*, viz. perception (*pratyakṣa*) and inference (*anumāna*).[43] According to him, perception is the initial and direct acquaintance with an object. Supposing that we are in thick darkness, we touch something and have the sensation of, say, hardness even before we judge it to be something hard and identify it as a stone wall. Such immediate sensation prior to linguistic formulation is what Dharmakīrti refers to as 'perception'. It is characterized by him as 'free from conceptual construction' (*kalpanāpoḍha*) and 'non-erroneous' (*abhrānta*).[44] Perception is free from conceptual construction because it is direct and total knowledge of a real object. By such knowledge not only an object itself but all of its minor details and specific properties are supposed to be perceived or sensed. Furthermore, perception is non-erroneous knowledge. Dharmakīrti admits two classes of direct knowledge, viz. erroneous and non-erroneous. He considers that erroneous one can occur if we have some physical defect; for example, the moon may look double to someone suffering from a certain eye disease.[45] Erroneous direct knowledge should not, of course, be regarded as *pramāṇa*. Non-erroneous direct knowledge alone is considered to be perception as *pramāṇa*.

Now let us see how perception fulfills the criterion of *pramāṇa* discussed above. Perception is non-contradictory knowledge, for it can lead to the satisfaction of our expectation. For instance, perception of water can lead us proceed to real water, if, immediately after the perception, we judge that there is water in front of us. It is to be noted here that since perception is free from conceptual construction, it lacks the nature of decision (*niścaya*)[46] and determination (*adhyavasāya*), the driving causes of our practical activity. Hence, perception cannot directly lead to the fulfillment of a human purpose – it does so only indirectly with the help of conceptual knowledge (*vikalpa*). If perception is not followed by conceptual knowledge, there will be a sort of continuous perception until the attention is shifted.[47]

Perception reveals a previously unknown real object, for its object is supposed to be a unique particular (*svalakṣaṇa*) which is both real and new every moment. Thus, we can state that perception as defined by Dharmakīrti fulfills his criterion of *pramāṇa*. In short, perception is non-erroneous, non-conceptual, non-verbal, direct and total knowledge of a real particular object, and it is related to the realm of moments and sensation.

What is opposite to perception is conceptual construction or conceptual knowledge. It is erroneous, conceptual, verbal, indirect and partial knowledge of an object in universal characteristic (*sāmānyalakṣaṇa*), and it belongs, of course, to the realm of continua and judgement. Since conceptual knowledge is regarded as possessing the nature of decision and determination,[48] it invariably leads us to a practical activity.

Like direct knowledge, Dharmakīrti seems to admit two classes of indirect and conceptual knowledge, viz. contradictory (*visaṁvādin*) and non-contradictory. Even when we perceive an object correctly, we may form a wrong judgement if there is some obstructing cause or if there is no condition for decision. For instance, we may misjudge a shell as a silver coin on account of the close resemblance of their features, and we may be under the illusion that things last for a certain period of time because we lack the supernatural power to recognize momentary existence.[49] Such judgements are contradictory in the sense that they lead us to unexpected results.

On the other hand, if there is no obstructing cause and there is a condition for decision, such as repeated experience (*abhyāsa*) of a given object, then we will form a non-contradictory judgement which results in a successful activity. For instance, immediately after perceiving a woman, we normally form the judgement that she is a woman. I would like to call such judgement 'perceptual judgement'. Perceptual judgement differs in accordance with the inclination of the perceiver; a lustful man may consider her an object of his passion, a monk in the midst of meditation may regard her as a mere skelton, and a hungry dog may conceive of her as a nice dinner.[50]

Unlike perception, perceptual judgement[51] is indirect and partial knowledge of an object, for it grasps a particular object through one of its many universal characteristics (*sāmānya-lakṣaṇa*). That is why it is regarded as erroneous. Nonetheless, perceptual judgement is not contradictory because, as mentioned above, it helps perception lead us to the fulfillment of our purpose. However, it is not regarded as *pramāṇa* by Dharmakīrti, for it does not fulfill the second part of his criterion of *pramāṇa*; namely, perceptual judgement does not reveal a previously unknow object (§1.2). The immediate object of conceptual knowledge is a universal, but the ultimate object of it is always a unique particular, as

explained above. Thus perceptual judgement gives no new information about its object since the object has already been grasped by the immediately preceeding perception.

Such perceptual judgement is called 'conventional knowledge' (*sāmvṛta*),[52] perhaps because it deals with such conventional existence (*samvṛtisat*) as 'substance' (*dravya*) like a pot, 'number' (*saṁkhyā*) like one, two, and three, 'motion' (*karman*) like lifting, 'universal' (*sāmānya*) like potness, etc.;[53] in other words, it is knowledge based upon normally accepted linguistic convention (*saṁketa*).[54] Perceptual judgement can be called 'concealing' (*saṁvṛti*)[55] because it conceals the totality of an actual unique object by highlighting one of its universal characteristics. Perceptual judgement can be called 'recollecting decision' (*smārta-niṛcaya*)[56] or simply, 'recollection' (*smṛti*)[57] because, as mentioned above, it grasps what has already been grasped by perception. Apart from provoking a practical activity, another important function of perceptual judgement is to prevent wrong judgement from arising.[58] It must be emphasized again that though it is not *pramāṇa*, perceptual judgement is most valueable from the pragmatic point of view, for perception without it will have no practical significance at all.

Perceptual judgement is not the only type of indirect and conceptual knowledge which is non-contradictory. Dharmakīrti admits at least two other types of non-contradictory indirect knowledge, viz. inference (*anumāna*, or knowledge derived from an inferential mark, *liṅga*) and verbal knowledge (*śābda*, that derived from a verbal expression). He regards inference as *pramāṇa*, unlike perceptual judgement, and considers verbal knowledge a special case of inference.[59]

Let us first examine inference. A unique particular, which is the only reality capable of causal efficiency, gives rise to perception or sensation if it is in a perceptible condition; then perceptual judgement follows it if there is no obstructing cause and if there is a condition for decision. However, not every particular is in a perceptible condition, and even if it is perceptible, there may be some obstructing cause which, by preventing correct perceptual judgement, gives rise to wrong judgement. Inference plays an important role in such a case.

A well-known example of inference in India is: when we see smoke on a faraway mountain, we can infer the existence of a fire there. According to

Dharmakīrti, an actual fire on the mountain is not perceptible (*parokṣa*) but it can be inferred by the following process[60]: (1) a particular fire produces particular smoke, (2) the mountain together with the smoke gives rise to perception of the smoky mountain, (3) perceptual judgement of a mountain in general and that of smoke in general follow that perception, (4) there arises recollection of the invariable relationship (*pratibandhd*) between smoke in general and a fire in general, and (5) finally conceptual knowledge of fire in general appears with reference to that mountain; namely, "there is a fire on the mountain." It is to be noted that though the immediate object of inference is a universal fire, it is essentially related with the real particular fire on the mountain.[61]

The above inferential process would not occur, if there were no wrong judgement or superimposition (*samāropa*) that there was no fire on the smoky mountain. In fact, inference is meant to dispel misjudgement and suspicion[62] just as perceptual judgement is meant to prevent them. For example, the misunderstanding that things last for some time can be removed by the celebrated proof of momentariness.

Like perceptual judgement, inference is conceptual knowledge and does not grasp a real particular object as it really is. It merely understands the object through one of its universal characteristics: we infer the real fire on the mountain through its universal characteristic, i.e. fireness.[63] Therefore, inference is essentially erroneous knowledge (*bhrānta*) unlike perception.[64] Nonetheless, like perceptual judgement, it is not contradictory knowledge (*visamvādin*), for it can lead to the satisfaction of our expectation; e.g. after inferring the fire, we can reach the actual fire if we climb up to the top of the mountain. Since inference is conceptual knowledge, it never lacks the nature of decision and determination which lead us to a practical activity.

Time and again Dharmakīrti discusses why inference, though essentially erronueous, can be *pramāna* or non-contradictory knowledge.[65] His reasoning is as follows: Inference does not deceive us but it leads to the fulfillment of our purpose (*arthakriyā*), for it is indirectly but invariably derived from the real object. Inferential knowledge of a fire in general is indirectly related to the real fire on the mountain because it is derived by the above-discussed process, and it is invariably related to the real fire because the smoke on the mountain, which is the object of the perception initiating the inferential process, is actually produced by that fire.

Dharmakīrti proposes two types of invariable relationships which enable inference, viz. causal relationship (*tadutpatti*, e.g. between a fire and smoke) and integral relationship or essential identity (*tādātmya*, e.g. between the nature of a tree and that of a Śiṃśapā tree).[66] As a matter of fact, the question of how conceptual knowledge like inference is related to reality constitutes one of the chief philosophical interests of Dharmakīrti. He explains it away by the Apoha theory that can be applied to various problems related to conceptual knowledge such as the object and the function of conceptual knowledge, the nature of universal, and the meaning of a word. Though of great importance and interest, a full discussion of the Apoha theory lies beyond the scope of this article.[67] In any case, inference can be regarded as non-contradictory because it is firmly rooted in reality.

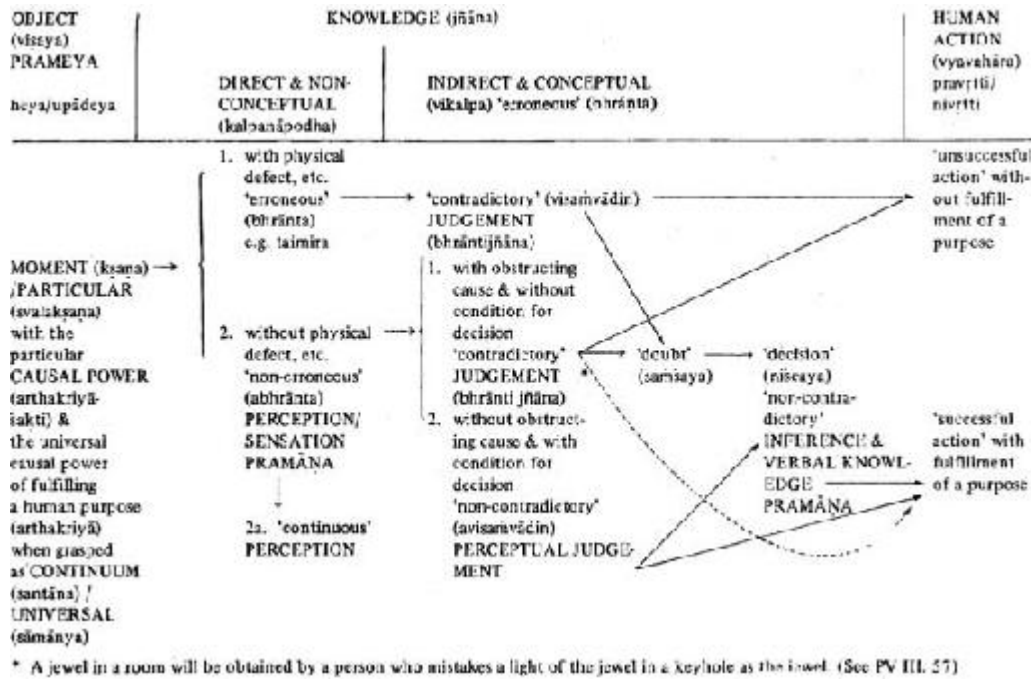
So far there has appeared to be little difference between perceptual judgement and inference, but they differ significantly with regard to the problem of whether or not they reveal a new fact. To reiterate, perceptual judgement does not give new information; inference, however, can reveal a previously unknown real object, because the actual fire on the mountain is not directly perceived by one who relies on inference.[68] Thus, we can state that, unlike perceptual judgement, inference as defined by Dharmakīrti fulfills his criterion of *pramāṇa*.

Verbal knowledge is regarded by Dharmakīrti as a kind of inference. According to him, the hearer of a verbal expression infers what is intended by the speaker who utters it. He seems to presuppose the following process of verbal knowledge: When someone utters a word, say 'cow', he has a certain idea of cow in general in his conceptual knowledge. To one who hears the word 'cow', there occurs knowledge in which an idea of cow in general appears on account of his previous experience of verbal expression as well as impression (*vāsartā*) of linguistic convention.[69]

Like inference proper, verbal knowledge is non-contradictory in the sense that it can correctly indicate the intention of the speaker, or more precisely, that it can indicate what appears in the conceptual knowledge of the speaker when he utters a word (§1.1). Since the speaker's intention is not directly accessible to anybody but the speaker himself, it cannot be perceived by the hearer; hence, it can be said that verbal knowledge reveals a new fact as long as it indicates the speaker's intention correctly. Thus, verbal knowledge too fulfills Dharmakīrti's criterion of *pramāṇa*. There is, however, one important difference between inference proper and verbal knowledge;

namely, while the former is indirectly but invariably related with reality, as discussed above, the latter has no basis in reality (§1.1) because verbal knowledge is based wholly upon linguistic convention.

We have so far seen how perception and inference fulfill Dharmakīrti's criterion of *pramāṇa*: Non-contradictory knowledge which reveals a previously unknown real object. According to this 'pragmatic' criterion, both perception and inference are regarded as *pramāṇa* or true knowledge. However, it should be remembered that Dharmakīrti characterizes perception as 'non-erroneous' and inference as 'erroneous'. This clearly indicates that he holds another criterion of true knowledge and truth apart from the pragmatic one.

Dharmakīrti defines error (*bhrānti*) as 'that which grasps *x* as non-*x*' – the time-honored definition of error in India.[70] This implies that non-erroneous knowledge is that which grasps a real object as it really is. As mentioned above, one of the fundamental presuppositions of Dharmakīrti's epistemology is that the object is capable of projecting its image into the resultant perception and, hence, perception resembles its object. Thus, it is clear that Dharmakīrti believes in some kind of real 'correspondence' between perception and its object, namely, resemblance of the image.[71] In other words, he holds that perception possesses the true representation of its object. That is why perception is regarded as non-erroneous.


We have seen above that, according to Dharmakīrti, not only inference but also conceptual knowledge in general merely grasp one universal aspect or characteristic of the real object. In other words, inference takes a universal as its immediate object and possesses a partial and generalized picture of the object rather than the true representation of it. There is no real correspondence between inference and its real object, but merely an indirect causal relationship. In short, inference grasps the object through its universal characteristic. Therefore, Dharmakīrti considers inference to be erroneous. As a matter of fact, he even seems to suggest that within the entire process of inference described above only the initial perception of an inferential mark (*liṅga*) on the locus of inference (*anumeya*) is *pramāṇa*, because the rest of knowledge which contributes to inference is nothing but conceptual knowledge.[72]

Thus, we can say, from a purely epistemological point of view (not from the pragmatic one), that perception alone is regarded as true knowledge, while inference and other conceptual knowledge are erroneous.

CONCLUSION

Dharmakīrti holds two distinct criteria of true knowledge or truth. Namely, (1) from a pragmatic point of view and in the realm of continua, universals, universal causal powers and judgement, both perception (or sensation) and inference (including verbal knowledge) are non-contradictory and true in the sense that they can lead to the fulfillment of a human purpose and give new information about the object. (2) From a purely epistemological point of view and in the realm of moments, particulars, particular causal powers and sensation, only perception is non-erroneous and true in the sense that it alone possesses the true representation of its object. Inference is not true according to the epistemological criterion of truth, but it may be considered to be truer or at least more valuable than perception according to the pragmatic criterion of truth. For perception, devoid of the nature of decesion and determination, requires perceptual judgement in order to attain the fulfillment of a human purpose, while inference is of the nature of decision and determination and does not require any such knowledge. Finally, it is to be noted that perceptual judgement plays an indispensable role in both perception and inference, though it is not regarded as *pramāṇa* or true knowledge by Dharmakīrti.

Hiroshima University

OBJECT (viṣaya) PRAMEYA · heya/upādeya | KNOWLEDGE (jñāna) | HUMAN ACTION (vyavahāra) pravṛtti/nivṛtti

KNOWLEDGE (jñāna):
DIRECT & NON-CONCEPTUAL (kalpanāpodha) — INDIRECT & CONCEPTUAL (vikalpa) 'erroneous' (bhrānta)

MOMENT (kṣaṇa) → /PARTICULAR (svalakṣaṇa) with the particular CAUSAL POWER (arthakriyā-śakti) & the universal causal power of fulfilling a human purpose (arthakriyā) when grasped as CONTINUUM (santāna) / UNIVERSAL (sāmānya)

1. with physical defect, etc. 'erroneous' (bhrānta) e.g. taimira → 'contradictory' (visaṁvādin) JUDGEMENT (bhrāntijñāna) → 'unsuccessful action' without fulfillment of a purpose

2. without physical defect, etc. 'non-erroneous' (abhrānta) PERCEPTION/SENSATION PRAMĀNA →
   1. with obstructing cause & without condition for decision 'contradictory' JUDGEMENT (bhrānti jñāna)
   2. without obstructing cause & with condition for decision 'non-contradictory' (avisaṁvādin) PERCEPTUAL JUDGEMENT

2a. 'continuous' PERCEPTION

'doubt' (saṁśaya) → 'decision' (niścaya) 'non-contradictory' INFERENCE & VERBAL KNOWLEDGE PRAMĀNA → 'successful action' with fulfillment of a purpose

DOES INDIAN EPISTEMOLOGY CONCERN JUSTIFIED TRUE BELIEF?*

Of the various topics which are taken up in classical Indian philosophy, *prāmāṇyavāda*, equated with epistemology in the critical literature, strikes the Western philosopher of today as being most akin to something of deep concern to him. On the basis of the translations of the Sanskrit literature provided in the best contemporary expositions of Indian thought, questions about the nature of knowledge and truth appear to be clearly broached in Indian texts, and the intricacies of some of the analyses to be found in those texts rival the intricacies of analysis as practiced by the best of recent and living Anglo-American professional philosophers.

In my opinion the most outstanding exposition of Indian thinking on the topic of *prāmāṇyavāda* is to be found in the work of Jitendranath Mohanty, and most notably in his ground-breaking book, *Gaṅgeīsa's Theory of Truth*.[1] In his Introduction to a translation of the *(Jñapti) Prāmāṇya* section of Gaṅgeśa's *Tattvacintāmaṇi* Mohanty first disambiguates a number of key terms and lays out in exemplary fashion the issues which appear to separate the two sides in the classical polemic concerning whether the awareness of *prāmāṇya* is "intrinsic" (*svataḥ*) or "extrinsic" (*parataḥ*). This review distinguishes the positions not only of the many important Indian systems involved – Mīṃārṇsā, Advaita and Nyāya – but also succinctly identifies the positions of subschools within these as well as the opinions of individual philosophers found in their writings. This Introduction is followed by a faithful translation of Gaṅgeśa's chapter with copious explanatory remarks without which the *Tattvacintāmaṇi*, extremely laconic in its style, could not be understood by anyone not initiated into Sanskrit and Navyanyāya. The entire volume is a tour de force, a subtle, critical

illumination of the most intricate kind of materiāls calling for that rare combination, brilliance as Indologist and philosopher rolled into one.

Though the paper that now follows takes issue with some of Mohanty's conclusions, this in no way should be thought to mitigate against what I have just said about the book. It is only because of rare efforts such as his that it becomes possible to push further into important matters and argue issues in a fashion that promises to provide general insights.

Mohanty's conclusion to his Introduction is that both the *svataḥ* and *parataḥ* theories about awareness of *prāmāṇya* are "valid in their own ways"[2] because two critical terms, "jñāna" and "prāmāṇya", have different meanings for the proponents of the two competing views. Translating "jñāna" as "knowledge", Mohanty writes

"The *svataḥ* theory understands 'knowledge' in a strict sense such that the theory becomes an analytic consequences of its conception of knowledge",

whereas

"the *parataḥ* theory takes "knowledge" in a rather weak sense so as to include within its scope both true knowledge and false knowledge."[3]

As for "prāmāṇya", translated as "truth", Mohanty distinguishes some three different senses of this term that are held by one or another of the *svataḥ* proponents, and says that "The Naiyāyikas mean something else by truth",[4] since the *parataḥ* view is referring to the truth of a belief, whereas the *svataḥ* theorists are talking of the truth of knowledge. The former allows of an opposite; the latter does not. Thus

"the two points of view do not necessarily clash but may be brought into a happy reconciliation",[5]
"both the theories are thus in their own ways correct."[6]

The conclusion Mohanty arrives at is that the *svataḥ* vs. *parataḥ prāmāṇya* controversy is another illustration of what I have called[7] the "incommensura-bility thesis", to the effect that no real substantive issue has been joined since, though the two parties think they are talking about the same thing, they aren't. An issue taken by classical Indian philosophers over many centuries to involve a fundamental clash of views turns out to be merely verbal. As a result, Mohanty adds, some things the tradition says, e.g. about the related question of the origins of truth, turn out to be things

they shouldn't have said; because of verbal confusion, they should have said something else.[8]

Now there are, I realize, those who find the incommensurability thesis inherently attractive, promising eventual sweetness and light free from controversy. I am not one of those. It seems to me that Mohanty's conclusion downgrades the importance of epistemological discussions in Indian philosophy. Thus, to take a pertinent example out of Mohanty's own material, Gaṅgeśa's attempt (beautifully explained by Mohanty) to find a formulation common to all the proponents of *svataḥprāmāṇya* so that Nyāya arguments against that thesis will apply to all versions of the thesis at once, turns out to be a kind of pointless effort, since if the incommensurability thesis is true the Nyāya arguments miss the opposition completely. More generally, one would suppose that the many generations of thinkers as subtle and profound as those responsible for the polemics in question would have been clever enough to recognize that the issue they were expending so much energy on was a verbal one. I think the issue was not a verbal one, that it represented a real and important confrontation of opinions. Furthermore, to see what the issue is cannot help but illuminate wider issues of comparative study, since Indian epistemology features a conception of knowledge which is nonequivocally shared by all its schools but nevertheless contrasts with the currently favored conception of knowledge in Western philosophical analysis. Since all is not well with the current conception of knowledge in Western philosophical analysis, it would seem that any epistemologist should be interested in exploring the matter.

Specifically, Mohanty takes as a "phenomenological description" of knowledge the account of it, widely held in contemporary analytic philosophy, as justified true belief.[9] My argument in this paper is that Mohanty's conclusion (reported above) is conditioned by his acceptance of the justified true belief account of knowledge, but that such an account is foreign to Indian thought, so that Mohanty's conclusion distorts the situation and leads to the unwelcome claim of incommensurability. Having argued for these points I shall go on to speculate whether the Indian conception of knowledge can be analyzed at all, if so, how, and whether any Western notions are illuminated by such analysis.

Mohanty chooses to translate the Sanskrit term "jñāna" as "knowledge", following others. He does this despite his own admission that such a

translation is "definitely misleading"[10] and in fact incorrect. Having admitted that, he then "proposes" to use the English word "knowledge" in the way the Nyāya uses "jñāna".[11] He notes, however, that the word "pramā" translates as "knowledge",[12] and he himself uses "knowledge" regularly to render "pramā". Thus he has the same English word rendering two distinct Sanskrit expressions, expressions which on his own showing connote distinct senses. Since this evidently invites confusion, I prefer to provide my own exposition of the two notions, leaving the Sanskrit terms untranslated until I have argued the case for the proper translations.

A *jñāna* is, in the relevant sense for us,[13] an act[14] of awareness. It does not name a disposition (say, to respond in a certain way when meeting a certain sort of thing). A *jñāna* is something which happens at a time, an occurrent. If it involves belief, it does so only in the sense of a believing as a fleeting act of awareness. A *jñāna* is not a belief in the dispositional sense. And not all *jñānas* are beliefs even in the occurrent sense – believing is, or may be, only one sort of *jñāna*. Any act of awareness which has intentionality constitutes a *jñāna*. Entertaining a doubt, vaguely sensing the presence of something or other, drawing a reductio ad absurdum inference, and understanding someone's meaning are all *jñāna*. None of them are believings. And since they are not beliefs (in any sense) none of them are true beliefs, and none of them are justified true beliefs. Rather, a *jñāna* is, as indicated, *an* awareness. It is not knowledge, or even *a* knowledge *per se*, though it remains open to further scrutiny whether all, some or no acts of awareness constitute instances of knowledge in some sense other than justified true belief.

A *pramā* is an awareness which has a certain essential property, called *prāmāṇya*. Mohanty renders "prāmāṇya" as "truth" and argues that there are "different types of concepts of truth to be met with in the different versions of the *svataḥ* theory."[15] But I do not find that he demonstrates this claim. He has not shown that the several versions of the *svataḥ* theory represent different meanings of "prāmāṇya". They may be different theories about how we become aware that something answers to a single concept. Indeed, Gaṇgeśa clearly assumes the latter to be the case. Othenvise he would hardly have proposed his account of what the several versions of the *svataḥ* theory have in common with his own, i.e., what *prāmāṇya* is.

Gaṅgeśa approach is to set forth a univocal account of what the opposition's thesis is to collect the best arguments for that thesis, to refute those arguments, and then to offer arguments in favor of the opposite thesis his own. Gaṅgeśa appears to believe that he and his opponents are debating a thesis whose formulation is in terms of concepts they both understand and share. Before we settle for the incommensurability solution proposed by Mohanty, I suggest we should examine the notion of *prāmāṇya* to see if we cannot, using Gaṅgeśa's suggestions as a guide, find a meaning for the term which will make the debate a real rather than a sham confrontation.

First, some formal features of a *pramā*. As we have seen, a *pramā* is an awareness. Thus, it is an occurrent, not a clisposition. So, if we do choose to translate "pramā" as "knowledge" we must immediately recognize that it is not knowledge in the sense of justified true belief, where "belief" means the disposition to respond in appropriate ways when stimulated.

Nevertheless, if we consider the notion of an occurrent believing I think there is reason to think that a *pramā* can be considered to be such. There is Sanskrit terminology to the point. A *pramā* is a type of awareness which has the property of being an ascertaining (*niīcaya*), as opposed to another type of awareness, doubting *(samīaya)*. *Pramā* is not the only such type of awareness: a *viparyaya*, erroneous or false awareness (*mithyājñāna*), is also a *niīcaya*. In the case of both *pramā* and *viparyaya* one has an awareness that is not accompanied by a feeling of doubt or puzzlement, one is not vacillating among more than one alternative hypothesis, but "declaring" for one thesis among alternatives, although he may not express it verbally and is not neces-sarily conscious of his nonvacillation. So perhaps a *pramā* is a belief after all, though in the occurrent rather than the dispositional sense. And if it should turn out that it must be true ās well, then it may be thought that *pramā* is not so far removed from justified true belief after all. Unfortunately, as we shall see, it is not at all clear that a *pramā* must be true in the sense that the justified true belief account of knowledge wants it to be.

Every *pramā* is intentional. It has a content (*yiṣaya*), as every awareness has. To decide whether truth is a necessary condition for an awareness to be a *pramā* one must carefully assess the relation which a *pramā* must bear to its content. We want a relation, R, which holds between any *pramā* and its content, a relation which can be admitted by every Indian philos-opher to hold between a *pramā* and its content regardless of the particular theory he

or any other Indian philosopher proposes about the nature of or proper analysis of R. That is, we want an account of R, and thus an account of the meaning of "prāmāṇya", which will accommodate what Gaṅgeśa says his opponents propound as well as what he, Gaṅgeśa, pro-pounds. Hopefully, to go a little farther, it will accommodate what all Indian systems which have been involved in the controversy over *svataḥ* vs. *parataḥ prāmāṇya* can agree on as a meaning for "prāmāṇya". Thus the account of R must not beg issues between, e.g., "idealist" systems like Buddhism or (perhaps) Advaita and "realist" ones such as Nyāya and Mīmārṇsā. The incommensurability thesis contends such an account cannot be found. Let us see if we can't find one.

My suggestion about what R is, is this: where "J" stands for a *jñāna*, and "C" stands for its content,

> R_J iff J apprehends (1it. "measures out") C in accordance with the purpose that motivated J.

This suggestion arises from a combination of considerations. The verb complex *pra + mā* literally means to measure something out, by which I take it is meant to cognize something in a certain way, a way that involves at least a minimal structure. Another consideration is that when one seeks to find a Sanskrit term by which R is glossed one regularly finds "yathārtha". This compound has regularly been translated as "as the object is" or something to that effect, a translation that seems to bolster the interpretation of *pramā* as requiring correspondence of J's structure with the structure of some object already there independently of the cognizer. But it needn't be understood that way. The compound can quite as easily mean "as the purpose is", for "artha" frequently has the sense of "purpose", as in the phrase "purusārtha", meaning human aims or purposes.

My suggestion, then, is that with R, so defined, as the relation between a *pramā* and its content, we can make sense of Gaṅgeśa's chaim that the analysis he proposed provides a univocal meaning for "prāmāṇya", thus providing a ground for a confrontation between *svataḥprāmāṇya* and *parataḥprāmāṇya*. Next, I want to examine whether this suggestion can be supported from the literature.

Gaṅgeśa's analysis runs as follows:

"*Prāmāṇya* is either (*x*) being an awareness whose chief qualifier, *x*, is in what possesses *x*, or (b) being an awareness of a relatedness of *x* to what possesses *x*."[16]

This is to say that a *pramā* is an awareness (a) whose predicate term (as we might put it) belongs to its subject term, or (b) which attributes some property, *x*, to its content which has *x*. Gaṅgeśa argues, in favor of his analysis, that only when (a) or (b) is satisfied does one undertake action predicated on the awareness in question. In addition, he argues, this is the most eco-nomical account of what *prāmāṇya* is.[17]

It is important to emphasize that Gaṅgeśa pūts forth this analysis as a conception which is common to all of the theories about *prāmāṇya*. As Mohanty explains, Gaṅgeśa's idea is that, however each different *svataḥ* theorist thinks the *prāmāṇya* of an awareness J_1 is made known to us, in any case *what* is made known is a combination of two things, (1) that the qualificandum (i.e., the subject term) of J_1 possesses a certain property, and (2) that that property is the chief qualifier (predicate term) of Jj. The claim is that the joint satisfaction of (1) and (2) is a requirement common to all those who hold to *svataḥprāmāṇya*, and that it is likewise a necessary condi-tion (though possibly not a sufflcient one) even according to *pratahprāmāṇya* that (1) and (2) be satisfied whenever *prāmāṇya* is present.

Among those philosophers who have become caught up in the *svataḥ/parataḥprāmāṇya* debate we may count some Buddhists, several kinds of Mīmāmsakas, the Naiyāyikas and not a few Advaita Vedāntins. My discussion will be content with these, though there may be others as well. What I am about to argue, then, is that, for each of half a dozen distinct formulations by Indian philosophers of what "prāmāṇva" means, each of them satisfies (1) and (2) and also provides an instantiation of what I have proposed to be the relation R. If that is correct, it suggests that Gaṅgeśa's thesis about *prāmāṇya* being a univocal notion holds good, at least provided the relation R is understood my way. Then I shall show that, understood the way Mohanty understands R, the *svataḥ* theory indeed becomes trivialized. But, as I see it, that is a reason to prefer my understanding of R, not his.

Let me start with Buddhism (although Mohanty's discussion leaves the Buddhists aside, no doubt because Gaṅgeśa's discussion does not involve them). In Dharmottara's *Nyāyabindutīkā* we flnd the following passage explicating the notion of "right awareness" (*samyagjñāna*, which I take to be his term for *pramā)*,

"Right awareness is awareness that is not contrary to what it is right to attribute (to something) (*avisamvādaka*). In ordinary usage it is said that what is right to attribute (to something) (*sarṇvādaka*) is that which causes us to attain a purpose (or a thing, *artha)* which has been previously

identified…. 'Attaining the purpose' nere means just causing our activity to have to do wkh the purpose (or thing, *artha*) identified, and nothing else. Now, awareness does not produce the purpose, but it does cause us to attain it. In causing a person to initiate activity toward a purpose, it causes him to attain it. This initiating of activity is merely the identification of a content of activitv…".[18]

As I read this passage, Dharmottara's idea is that the function of a right awareness is to direct the attention of the person having it toward the content of that awareness as being relevant to a previously identified purpose or purposive object. That sort of awareness which does this regularly deserves to be called a *pramāṇa*. What sort of awareness does this regularly? According to Buddhism of Dharmottara's school it is perceptual awareness, defined as direct awareness, i.e., awareness which does not involve conceptual construction(*kalpanāpodha*).[19] What we might call sensation constitutes such perception, since it is a moment of sensorv awareness prior to association with language or memorv. Sensation is right awareness par excellence for the Buddhist, since its entire function consists in calling its content to our attention as something which is a possible object of successful purposive activitv.

For Dharmottara, then, the relation R (between right awareness and its content) requires that the awareness apprehends the content as an objective suitable for successful purposive activitv. This is an instance of my relation R. And if (as Gaṅgeśa himself will not admit) sensation can be supposed to ascribe a propertv *x* to something, then a right awareness ascribes to its content the propertv of being an objective of successful activitv, which propertv that content (which Buddhism calls the *svalakṣaṇa)* indeed possesses.

Next Iet us consider those schools which are treated by Gaṅgeśa himself. First we may consider the Prābhākara Mīmārṇsaka. Mohanty succinctly expresses the Prābhākara notion of *prāmāṇya* when he points out that according to the Prābhākara "there is no cognitive error"; rather, he writes,

"when we say a knowledge" (i.e., an awareness – my interpolation) "is false we really mean – the Prābhākara seems to be saying – that it leads to unsuccessful behaviour."[20]

A few lines later, Mohanty indicates that a rather late Prābhākara, Rāmānujācārya, distinguishes between three relations, *viz., yāthārthya, prāmāṇya* and *sarṇyaktva*.

"*Yāthārthya* belongs to all awareness (including memory and what ordinarily passes for erroneous apprehension), *prāmāṇya* to all awareness excepting memory (but including even the so-called

erroneous apprehension) and *saṃyaktva* only to such knowledge other than memory which leads to successful practice."[21]

"Saṃvak" is the same term we translated as "right" in the Buddhist context of "right awareness". The Prābhākara view thus approximates to that of the Buddhist, with some added distinctions which do not affect my point. That point is, once again, that both my analysis of R and Gaṅgeśa's characterisation *ofprāmāṇya* are satisfied on the Prābhākara account. As in Buddhism, the function of a *pramā* is to present to us a content which may be an objective of successful activity – the Prābhākara adds that it must do so for the first time, that it not be a remembrance, but that does not materially affect the point being argued.

   Turning next to the Bhāṭṭa Mīmāṃsakas, followers of Kumārila, and once again considering Mohanty's excellent review of their views,[22] we find a divergence of explanations but essential agreement that either *prāmāṇya* involves the relation that we have seen Buddhists and Prābhākaras to emphasize, viz., the picking out of a content as an objective of successful activity, or else (for some Bhāṭṭas) it involves a relation they term "viṣayatathātva", which might be rendred as "(Js) being as its content is". I submit that this relation can well be taken as equivalent to my R, e.g. as a pragmatic verification relation, and that it also nicely satisfies Gaṅgesa's analysis of *prāmāṇya*.

   A third type of Mīmāmsā is that known as the Miśra school, a system whose literature is largely lost to us but which appears in an important role in Gaṅgeśa's discussions. The Miśra account of *prāmāṇya* is rather more complex than those of the other Mīmāmsakas. The Miśra analysis is that *prāmāṇya* is "tadvadviśesyakatve sāti tatprakārakatva",[23] that is to say, a *pramā* must satisfy two tests, (1) that the J in question must present a qualificand, C, which has a chief qualifier, Q, and (2) that it must present C as qualified by Q. When we compare this with Gaṅgeśa's analysis we find that (1) and (2) are precisely (1) and (2) of Gaṅgeśa's analysis. And since the *pramā* J apprehends C as qualified by Q in accordance with the purpose which informs J (whatever purpose that may be) the Miśra analysis also fits the requirements of my R.

   Next, consider the Vivaraṇa Advaita Vedānta school's analysisof *prāmāṇya* as "arthaparicchedasāmarthya",[24] i.e., as the property of being an awareness which is capable of picking out (that content which accords with)

its purpose.[25] It should be clear that this conception once again satisfies both my account of R and Gaṅgeśa's analysis of *prāmāṇya*.

Finally, we must consider the Nyāya analysis itself, which is just that which Gaṅgeśa himself proposed, viz., the simultaneous satisfaction of (1) and (2), "tadvati tatprakārakatva".[26] *A fortiori*, this satisfies (since it is identical with) Gaṅgeśa's analysis of *prāmāṇya*. Does it fit my analysis of R? Yes, certainly if the purpose motivating the awareness is to apprehend its content in such a way as to correspond with some assumed external object with a fixed, independent structure, which is what scholars have usually supposed Nyāya thinks the purpose of *pramā* to be.

Mohanty is puzzled by the fact that Madhusūdana Sarasvatī, a famous Advaita Vedāntin, also adopts the very same terminology in his analysis of *prāmāṇya* as does Gaṅgeśa.[27] The reason he is puzzled is that Nyāya and Advaita differs so widely in epistemology, the former carefully distinguishing what is externally and independently real from what is internai, mental and perhaps unreal, the latter blithely uninterested in such a contrast. Mad-husūdana views *tadvati tatprakārakatva* as "belonging to all apprehensions, not excluding error,"[28] writes Mohanty, whereas Nyāya thinks it picks true apprehensions out from false ones. But all of this underlines what I am driving at, which is that "prāmāṇya" does not translate as "truth" (i.e., correspondence with reality), despite Standard translation practice, but rather connotes a more pragmatic criterion of being capable of producing or helping to produce satisfaction in action.

So, *prāmāṇya* is not belief (at least as disposition), and for Indian philosophy in general it isn't truth (as correspondence with a fixed antecedent nature of an independently real object). But the justified true belief account of knowledge assumes that knowledge is just belief which corresponds to reality. For that reason, if "knowledge" suggests, as I think it tends to, justified true belief to English readers it should be eschewed as a translation of "pramā".

To put it another way, on the analysis which Gaṅgeśa offers of *prāmāṇya*, understood in the terms suggested by my analysis of relation R, a *pramā* may not correspond with the nature of things (it is "compatible with error", as Mohanty expresses it). Whether or not *prāmāṇya* is confined in its application to awarenesses which attribute to their content properties which an object corresponding to that content actually has is not a matter of the deflnition of "prāmāṇya" (as it *is* taken to be a matter of the deflnition of

"truth" in Western contemporary thought), but constitutes rather further theory about *which* awarenesses satisfy the purposes motivating them. Naiyāyikas think that further theory which requires correspondence is the correct one; other systems, such as Buddhism and Advaita, do not.

Mohanty finds that the *svataḥ* and *parataḥ* theorists do not confront each other because they have different meanings v of *prāmāṇya* in mind. The issue between the two views is presented in the literature to be as follows, according to Mohanty. The *svataḥ* theorist holds that whatever awareness first makes us aware of some awareness J_1 (whether that be J_1 itself, some inference, or a subsequent "aftercognition"), that awareness makes us aware that *Ji* has *prāmāṇya*. The *parataḥ* theory denies this claim. Now Mohanty, interpreting "prāmāṇva" as "truth" and "jñāna" as "knowledge", arguesthat "the (consequence of its conception of knowledge".[29] Since the *svataḥ* theory is therefore true (necessarily, though trivially, so) Mohanty reasonably enough concludes that the *paratah* denial of it can only be saved from absurdity if we suppose that the *parataḥ* theorists mean something else by "jñāna".

But, as we have seen, "jñāna" doesn't mean "knowledge" at all, but awareness. So one might conclude that Mohanty has been led astray by a mistranslation. However, it's not that simple. For even when we agree to translate "jñāna" as "awareness", while retaining "truth" for "prāmāṇya", the *svataḥ* theory stili appears to be either trivial or else so absurd that we must conclude that we haven't understood it at all. For consider: the *svataḥ* theory is the theory that, for any awareness J_1, whatever awareness first makes us aware of J_1 makes us aware that J_1 is true. But if "truth" means correspondence with reality then either all awarenesses are true (and there can be no error at all) or else we aren't talking about becoming aware that J_1 *is* true, but merely about coming to *think* that J_1 is true. But that is absurd – if I entertain a false awareness J_1 and (then) come to an awareness of J_1, then on that reading of the *svataḥ* position I could not thereby think that J_1 is false; indeed, I could not at that time even doubt whether J_1 might be false. But we do have such doubts. So either the *svataḥ* theory is a trivial one (since all awarenesses are ipso facto true), or it is so absurd as to constitute its own refutation. Seeing this, one can understand why Mohanty finds an equivocation on "truth" to be the only way to explain how an issue of any consequence was imagined by anyone to have been raised.

Now I am arguing there is a nontrivialized and far from absurd issue which the *svataḥ/parataḥ* debate is about. What is that issue? I take it it is this. The *svataḥ* theorist holds that, whatever causes us to be aware of J_1 causes us to be aware that Ji can satisfy its purpose, i.e., can lead to successful activity of the relevant sort. The *parataḥ* theorist denies this, holding that in order to become aware that J_1 can satisfy its purpose we need a further awareness, presumably inferential, which is over and beyond the awareness which causes us to be aware of Ji itself. The point comes out most dramatically when we contrast the Miśra theory with the Naiyāyika's. On both theories we first have an awareness, J_1, which is not self-aware but for the awareness of which we require an "aftercognition" J_2. The Miśra theory holds that J_2 not only makes us aware of Ji but also of J_1 's *prāmāṇya*, i.e., J_1's capacity to evoke successful activity. The Nyāya theory denies that J_2 makes us aware of J_1's *prāmāṇya*. It holds that only an inference, e.g., one based on successful action or reasons to think that such activity would be successful, can attest to J_1's *prāmāṇya*.[30]

Notice that it doesn't matter to the *prāmāṇya* debate so posed whether J_1 is true or false, or thought to be true or false. Whether a theorist holds that all awarenesses are true, or all are false, or that some are and some not, the *prāmāṇya* issue remains a real one. Nor does it matter whether a theorist thinks that only true awarenesses can lead to successful activity or, alternatively, thinks that some awarenesses capable of leading to successful activity can be false. The issue concerns whether, when one becomes aware that J_1 is a potential purpose-satisfier, he does so through the same awareness by which he became aware of J_1's occurrence, or through some *other* awareness.

Gaṅgeśa's main argument against the *svataḥ* theorist is that if the *svataḥ* theory were correct it would make it impossible for one to doubt J_2's *prāmāṇya* immediately after J_1's occurrence. That is, since the *svataḥ* theory says that the awareness by which we first become aware that J_1 occurred always involves an awareness that J_1 can satisfy its purpose, has *prāmāṇya*, this blocks our doubting at that moment that it has *prāmāṇya* – but we *do* in fact sometimes doubt the worth of a J as soon as we become aware that it has occurred. Now Gaṅgeśa, no doubt, as a Naiyāyika believes

that only true Js can satisfy their purposes, so *his* point can be stated as Mohanty renders it, in terms of 'truth' instead of satisfaction of purpose. But the argument is supposed to tell against an opponent who does not share Gaṅgeśa's belief on that score; the argument's force is a general one not dependent on any particular account of the circumstances that make J a *pramā*.

How then can we translated "prāmāṇya", given that "truth" is misleading as such a translation? We are by now reminded of the writings of the pragmatists, notably William James in his jousts with the notion of truth, which I suspect led him to a position closely resembling that of Indian epistemology. James conceived of truth as "what works", though he was sometimes (not always) cagy about what "working" amounted to and failed to appreciate the difference between his account of truth and the correspondence account with which his view was at odds. We might borrow his term and translate "prāmāṇya" as "workability". A workable awareness *(pramā)*, then, is one that is related to its content by R, i.e., apprehends its content in a manner leading to the satisfaction of the purpose motivating it.[31] Then, the argument to this point might be summed up in the following way: all the parties in the *svataḥ/parataḥ* debate agree that the debate is about workable awarenesses.

It is irrelevant to this debate whether an awareness is held to be workable if and only if it is true. Some (the Nyāya) say so, others (Advaitins, Buddhists) deny it. The opposite of "workable" is not "false" but "not workable" (*apramā*), which term is intended to characterize all kinds of awarenesses which cannot lead to the satisfaction of a motivating purpose. The term *apramā* ranges, as we saw, over doubtings, errors and reductio ad absurdum arguments. When one is in doubt, he is not satisfying a purpose (doubting is not a purpose). Errors (i.e., perceptual errors, like the mirage) frustrate our purposes by misleading us. Finally, in a reductio argument the purpose is to prove one's own position (so we're told) but what the reductio *(tarka)* does is merely to convict the opponent of a fault, which does not (at least by itself) effect any proof (unlike a proper inference, where the conclusion does indeed prove just what was intended to be proved).

It is suggestive, furthermore, that proving what is already accepted *(siddha-sādhanatā)* is counted as a fallacy (and so as *apramā*, nonworkable) even though what it says is true.

The standard Western reply to the kind of position that emerges from this analysis of Indian epistemology will surely echo the usual response to a reading of James on truth: that the pragmatist or "workability" conception conflates truth with what has value. Recent philosophical analysis has adopted, with a severity bordering on the obsessive, noncognitivism or nonnaturalism in value theory. What used to be known as the "fact-value gap" is nowadays such a chasm that it is hard to convince anyone that there is one. It should be no surprise that classical Indian thought takes the naturalistic position on values; after all. so did Western thought in classical times and until a couple of centuries ago. Justified true belief, as an analysis of knowledge, is understood strictly along noncognitivist lines. A belief, in the sense understood there, must be something capable of being evidenced, and the evidence must be empirical, perhaps mathematical, but clearly not ethically or aesthetically normative. (Of course, one can have justified true belief *about* what norms are in force; for that one can produce nonnormative evidence. What one can't have is a justified true belief that *x* should be done, thought, etc.) The "true" in justified true belief is descriptive truth, possibly fudged to encompass "descriptions" of mathematical or logical "facts" (though these are actually linguistic facts, if facts at all, and normative otherwise).

I cannot undertake at this point in this paper to investigate the sources of the noncognitivist obsession. But insofar as the motivation for maintaining it may be supposed to mutually support any attractiveness which the justified true belief account of knowledge might be supposed to have, I shall conclude with some observations which seem to me to suggest that all is not well with the JTB account (as I shall call it hencefonvard).

It is sometimes suggested that the JTB account is embedded in ordinary language (ordinary English, that is). "There is a certain absurdity", writes Mohanty,

"in saying both 'I know that S is p' and 'S is p is false'. One cannot know and yet be in error with regard to what he knows. If something is known, it follows necessarily that it is true."[32]

But, as Austin has argued, that may be because of what it is to *say* "I know", involving conversational implicatures or performatives. We should not draw a conclusion about the nature of something from the circumstances involved in certain special kinds of locutions involving terms for it. And furthermore, Austin argues,

"We are often right to say we *know* even in cases where we turn out subsequently to have been mistaken – and indeed we seem always, or practicatty always, liable to be mistaken."[33]

The JTB account is far more rigorous than the subtle possibilities of ordinary language can support.

Again, a growing number of contemporary philosophers have seriously questioned whether in ordinary usage knowledge entails belief, as the JTB theory entails it must. Zeno Vendler has argued that "I believe that p", far from being required by "I know that p", is incompatible with it, since in the relevant contexts to say that one believes is precisely to indicate that one *doesn't* know.[34]

These worries address the question of whether "knowledge" actually does in ordinary parlance answer to the JTB account. I suspect many contemporary analytic philosophers cling to the JTB account, unmoved by ordinary language reasons of the sort cited, and that their allegiance to JTB will withstand practically all evidence of the sort derived from usage. They would appear to believe that the question of the proper analysis of the meaning of a phi-losophical term is not to be decided, or at any rāte not merely to be decided, on the basis of common usage. By what is it then to be decided? The question is an interesting one, since having passed over the evidence of usage one wonders what other evidence could be relevant, unless it were "evidence" of a normative nature to the effect that purposes of some sort are served better by say, the JTB account, than any other. Then the question what knowledge is becomes a normative one ("what *should* we mean by 'knowledge'?") and the result is that the JTB theorist cannot, on JTB assumptions, know that "knowledge" means JTB!

If we allow ourselves to ask "what should 'knowledge' mean?", admitting the question's normative character whatever that may imply, we raise the question of what purposes the JTB theory is supposed to help satisfy, and whether or not it does so successfully. I have darkly suggested once or twice that all is not well with the JTB account. The term "foundationism" has been proposed for those epistemologies which are committed to the tenet that empirical knowledge has, and must have, a "foundation",

"the claim that certain empirical beliefs possess a degree of epistemic justification or warrant which does not depend, inferentially or otherwise, on the justification of other empirical beliefs, but is instead somehow immediate or intrinsic."[35]

If, as seems likely on the basis of recent discussion,[36] foundationist theories generically must fail, and if (for ultimately similar reasons) coherence theories also must prove unsatisfactory, what is left? James' own version of "the pragmatist theory of truth" is hardly satisfactory either, for James reads out the theory in detail as a foundationist view couched in even more mysterious terms than current analytic accounts.

The general problem that foundationist theories face is that of answering the challenge laid down, e.g., by C. I. Lewis when he points out that "if anything is to be probable, something must be certain."[37] Basic beliefs fail as epistemic warrants taken singly for the simple reason that *any* belief by itself requires justification if it is to have any claim to providing a warrant for other beliefs. But pure sense-reports, though possibly incorrigible, are so only if they are construed in such a way as to provide no warrant for anything. "I seem to see green", by itself, provides no evidence that what I see *is* green, nor would one hundred people saying "I seem to see green" do so either, unless we are already supposed to be in possession of some knowledge making it likely that in this case or cases seeming to see green, or saying "I seem to see green", makes "it is green" more probable. But what could be the basis for *that* knowledge? Lewis suggests it might be a "pragmatic *a priori*" born of common human concerns and encoded in meanings, "criteria in mind", with which we face and make sense of the battery of sense-stimuli. While it seems to me Lewis was looking in the right direction when he looks to common human concerns, his own efforts to explore value theory (in *The Analysis ofKnowledge and Valuation)* suffer because he is unable to find a way of formulating those human concerns in a way which keeps in touch with actual valuings and stili retains the *a priori* character which they must have in order for his account to work. Whatever the merits of Lewis' attempts, and it seems to me they have a good deal of merit, they have not found fashion among epistemologists in recent years.

What is the trend nowadays? Once one has decided to abandon empiricism with a foundationist or coherence base, one direction to go is with Nelson Goodman to a kind of high-level relativism. Since "truth… pertains solely to what is said",[38] and what is said determines versions or worlds but not The World, Goodman's conclusion is that worlds are made as much as found, and that there may not be any such thing as The World – or if there is, The World turns out to be self-inconsistent when any attempt to

characterize it is made. In either case, his conclusion seems to be that if there is such a thing as The World, Reality, we are unable to speak of it.

Goodman's remarkable review of the current epistemological situation contains the following passage, which is pertinent to the state to which the discussion of this paper has brought us. He writes:

"The thesis that true statements are those that enable us to predict or manage or defeat nature has no little appeal; but some conspicuous discrepancies between utility and truth have to be explained away. That utility unlike truth is a matter of degree can perhaps be dealt with by taking utility as measuring nearness to truth rather than as a critarion of truth itself. That utility unlike truth is relative to purpose might seem less serious when truth is recognized, as in the preceding pages, to be relative rather than absolute. But relativity to purpose does not align in any obvious way with relativity to world or version; for among alternative true versions or statements, some may be highly useful for many purposes, others for almost none and indeed much less useful than some falsehoods…"[39]

The suggestion in this paper is that Indian thought adopts a utility reading of "truth" and thus what "knowledge" consists in features this very relativity to purpose. What, then, distinguishes the resulting view from skepticism or a relativism with the "discrepancies" that Goodman points to?

Goodman's discussion, like Mohanty's, operates under the presupposition that "knowledge" is true belief and that "truth" has a fixed antecedent sense which allows us, e.g., to ask with Goodman whether truth need serve any purposes. That last question, notice, makes sense only if we suppose that "truth" means something to us other than "serving some purpose". But if, as I have just attempted to suggest, truth in Indian philosophv *is* the serving of purposes Goodman's discrepancies cannot be expressed there.

There is a hidden reason why Goodman's relativism will, as the jacket to *Ways of Worldmaking* suggests, "incur the wrath of the rationalist, the enmitv of the empiricist, and the malice of the modalist, as well as the antipathv of the absolutist". That hidden reason is that in the Western versions of all four of those views – rationalism, empiricism, modalism and absolutism – there is a shared admission, which is that any hierarchy of values is even more questionable than the realistic hypothesis of a single reality, The World. To trade in faith in the given, or consistency, or relativity, or an absolute synthesis of theses and antitheses in favor of a fixed hierarchy of values is beyond the bounds of reason for modern Western philosophy. Why? Because all these lines of thinking tacitly agree on what I have called "noncognitivism" in value-theory. And it is an unavoidable consequence of noncognitivism in value-theory that no fixed relations of supremacy or subordination between values can be

demonstrated, for the simple reason that according to noncognitivism no conclusions about values can be demonstrated at all.

But the situation in Indian philosophy is entirely different. Though disagreements among views about whether there is One World, many worlds or no worlds abound there, what is agreed on among all the systems is that the supreme human purpose is liberation, and that there is a fixed, though context-sensitive, value system which coheres with that highest purpose. There is little or no disagreement among Jains, Buddhists and the various Hindu philosophical *darśanas* about values. What is a virtue for one is so for another. The evaluation of stages of progress toward liberation, it is agreed by all, involves overcoming ignorance and attachment. No doubt different philosophers develop their special terminology and emphases, but, as Western students puzzled over what is at issue between, say, the path-philosophies of Advaita, Buddhism and Yoga well know, the agreements far outweigh the differences as long as we conflne ourselves to the evaluation of activities designed to lead to ultimate value. Where differences in value theory appear to arise it is customary for the Indians themselves to explain that this ap-pearance only reflects the context-dependent differences in advice which a sensitive guru will give to pupils at different stages along the way.

By contrast, in Western contemporary thought not only is there lack of agreement as to ultimate purpose and the subsidiary goals leading to it, there is even general admission that we can't even address the question rationally, it being a matter of taste and "de gustibus non est disputandum". This is a radical divergence between the contemporary Western situation in philosophy and classical Indian thought; for that matter, there is the same divergence between modern and classical Western philosophy. The JTB account of knowledge is perhaps doomed as a futile attempt to provide a foundation in the absence of normative convictions which would constitute the proper, but now abandoned, core meaning of "knowing". Modern epistemology, getting the wrong message from Plato, perhaps, hoped that that core normativeness could be found in the necessities of formai (mathematical, logical) "truth", that is in consistency or coherence. We are now discovering that that is a forlorn hope, that inquiry is adrift without a recognition at least of the worth of what the inquiry is *for*.

The lost, core meaning of "I know" relates to my awareness that my actions are proceeding satisfactorily or unsatisfactorily toward an intended

outcome. "I know what I am trying to do", "I know what I want" are expressions which provide examples of this core meaning. Notice that *what* I know, in these locutions, is an action or volition. As soon as we try to *describe* what it is that I want or am trying to do, doubts may set in. "Are you really trying to do *that*?" is a fair question, suggestion one may not be clear about what his purposes are or ought to be. Knowing that *p* is likewise subject to doubt in the same way, and so no knowledge – *that* can possibly provide the certainty which will ground probability and answer Lewis' challenge. My knowing *what* I am trying to do, on the other hand, is like knowing some thing "by acquaintance" – I have a certainty about what I want which is unlike my certainty that 2 + 2 = 4 but is akin to the alleged certainty about sense-data postulated by phenomenalists. The difference between sense-datum reports andreports of wants and actions is that, whereas sense-datum reports, though perhaps indubitable, cannot ultimately provide the certainty to ground empirical claims, since they are themselves not claims, reports about what one intends or wants are both claims (*pace* the noncognitivist) and indubitable. One might grant this and stili flnd such value-reports irrelevant to the problem of justifving what are allegedly value-free claims of scientific knowledge. This is noncognitivism resurfacing at a deeper Ievel. I cannot here hope to set the noncognitivist challenge to rest, nor is it the purpose of this paper to do so. What this paper is arguing is that Indian philosophy, not being wedded to a noncognitivist approach, thinks it can talk of knowledge (or rather, *ofprama)*, but in a sense of "knowledge" different from the current notions predicated on noncognitivism.

The incommensurability thesis is incorrect, then, as an interpretation of Indian theories of knowledge, because there is agreement there about ultimate values, so that construing "prāmāṇya" as workableness does not produce a stultifying relativism or skepticism. To the extent that such agreement is absent from Western philosophical thinking, to turn the coin over, it is to that extent inevitable that there can be no meeting of minds between East and West. One lesson to be learned is that, in analyzing the views of other cultures one must be careful not to import theses held by one's own culture but not by theirs. A deeper message is this: that there may be no middle ground between commitment to absolute values on the one hand and epistemological skepticism on the other. Mathematics does not provide that middle ground. Can holistic conceptions, unguided by flxed

normative concerns arising from human purposes to be served hope to justify knowledge claims?

Contemporary Western thought is going through a phase of practicality; there is a call for relevance. Relevance to what? Surely, to concerns viewed as so widespread and pressing as to far outweigh the doubts of the epistemological skeptic. These concerns, and the widespread recognition of them, suggest that there is more thoughtful agreement on a hierarchy of values than the noncognitive assumptions of positivist value theory can make sense of. If so, and if the ultimate concerns of human beings do indeed, when carefully studied and compared, transcend the apparent idiosyncracies of cultures, then the incommensurability of thinking between East and West may turn out to be a goblin of our own making, the shortcoming of a phase in Western thought which, whatever its positive contribution has been, is proving too rigorous for our good in its conceptions of knowledge, truth, and what makes life worth living, or dying, or ultimately leaving for good.

[13] Sometimes "jñāna" is used to mean "(pure) consciousness". This is a different use of the term from the one studied here.

[14] Mohanty (GTT, p. 25) argues that a "jñāna is not an activity, but a product" (citing Javanta Bhatta) "to call it an activity would, firstly, amount to an unusual extension of the ordinary notion of act, involving the notion of movement (*spandana*); but secondly, it is not admitted by the definitions underlying the Nyāya ontology". But when I call a *jñāna* an act I do not mean that it is a motion, nor I suppose do (e.g.) all those Indian philosophers who classify acts (*karman, kriyā*) into three kinds of which one is "mental act" think that the mind moves. And while Jayanta is correct that a *jñāna* is not a member of the third Vaisesika category (of *kriyā*) and is a result (*phala*), I don't see that this makes calling a *jñāna* an act an unusual extension of the English term "act" or "activity", since surely we do speak of, say, calculation as a kind of mental activity.

[28] *Ibid*.

[29] GTT, p. 76.

[30] In the Prābhākara and Bhātta versions of the *svataḥ* theorv we do not become aware of the *prāmānya* of J_1 through an aftercognition, but rather, in the case of Prābhākara, J_1 itself vouchsafes its own *prāmāṇya* and for the Bhātta, we draw an inference from the knownness *(jñātatā)* which characterizes the content as a result of our cognizing it.

[31] I choose "workable" rather than, say, "working" for reasons familiar both from James' writings and from Dharmakīrti's recognition that so as not to exclude nonspeakers from cognition conceptual

construction must be defined in terms of "capabilitv of coalescing with a verbal designation" (*abhilāpasarṇsārgayogyapratibhāsāpratītih kalpanā*…), Peterson edition of Dharmakīrti, op. cit., p. 103, fourth sentence of text, and Th. Stcherbatskv's translation of it in *Buddhist* Logic, Vol. II (Dover: New York, 1962), p. 19.

Knowing that one knows

All Souls College, Oxford

1. RIVAL THEORIES ABOUT KNOWLEDGE OF KNOWLEDGE

Writing in 1962, Jakko Hintikka argued that '*a* knows that *p*' always implies '*a* knows that *a* knows that *p*'. Some contemporary philosophers agreed while others (such as, Arthur C. Danto) disagreed. The issue, however, has not been much discussed in contemporary analytical philosophy, while in the classical Sanskrit tradition of India it generated a vortex of controversy. It had various ramifications which were discussed by philosophers of very different persuasions. It was believed that the issue strikes deep into the heart of the philosophic opposition between realism and idealism, materialism and mentalism. In other words, it became a very central concern among philosophers who flourished between A.D. 500 and A.D. 1200 in India. In what follows I shall not discuss whether this concern was justified or not, but try to present the argument of the ancients about the main issue in its richness and diversity. Towards the end, I shall argue why Hintikka's view cannot be accepted and why the opposite view of Nyāya fares better.

To appreciate fully the intricacies of the problem one needs to discuss the background to some extent. The arguments of the ancients are admittedly arduous, if not a bit daunting. But I am convinced that they are worth the effort. For they certainly deepen our understanding. The classical Indian philosophers assumed an 'episodic' view of knowledge, and their discussion centres around this concept. Therefore, knowledge in what follows would be regarded as a knowing event, an 'inner' episode, and an awareness as an awareness-event.

In claiming that knowing is an 'inner' episode classifiable with other similar episodes, we do not and need not claim that knowing consists in being in a special (infallible) state of mind. For if such a state of mind means that

we possess some 'inner search-light' (Ayer) which guarantees absolutely the truth of the experience or the reality of the object upon which it is directed, then it will be, as Ayer has pointed out, patently wrong.[1] I am not taking issue here with the Phenomenologist (for this is at best a caricature of E. Husserl), but I wish to reject the hypothetical position that may endorse the 'inner searchlight' theory. It is generally agreed that if something is known, it must be true or it must exist. Nyāya says that this fact does not warrant us to say that if one knows, then necessarily one knows that one knows; and this holds even when one is quite convinced about what one knows. One may, in fact, be absolutely sure about what one cognizes, but such a certainty neither contributes to knowledge nor becomes an essential ingredient of it.

Nyāya conceives the matter roughly as follows. A verbalizable cognitive episode can be either a knowing episode or a 'non-knowing' episode, such as an illusion or a doubt. It is a knowing episode when it hits the 'truth'. Knowledge-ness consists in its truth-hitting character, and not in its indubitability or in its constructive character. When it misses truth it is a 'non-knowing' awareness-episode. Even an archer cannot always hit the bull's eye. Nyāya fallibilism says that if it is possible for him to hit it, it is also possible for him to miss it. If he hits it, it is not by being absolutely sure that he does so. There are other causal factors that are responsible for making the incident a successful one. It may be true that the archer hits the mark *mostly* when he is absolutely sure, and similarly a man may feel absolutely sure when he knows. But the point is that the fact of hitting the mark or missing it is independent of the presence or absence of such certainty.

Let us try to formulate different theses of rival (classical Indian) philosophers in clearer terms. Let 'c_1', 'c_2'…stand for individual cognitive events or awarenesses. When I am aware that p, a cognitive event arises. I may be truly aware that p or it may be that I am falsely aware that p (if p is not the case). Let us say that I *know* that p if an only if I am truly aware that p. I may be aware that p but do not know that p, in which case I oscillate between *that p* and *that not p*. Let us say that I have a doubt (*saṃśaya*) if and only if I am dubiously aware that p in the above manner. A knowing event is a special kind of cognitive event (or awareness-event), for I have to be *truly* aware. Let us say that a cognitive event is a knowing event if and only if it has (acquired) a specific feature, k; it is an illusion or a doubt if and only if it has a different specific feature, d. (To avoid complexities, let us for the moment ignore other types of cognitive events, e.g. remembering, intuition and dreaming, although they are found in the list of Praśastapāda.) If we

accept this convention, then 'c_1+k_1', 'c_2+k_2'…will stand for individual knowing events, and likewise 'c_1+d_1', 'c_2+d_2'…for individual illusions or doubts.

I would like to introduce at this stage a transitive verb 'caps' which should go between the name of a cognitive event and that of its object (where the object may be either a simple thing, *a*, or a complex entity having a propositional structure, *that p*.) For example, if I am aware of the cat called Pussy, the cognitive event 'caps' Pussy. If, however, I am aware that Pussy is on the mat, then the event 'caps' *that* Pussy is on the mat. We may now formulate the following positions of rival Indian philosophers:

T_1:   If c_1 arises, it caps not only *a*, or *that p*, but also c_1 itself by the same token.

T_2:   If c_1 arises, it caps only *that p* (or *a*), and then c_2 arises to cap c_1 ($c_1 \neq c_2$).

The Prābhākara Mīmāṃsaka and the Buddhist of the Diṅnāga school accept T_1 (The Advaitins also accept it but understand it in a different way which we will forbear to go into here.) The Prābhākara calls it 'the self-revelation theory of awareness' (*sva-prakāśd-vāda*), while the Buddhist calls it 'the selfawareness of awareness' (*sva-samvedana-vāda*),

According to the Prābhākara school, there is also a third party, the knowing self, which is also revealed besides the object and the cognition itself. The prevailing view (Śālikanātha's) is that each cognitive event is a sort of perceptual event revealing the trio, the object grasped, the fact of grasping (i.e. the cognition) and the knower self (cf. *tri-puṭi-pratyakṣatd-vāda*). Hence according to this view, knowledge that this is a cat is always verbalizable as 'I know that this is a cat', which makes explicit reference to the trio 'capped' by the event (the first two words referring to the last two members of the trio, and the *that* clause to the first). An older view belonging to the same school is, however, formulated in a slightly different way. It says that it is counter-intuitive to say that event c_1 'caps' anything else beyond its object (*a* or *that p*). Instead both the cognition itself and the knowing self are such that they become, unlike the object 'capped' by c_1, the subject matter of *vyavyahāra* (i.e. become publicly discussable objects, etc.) solely by virtue of event c_1 itself. In other words, I can talk about the cat Pussy when and only when I

have had an awareness of it (i.e. my c_1 has 'capped' it) and this is true of any other object I may be aware of, but this does not mean that I have to be aware of c_1 or the knowing self in order to talk about them. The last two can be talked about (cf. *vyavahāra*) provided only c_1 has arisen, it is not necessary for c_1 also to 'cap' them. In the light of this ancient view of the Prābhākara school, T_1 has to be modified as: if c_1 arises, then just as the object 'capped' by c_1 is usable for *vyavahāra*, c_1 should also thereby be usable for *vyavahāra* (i.e. fit for public discussion, for being talked about for being remembered, etc.), even when c_1 is not aware of itself. Śālikanātha, however, prefers the unmodified T_1.[2]

In Buddhism, however, there is no third party besides the cognition and what it grasps as the object. T_1 needs no modification for the Buddhist. Each awareness is also a case of self-awareness. Here c_1 caps the particular object as well as c_1 itself. Just as an occurrence of pain arises and makes itself known by a single stroke, a cognitive event arises and makes itself known at the same instant. Each event of the cognitive kind has as its integral part an 'inner' (mental) perception of the event itself. This reflexivity of awareness is unavoidable for, the Buddhist argues, one cannot remember what one did not know; and since we do remember that we *knew* whatever we knew or were aware of, we must have known that we knew or were aware that p (see next section).

Both the Buddhist and the Prābhākara seem to agree on another point: if c_1 arises it is necessarily cognized. This leads to another pair of disputed positions:

T_3: If c_1 arises, c_1 is necessarily cognized (known).

T_4: If c_1 arises, it is only possible that c_1 is also cognized, i.e. it is possible for some c_1 to come into and go out of existence, without being cognized at all.

T_1 implies T_3, and hence both the Buddhist and the Prābhākara Mīmāṃsaka will have to accept T_3. T_2 under some interpretation may be compatible with T_3 and hence the two can be combined to say that if c_1 arises, c_2 must arise.

This presumably gives the view of the other two Mīmāṃsakas, the Bhāṭṭa and the Miśra (the followers of Murāri Miśra). In this case c_2 can be an 'inner' perception (cf. *anuvyavasāya*), but in any case it would be an occurrence distinct from c_1. Or as the Bhāṭṭa would say, c_2 may be an *automatic* inference when c_1 has arisen.[3] (It may be doubtful whether the Bhāṭṭa would stick to this position in the final analysis, but I will not enter into that problem here).

T_4 is rather a controversial thesis, for it may be claimed to be counterintuitive. But Nyāya boldly accepts T_4 along with T_2. This means, in short, that c_2 may or may not arise even if c_1 has undoubtedly arisen. T_1 and T_3 jointly say that if Iam aware that p, I am necessarily aware that I am aware that p. T_2 and T_4 on the other hand, say that if somebody, S, is aware that p, it does not necessarily follow that S is aware that he is aware that p.

The above positions have been formulated in terms of *cognitive* events in general. What would be the view about the *knowing* events in particular? There are two different issues involved here. The first concerns the origin (*utpatti*) of the knowing events, while the second is about the knowledge of a knowing event, i.e. knowledge of the event as a piece of knowledge. As regards the former, we can formulate again two rival positions:

T_5: Whatever causes c_1 to arise causes, by the same token, $(c_1 + k_1)$ to arise.

T_6: Since $(c_1 + k_1$ is a special case of c_1, for such an event to arise some additional condition, G, is needed over and above H which causes c_1.

Regarding the knowing of an awareness-event, the following rival positions can be formulated:

T_7: Whatever causes the knowing of c_1 causes, by the same token, the knowing of $(c_1 + k_1)$.

T_8: Whatever causes the knowing of c_1 cannot cause the knowing of $(c_1 + k\pm)$ by the same token; some additional condition is needed to make $(c_1 + k_1)$ known.

There seems to be a natural connection between T_5 and T_7 as well as between T_6 and T_8. All the Mīmāṃsakas (i.e. Prābhākara, Bhāṭṭa and Miśra) accept the former pair. Nyāya accepts the latter. The Mīmāṃsakas argue that a cognitive event arises under *normal* conditions as a knowing event until and unless some 'bad' factors intervene to upset normalcy. When 'bad' factors intervene, a defective cognitive event (a misperception or a dubious awareness, $c_1 + d_1$) arises. Therefore, according to this view, the totality of causal factors generating c_1 needs the intervention of additional *bad* factors (cf. *doṣa*) to generate $(c_1 + d_1)$. This is similar to saying that mangoes are *naturally* sweet or man is *naturally* good but that intervention of *bad* factors in the *normal* circumstances can make it possible to produce non-sweet (sour) mangoes; similarly, *bad* extraneous circumstances can make a man bad.

Nyāya, on the other hand, holds the opposite view. Instead of talking about 'normal' circumstances for generating a cognitive event, Nyāya (cf., Gaṅgeśa) talks about a set of *general* causal conditions along with a set of *specific* causal factors in each case of a cognitive event. If and when c_1 arises, it would be either $(c_1 + k_1)$ or $(c_1 + d_1)$, just as when a mango grows it is either sweet or not so. Therefore, the set of general causal factors for generating c_1 must always be attended with either a set of goo d factors in order to generate $(c_1 + k_1)$ or a set of bad factors to generate $(c_1 + d)_1$.

Let us note that T_2 can be combined with T_5 and T_7 to yield the view of the Bhāṭṭa and Miśra. For saying that c_2 'caps' c_1 is compatible with saying that whatever generates c_1 generates by the same token, $(c_1 + k_1)$. Further, even if we need c_2 to 'cap' c_1 (for c_1 cannot reflexively 'cap' c_1), we might still claim that whatever generates the knowing of c_1 generates also the knowing of it as $(c_1 + k_1)$. Notice that the difference between knowing c_1 and knowing $(c_1 + k_1)$ is similar to that between knowing that it is a mango and knowing that it is a sweet mango. The Mīmāipsakas would say that knowing c_1 is like tasting a mango; and hence if you have tasted it, you have tasted it as sweet. Nyāya, on the other hand, could argue that knowing c_1 may be like seeing a mango, and hence when you see it you cannot know that it is sweet and you need a different means (that of tasting) in order to know that it is sweet.

There is a further complication when we ask about the knowledge of a defective cognitive event, i.e. knowing of $(c_1 + d_1)$. Corresponding to T_7 and

T_8, we can formulate:

T_9: Whatever causes the knowing of c_1 causes by the same token the knowing of $(c_1 + d_1)$.

T_{10}: For the knowing of $(c_1 + d_1)$ to arise, some extraneous condition is needed for whatever causes the knowing of c_1 to arise cannot be sufficient to cause the knowing of $(c_1 \pm d_1)$ to arise.

Four possible combinations of T_7, T_8, T_9 and T_{10} yield, according to the post-Gangeśa writers, four well-known positions. T_7 ken together T_7 and T_9 give the SāŁkhya view, T_9 and T_{10} the Bhāṭṭa view. T_8 and T_9 yield supposedly the Buddhist position, while T_8 and T_{10} give clearly the Nyāya position.[4]

Roughly stated, the SāŁkhya says that when I know that I am aware that p, I also know by the same token that I am aware, truly or falsely as the case may be, that p.[5]

The Bhāṭṭa says that when I know that I am aware that p, I also know by the same token I am *truly* aware (i.e. know) that p. However, if I am falsely aware (misperceive or misjudge) that p, I would have to depend upon some extraneous condition in order to know that I am *falsely* aware that p. For example, if I misperceive something as a tree-trunk, some other evidence will tell me that I have misperceived; my knowledge of the awareness itself will be of no help. This view may be endorsed by other Mīmāṃsakas.

The Buddhist (supposedly) says that even if I know that I am aware that, p, I would not know by the same token that I am *truly* aware that p. I would need an extraneous condition to know that I know, i.e. be truly aware, that p. Thus Dharmakirti insisted upon successful activity as evidence of our knowing that I had a piece of knowledge of the fact with regard to which our activity has been successful.[6] Butif Iamfalsely awareof something, my knowledge of this awareness would be sufficient for my knowing that this is a false awareness. It is difficult to find support for this latter half of the thesis in the available Buddhist texts. Probably this is a reformulation (by the Naiyāyikas) of the Buddhist viewpoint according to which all constructive judgements (cf. *vikalpa*) are by definition false, and this would be known as soon as their constructional character is known. According to Buddhism, a construction with the help of concepts is always propelled by our desires and

drives for pleasure, etc. and hence by definition it represents a distortion of the reality. We *construe* as we would like, or ardently desire, to see reality, not as reality actually is!

Nyāya says that when I know that I am aware that *p*, I do not know whether I am truly aware or falsely aware. I have to depend upon some extraneous condition in order to know that I know, i.e. am truly aware. I need extraneous condition even to know that I am falsdy aware.

All the positions mentioned above were supported by some argument or other. I will not go into those arguments here. In view of my general purpose I shall try to develop first, the Buddhist view of self-awareness, then the Nyāya position, in order to see whether the sceptics can in any way be answered from the point of view of these philosophical positions.

2. SELF-AWARENESS

If I am aware that *p*, then it is generally assumed that I am also aware that I am aware that *p*. This general pre-theoretical assumption seems to gloss over several philosophical issues which the classical Indian philosophers thought relevant and important as I have already indicated in the previous section. The assumption implies that although what we are aware of or what we cognize is, by and large, an object, an external object, a non-mental, physical object, we can also be aware of the mental events happening 'inside'. We can be aware of an awareness itself. The traditional 'subject' can become also the 'object'. An apprehension itself is also apprehensible (*grāhya*).

A simple argument can be given to show that we must be cognizing our 'cognitions' too along with the 'objects'. We cannot remember what we have never cognitively experienced. How do we remember not only what we have cognitively experienced but very often also that we have cognitively experienced them? Therefore, it is reasonable to assume that we must have been cognitively aware that we experienced whatever we had cognitively experienced. Now the question arises: how and when do we become aware of our own awareness?

There are usually three views on this matter in classical Indian philosophy. First, a cognitive event is self-cognizant. That is, an awareness may be reflexively aware of itself. Second, it may be cognized by another cognitive event, by what has sometimes been called introspection 'inward' perception (cf. *anuvyavasāya*)—an event that *immediately* follows the first event. Third,

I may be reflectively aware, i.e. infer that I must have been aware of such and such things on the evidence that such and such things appear as known to me (cf. *jñātatāliṅ;gakānumāna*). Of these three, let us take a close look at the Buddhist version of the first position: c_1 reflexively 'caps' itself.

After defining perception as a cognitive event which is entirely free from conception or imaginative construction (*kalpanā*), i.e. unassociated with names and concepts, Diṅnāga asserted that this essential character of a perceptual awareness would be applicable even to what we may call 'mental' or 'inner' perception of two kinds.[7] One kind of 'inner' perception presumably cognizes the material form (*rūpa*), i.e. the external object, while the other kind cognizes desire, anger, ignorance, pleasure, pain, etc. Diṅnāga's own passage is enigmatic here and I have followed Hattori, who followed Dharmakīrti in interpreting this passage. Diṅnāga's cryptic statement here created a great deal of exegetical confusion among the later commentators. Recently M. Nagatomi has called it '*a* conundrum in the Buddhist Pramāṇa system'. He tried to resolve the issue as follows.[8]

The problem lies to be sure with the above-mentioned first variety of 'mental' perception. The second variety is more or less recognizable as a variety of perception (in the sense defined) and generally accepted by the commentators without question. It is called *sva-samvedana* 'self-awareness', i.e. the self-luminous character of all mental events, beginning from human passion to the Buddha's compassion. All these events make their presence known (as soon as they arise) without requiring a further event. But what could be the possible case of the first variety? How can an external object, such as colour, be 'capped' by a mental perception and be at the same time, as the requirement demands, non-conceptual or unconceptualizable? Some commentators believe that Diṅnāga had to talk about a 'mental' perception which is on par with the five kinds of sense perception in order to be faithful to the tradition of the Buddhist scriptures! The Buddha mentioned a variety called *mano-vijñāna,* side by side with the other five types of sensory awareness. Mokṣākaragupta quoted a saying of the Buddha which reads as follows: 'Colour-form is cognized, oh monks, by twofold cognition, the visual perception and mental perception induced by it.' The saying was quoted by Mokṣākaragupta in order to justify his contention that although the mental perception of colour, etc. is not commonly experienced by ordinary people,,it might well have been the case with the Buddha's experience.[9]

Nagatomi argues that Diṅnāga in the passage referred to did not talk about *two* types of mental perception but only about one type with a twofold aspect. If this means that the event called mental perception is identical with the selfawareness part of each mental event, then I readily accept the interpretation. Dharmakīrti explicitly stated in the *Nyāyabindu* that all mental events (*citta* = a cognitive event as well as *caitta* = derivatives of the cognitive event, pleasure, etc.) are self-cognizant.[10] It is possible that Diṅnāga only referred to the twofold appearance of the self-cognitive part of the event: the object-appearance (that aspect of a mental occurrence which makes an intentional reference) and the appearance of the cognition itself (the cognizing aspect). Since pleasure, pain, passion, anger, etc.—all such mental events are also cognitive in character according to the standard Buddhist view and by the same token self-cognitive, Diṅnāga might well have intended to emphasize the double feature that self-awareness of such events captures: the object-aspect as well as their 'own' aspect.

Each mental event in this theory has a perceptual character and this includes any cognitive event, sensory perception, inference, conceptual judgement, etc. It is in each case their self-awareness. Self-awareness is a kind of perception because it is a mental awareness that is free entirely from conception and construction. It forces itself into a non-mediated (non-conceptual) grasp of itself. It is called 'mental' or 'inner' because the external sense-faculties are not directly responsible for such a non-mediated grasp of itself (cf. Diṅnāga: *indriyānapekṣatvāt*). Suppose I now close my eyes and think of my beloved. My thoughts will be invariably attended with passion, etc. (the *caitta*). This particular mental event is certainly not free from conceptual construction for only an *idea*, a concept, of my beloved, and not she herself, is grasped by my awareness. But my awareness itself as well as my passion or other emotive experience is self-aware. Thus self-awareness of any mental event is conception-free and hence a 'perception', *a la* Diṅnāga. He says: 'Even conception (or conceptual judgement) is admitted to be (a sort of perception) as far as its self-awareness is concerned. It is not (a perception) with regard to its object because it indulges in conceptualization.'[11]

Diṅnāga repeatedly insists in the first chapter of his *Pramāṣa-samuccaya* upon the dual aspect of each cognitive event: the object-aspect and the cognizing aspect (*arthābhāsa* and *svābhāsa*), more commonly known in the Yogacāra system as the apprehensible-form (*grāhyākāra*) and the apprehensionform (*grāhakākāra*). Later on his *arthābhāsa* transpired as *arthākāra*, the 'object-forn' of the cognition, in the wiritings of the post-

Diṅnāga exponents and hence the nickname *sākāra-vadin* (*sākāra* = 'awareness with an object-form') was given to this school. If the object-appearances ('blue', 'yellow', 'hard', 'round', etc.) are inherently distinguishing marks for particular cognitive events, then the claim (of the Sautrāntika) that external objects are causally responsible for the arising of the object-appearances or object-LIKENESS (*sārŋpya*) seems to dwindle. This position became very suitable for the Yogācāra school to which Diṅnāga belonged. For instead of saying with the old Yogacarins that the external objects do not exist, for nothing but consciousness (awareness) exists, one can now say along with the exponents of the Diṅnāga school that in this theory of awareness and mental phenomena in general references to external objects are dispensable.

Diṅnāga advanced some arguments to show that an awareness has always a twofold appearance and later added that even self-awareness of an awareness is proven thereby. Thus it has been said (I follow Hattori's translation):

> The cognition that cognizes the object, a thing of color, etc. has (a twofold appearance, namely,) the appearance of the object and the appearance of itself (as subject). But the cognition which cognizes this cognition of the object has (on the one hand) the appearance of that cognition which is in conformity with the object and (on the other hand) the appearance of itself. Otherwise, if the cognition of the object had only the form of the object, or if it had only the form of itself, then the cognition of cognition would be indistinguishable from the cognition of the object.[12]

To explain: let c_1 stand for a cognitive event which can be described as my awareness of blue. We can distinguish between its two aspects, the blue-aspect and the cognition aspect, of which the latter grasps the former; if the same event has also self-awareness, then this 'self-awareness' aspect is to be distinguished from the cognition-aspect in that the self-awareness aspect picks out the cognition-aspect as distinguished by the blue-aspect while the cognitionaspect picks out the blue-aspect only. Now if instead of the dual aspect, my awareness had only one aspect, either the blue-aspect or the cognition-aspect, then the awareness of the awareness, the self-awareness, would be indistinguishable from the awareness itself. How? Suppose the cognition has only the blue aspect to qualify it. We would then have an awareness taking the blueaspect for its object and another awareness, i.e. self-awareness, also taking the blue-aspect for its object. This will collapse the

distinction between awareness and self-awareness. If, on the other hand, the cognition has only the cognizing aspect (no object-aspect), then also the distinction between awareness and self-awareness will collapse. For both will be marked by the same cognizing aspect.[13]

Further, it is argued by Diṅnāga, there is another fact that can be happily explained under the assumption of the dual aspect of a cognitive event. Sometimes an object cognized by a preceding cognition appears in a succeeding cognition. But this would seem impossible since the objects are, according to the Sautrāntika Buddhists, in perpetual flux and, therefore, the object ceases to exist when the succeeding cognition arises. But admission of the dual aspect saves the situation here. For we can say that at moment t_1 there arises a cognitive event, c_1 which grasps the blue, b_1 as its object (presumably b_1 being there at t_0,) and at t_2, c_2 arises and grasps not b_1 but c_1 as an event which has the dual appearance. This will show that c_2 grasps 'the b_1 -appearance' of c_1 which is part of its dual appearance (it does not grasp b_1 directly). For b_1 being in a state of flux cannot be present at t_2. This argument provides an explanation of the common-sense belief that an object grasped in a cognition can be grasped by several succeeding cognitive events, but it is not clear whether it accomplishes anything else.

Diṅnāga gives next his major argument. Our recollection is not only of the object previously cognized but also of the previous cognition itself. This proves not only that a cognitive event has a dual aspect but also that it is self-cognized. For 'it is unheard of', says Diṅnāga, 'to have recollection of someting without having an experience of (it before)' If, as the Naiyāyika claims, a cognition is cognized by a separate cognitive event, then, says Diṅnāga, an infinite regression would result and there would be no movement of thought (cognition) from one object to another.[14]

Śāntarakṣita gave another argument in favour of self-awareness. An awareness cannot depend upon another awareness in order to make its presence known, nor could its presence remain unknown. Therefore self-awareness must be the natural trait of any awareness.

The usual objection against the 'self-awareness' nature of a cognitive event was well answered by Dharmakirti and Śāmtarakṣita. It may be said that even a very well-trained dancer cannot climb up his or her own shoulder, and even the sharpest sword would not cut its own blade. Hence how can a cognition cognize itself? As against this, it is pointed out that a lamp or light illuminates itself. In other words, the act-agent relationship need not always

follow the model of a wood-cutter and a tree. It could illustrate the relation of the determinant and the determinable (cf. *vyavasthāpya-vyavasthāpaka*). Besides, to say that a cognition is self-cognizant is simply to say that a cognition is a nonmaterial entity (*ajaḍa*), very much unlike a material object. Self-awareness is what constitutes the *essence* of the mental events, (events such as an awareness, and any attendant emotive facts such as passion and anger).

It is held that cognitive event is actually a partless whole (cf. *niraṃśa*). The so-called division of it into aspects or features or appearances is only imagined. Hence it is only a provisional division. Thus for Śāmtarakṣita:

> The self-awareness of the awareness need not be analysed into the (model of) the action and the agent (and the object), for it is a single unity without parts, and hence cannot be divided into the three parts (the cognizer^the agent, the cognition the action, and the cognizable the object).

In sum, it is climed that self-awareness of an awareness is experiential. An echo of this claim is found in Dharmakirti's often quoted line from the *Pramanaviniścaya*: 'If an awareness itself is not perceived, the awareness of the object would never be possible.'[16] It is, however, not absolutely clear whether experience could positively establish also the *reflexivity* of awareness. For it is possible to be *reflectively* aware of another awareness. This brings us to the second and the third alternatives preferred by the Nyāya and the Bhāṭṭa respectively.

3. MUST I BE AWARE THAT I AM AWARE?

We have now to work with the idea that one is *reflectively* aware of one's own awareness. Awareness does not have self-awareness (i.e. awareness is not, among other things, *reflexive*). One may be *reflectively* aware of one's own awareness that something is the case in either of the two ways: by an inference or by an *inward* perception arising in the next moment. In fact, both may be designated as 'reflection' (in the Lockeian sense?) or 'introspection'. Locke, in fact, defined Reflection as 'that notice which the mind takes of its own operations, and the marriage of them, by reason whereof there came to be ideas of these operations in the understanding'.[17] This notion of 'reflection' seems to be closer to that of the *inward* perception (although not

that of the Buddhist 'self-awareness') than that of an automatic inference. It is not very clear whether Locke was aware of the distinction that we are talking about here. Besides, Locke identified Reflection as one of the two sources of knowledge (the other being Sensation) and there are many other problems involved here. For all these reasons, I would avoid translating *anuvyavasāya* (which is said to perceive *inwardly* the immediately preceding cognitive event) as 'reflection' or 'reflective awareness' (as some modern exponents of Nyāya have done). For almost the same reason, I would avoid using 'introspection' in this context. 'Introspection' is sometimes regarded as a modern version of the old 'reflection'. It has also been given a much broader function to perform in psychology. For William James, introspective observation is the principal method of psychology. In fact for all we know, both these terms may be very intimately connected with the notion of an *inward* perception or an *automatic* inference. However, it seems to me, 'introspection' generally stands for a set of different, sequential, but not often homogenous, mental episodes which are cognitive in character. In fact, a number of *inward* perceptions or *inferences* may be members of this set. Thus, to keep in our mind the episodic nature and singularity of the 'inward' perception (*anuvyavasāya*) as well as that of the automatic inference (*anumāna*) of the awareness episode, I would not use the term 'introspection' here. For *anuvyavasāya* I shall use 'inward perceptual determination' (sometimes *inward* perception), for *sva-samvedana* 'self-awareness' or 'inner perception' and I would let the distinction between them (that the former occurs in the immediately succeeding moment while the latter is an integral part of each awareness-event) be understood from the context.

We still operate here on the general assumption that if there arises an awareness, there arises also an awareness of the awareness, though not simultaneously. Hence we have still not gone against the commonsense notion that it is impossible for one to be aware of something without being aware that one is aware. Transition to the Nyāya view will take us beyond this position. For we will then say that it is *not* impossible for somebody to be aware of something without bis being aware that he is aware (see T_4 of section 1).

One may argue that this is highly improbable. For if man is aware at all of something without being aware that he is aware then certainly something must be wrong with him, for it would be grossly inconsistent. But this oddity can be dispelled. Our uneasiness here lies in the fact that a person cannot claim or say that he is aware that *p*. How many times, looking at a child's

behaviour, we can say that he is aware that *p* but not exactly aware that he is aware? J. Hintikka used two distinct notions of implication, the *epistemic* implication and the *virtual* implication in order to argue in favour of the thesis that we are talking about here (i.e. the Nyāya thesis, T_4). According to him, 'I am aware that *p*' *epistemically* implies (epistemic implication being defined in terms of a clearly defined notion of epistemic *indefensibility*) 'I am aware that I am aware thatp', but '*a* is aware that *p*' does not *virtually* imply (virtual implication being defined in terms of indefensibility *simpliciter*) '*a* is aware that he is aware that *p*'. If Hintikka's argument is right, then it lends additional support to the Nyāya thesis, T_4, to which we must now turn.[18]

It is obviously true that we cannot recall what we have not cognitively experienced. Nyāya readily accepts this point but goes on to point out that we do not recall everything that we have cognitively experienced. This does not always mean that my memory-impressions on such occasions have been lost. It may mean *occasionally* that I did not have a memory-impression to begin with! The general theory about memory-impression is that a memoryimpression of a particular object is generated (no matter how 'faint' the impression may be) as soon as the object is cognitively experienced. (A hypnotist can evoke from us sometimes recollection of an object which we had normally taken to be *not* experienced at all). But certainly we cannot recall what we never experience cognitively. This must be true of our awareness and other mental events when they play the role of the object of remembrance. Therefore, if under all possible provocations, I cannot recall that I had an awareness of (i.e. a perception of) an object, it is reasonable to assume that I did not have an awareness of that awareness of the object. It may be that I cannot remember that I had seen something at the moment I fell asleep, while an argument can be given to show that some seeing (perception) must have arisen at that moment; for I was awake, the lights were on, my eyes were open, etc. This will then prove that the presence of a cognitive event at a particular moment does not necessarily imply the presence of the awareness of the cognition. For I now understand, by the force of the argument suggested, that I *saw* something at that moment. This understanding is not remembering.

Nyāya further argues that it is possible to remember many objects without our necessarily remembering that we had once experienced these objects. We may now surmise or 'see' that we had experienced cognitively those objects, but this new awareness would not be a revival, i.e. the memory-impression of

the cognition itself. Such a state of affairs would be compatible with the view that we had experienced (cognitively) those objects, but we did not have the awareness of the cognitive experience until now; and for this reason we have been unable to recall it.

Nyāya says that it is not always necessary (cf. *avaśya*) that one should be aware of one's awareness either simultaneously (as soon as the awarenessevent arises) or at the immediately succeeding moment. I have tried to show that this view, although it initially strikes us as somewhat odd, is not incompatible with known and commonly accepted facts. We can explain our memory of many previously experienced objects, and on the evidence of such memory we can infer that such and such cognitive experiences must have taken place; but there is no logical compulsion here to say that we must have had also the awareness (inward perceptual recognition) of such and such cognitive experiences. For the Buddhist, self-awareness is an *essential* (necessary) property of each awareness. But if this is denied, the intermediate view is that the awareness of an awareness is an *invariable* concomitant of each awareness (invariably arising immediately afterwards). Nyāya goes further and says that the awareness of an awareness is only accidental (contingent), for it may or may not arise immediately afterwards, or may not arise at all.

Another good argument in favour of T_4 is that it becomes necessary to save realism as well as our pre-theoretic assumption of the possibility of our knowledge of the external world from the attack of such idealists as Dharmakārti. The usual counter-argument against Nyāya is this. If we admit that an awareness-event can occur in a person about which event he is unaware, we make a mental event as good as a 'material object' (*jaḌa*), for both the mental and the material can exist unperceived or uncognized. This consequence leads to materialism. Nyāya will accept the charge, for otherwise mentalism or idealism would win the day! For the usual mentalistic strategy is to introduce an insurmountable barrier between the mental and the non-mental (material), and then claim that the mental (a cognitive event, a mode of consciousness) cannot be connected with the material object unless it transforms the latter into a mental object. This would, therefore, create what has sometimes been called the 'veil of ideas'. An argument can usually be developed to show eventually that this veil of ideas becomes, in fact, our veil of ignorance about the external, material world: if this is so, then, in our explanation of knowledge and awareness, a reference to the external world would seem to be dispensible.

The other argument of Dharmakīrti leads to almost the same conclusion. If the awareness of blue and the awareness of that awareness of blue are necessarily arising together, and hence are ultimately indistinguishable, there is no way by which we can claim that the blue (the blue-form) in awareness is (or even corresponds to) a reality separate from the awareness itself.[19] The causal theorists can be easily faulted and hence an idealistic explanation of knowledge and awareness will win the day. The philosophic motivation of Nyāya behind its thesis T_4 is to deny this possibility at the very beginning. T_4 is consistent with commonsense because it is possible for me to say that this baby is aware of the red flower before him, but he is hardly aware that he is aware. Why does T_4 initially seem so odd? The answer is that we tend to confuse the first-person statements (which are necessarily true) with the third-person statements (which are only possible, that is only sometimes true). I cannot say that I am aware without my being aware that I am aware. But I can say of Mr. X that he is sometimes aware without being aware that he is aware. Then I can argue that what is true of Mr. X should be true of me, viz. that I could be aware without being aware that I am aware, although I cannot *say* that I am aware without being aware that I am aware. For *saying* it (a sort of *vyavahāra*, to use the Sanskrit term) presupposes my being aware of the awareness of it.

Udayana has added a further argument: our internal events such as pleasure and pain are necessarily perceived *inwardly* because they are irresistible (cf. *tivra-sawvegitayā*), but our awareness sometimes lacks this character of irresistibility. Hence it is not always *inwardly* (perceptually) recognized.[20]

4. NYāYA VIEW ABOUT KNOWING THAT ONE KNOWS

Nyāya differs from others in its theory about how we grasp the truth-hitting character of a piece of knowledge, i.e. the knowledge-hood of a knowledge. We grasp the truth, it may be said, when we know a piece of knowledge as knowledge, and not as a mere awareness. I may *inwardly* perceive an awareness in the next moment of its origin, but I need something more to grasp its truth-hitting character or its knowledge-hood. The Nyāya theory implies, in the first place, that I may know that I have an awareness without knowing that this awareness is true, i.e. a piece of knowledge. In fact,

if certain conditions obtain (or do not obtain, as the case may be), I may never know (or know) that this awareness of mine at moment t_1 was a piece of knowledge. Moreover, if I were falsely aware at t_1 it would never be revealed to me that this was a false awareness unless some other set of conditions obtains. On the other hand, the set of conditions that is fit to generate in actuality a cognitive awareness would generate it as either a *true* or an *untrue* (=*apramā*) one, for according to Nyāya, a cognitive event must be either true or untrue. An exception to this rule would be the case of a pure sensory awareness, a conception-free perception.

Vācaspati expounds the Nyāya view as follows.[21] First, we should distinguish the scriptural matters from mundane matters, for scriptures are different kinds of action-guide. Concentrating upon 'mundane' matters, we should notice the following. The 'mundane' matters of our acquaintance may be classified as those with which one has acquired familiarity (e.g. daily chores) and those with which one has not (cf. *anabhyāsadaśāpanna*). My familiarity with a cup of tea in the morning or that there is a cup of tea on the table belongs to the first case. My perception of an unfamiliar man approaching me would belong to the second type. Vācaspati says that, in both cases, the truth of my awareness is known to me by an inference but the nature of the inference varies substantially one from the other. In the second case, I know that my perception has been veridical (that I am not under illusion) because it leads to confirmatory behaviour (cf. *pravṛtti-sāmarthya*). For example, I can go and talk to the man; and his behaviour that follows, if confirmatory, would allow me to infer: this perception has been a case of knowledge, for it has led to confirmatory behaviours. This is rather a pragmatic solution of the problem within the context. We have to remember that commonsense dictates that knowing that we have a perception does not m any way guarantee that we have a veridical perception, and this is the strong point in favour of the sceptical arguments. Nyāya makes room for this common intuition, but proposes to resolve the issue as follows. A perceptual awareness, whose veridicality is in doubt or unestablished (cf. *sandigdha-prāmāṃyaka* or *agṛhīta-prāmānyaka*) is as good as a dubious cognitive awareness (cf. *saṃśaya*). But even a dubiety, Nyāya asserts, may prompt us to act, and such action can very well be crowned with success. In such cases, Nyāya says, we *infer* the knowledge-hood of the awareness on the basis of some, confirmatory behaviour as evidence. Behaviour, here, includes

activities. Vācaspati has said that our actions and awareness (belief?) are (causally) related in the following way:

> Action or propensity to act depends upon the awareness of the object (*artha*), not upon the *certain* determination of it; for intelligent people act even from a dubious cognitive awareness of the object. It is not that those who act even being certain that the means will bring about an end (e.g., farmers ploughing fields for future crops) do not entertain (occasional) doubt about the result that is yet to come.[22]

The point is that even if the knowledge that my present perception is veridical or yields knowledge comes later, my present perception, whose knowledgeyielding character (truth-hitting character) has not yet been determined, can initiate action or behaviour that may be confirmatory in the end. Udayana says: 'Everywhere, one tends to act, having considered that there is more to gain by acting, and that even if the result is not confirmatory, the loss is less (than gain)'[23] (I follow Vardhamāna's interpretation).

According to Vācaspati, in the cases mentioned above, when the matters are sufficiently 'familiar', another inference is used, to establish the truth of an awareness. Vācaspati calls it the '*tajjātīyatā*' inference. I shall call it 'inference from LIKENESS'. Briefly, it is this. Everytime that I am in the kitchen in the morning, I see a cup of tea on the table. In order to know that my perception that there is a cup of tea on the table is veridical in such cases, I do not always need confirmatory behaviour (I go and take it in my hand, drink it, etc). Rather I infer then and there *that* the perception that there is a cup of tea on the table is veridical (knowl edge-yielding), for it belongs to the same type, i.e. it is LIKE others, many others, I had had before. In such cases therefore, our action or tendency to act (or our behaviour) is prompted by a certainty about the object, for we already *know* that this perception is veridical. This explains our strong commonsense intuition that in many cases we act on the basis of a *dead* certainty about an object. This is admittedly an inference based upon a premise involving the rather intriguing notion of LIKBNESS. It says that if *A* and the likes of *A* have been proven before to have the property *K*, then if *A* is like *A* (in essential points), *X* has *K*.

Udayana discussed this intriguing notion of LIKENESS.[24] Briefly, the LIKENESS varies with each type of cognitive structure. Besides, one sort of LIKENESS would be emphasized in the case of perception, another in the case

of inference. Basically, the idea is this. On the first occasion, my awareness that 'there is a cup of tea on the table' (suppose on the first day) was no doubt a piece of knowledge, but I did not know immediately about its being a piece of knowledge until confirmatory behaviour proved it to be so. After some days however, I would start knowing its knowledge-hood immediately after I see the cup of tea, for I would instantly infer its knowledge-hood on the basis of its LIKENESS to my past veridical experience. The LIKENESS is also based, in this case, upon the identical structural content.

Just as most philosophers defend the commonsense assumption that '*a* is aware that *p*' virtually implies '*a* is aware that he is aware', most philosophers of both Western and Indian tradition would assert that knowledge of knowledge is virtually equivalent to knowledge *simpliciter*. However, the traditional philosophers used arguments based upon introspection to defend this thesis. Ryle has subjected this argument-from-introspection to severe criticism and thereby rejected the thesis. Nyāya, however, rejects the thesis on different grounds and propounds an alternative doctrine which may not be acceptable to a follower of Ryle.[25] Nyāya asserts that knowledge of knowledge is not virtually equivalent to knowledge *simpliciter*. Translated in terms of the episodic notion of knowledge, this would mean that what leads to the episode of knowledge in a person, *a*, is not identical with what leads to the episode of knowing that knowledge in *a*.

As we have noted in section 3, part of the apparent oddity in the Nyāya position can be explained away by contrasting the 'first person singular' statements with the 'third person singular' ones. The statement 'I know that *p* but I do not know that I know' is plainly absurd, but '*a* knows that *p* but he does not know that he knows' is not necessarily so. In fact, a follower of Nyāya would argue that the second statement is not at all absurd. This will simply mean that the set of immediate (causal) conditions that leads to the episode of *a*'s knowing that *p* is not identical with the set of conditions that leads to the episode of *a*'s knowing that he knows that *p*. Not only can the two episodes take place at different times, they can also have different causal precedents.

Udayana says that all of us have an inherent propensity in us to desire and look for knowledge (cf. *samutkaṭa-vāsanā*), but the fact is that a cognitive event only occasionally aruounts to knowledge (becomes a knowing event).[26] As a result, we frequently take (mistake) a false awareness to be a piece of knowledge. A man, for example, can take the appearance of a wandering monk and we would quickly (*jhaṭiti*) take him to be a monk; but we cannot

say that we *know* in such cases, unless we also know whether the appearance is faked or genuine, as the case may be. For a doubt as to whether or not the appearance was genuine would be overwhelming. In an 'unfamiliar' situation (*anabhyāsa-daśā*) of the above kind when a cognitive event arises and is also grasped (known), it is commonly felt that an overwhelming doubt as to whether tins cognition is genuine (i.e. a piece of knowledge) or not often arises within a very short period (say, in the second or third moment). This fact cannot be explained if we suppose that when a person knows that he is 'AWARE', he knows *ipso facto* that he 'KNOWS'. Moreover, we have to say that the person has already come to know about his awareness, i.e. that he is aware that *p*, if the said doubt as regards the knowledge-hood of the awareness is to be possible. For doubt regarding the qualifying characters, A-ness or B-ness, presupposes knowledge of the subject entity (*dharmin*). In other words, if somebody doubts whether an object is a camel or a kangaroo, he must have some acquaintance (at least a vague visual experience from a distance) with the object itself. Here the subject-entity is the awareness itself. Hence an awareness of this awareness-event is a prerequisite for the said doubt to arise.

The doubt regarding the knowledge-hood of an awareness *infects* what is grasped by the awareness itself. This doubt it to be removed by an inference to ascertain the knowledge-hood of the awareness concerned. In 'unfamiliar' situations, as we have already explained, the inference is based upon 'confirmatory' behaviour. In 'familiar' situations it is based upon 'LIKENESS' with other, already decided, knowledge-episodes, the second inference being very natural, automatic, and almost unconscious (it is not 'consciously' done unless, of course, we are sufficiently provoked). According to Nyāya, this fact misleads the opponent into the belief that if a person knows that he is aware that *p* then he also knows that he knows that *p*.

With such arguments, Nyāya supports the contention that knowledge of knowledge is neither equivalent to knowledge *simpliciter*, nor even to knowledge of the awareness event (which may, in fact, be knowledge). This seems to go against the new 'formal' proof offered by J. Hintikka in defence of the thesis that '*a* knows that' *virtually* implies '*a* knows that he knows that'. But I do not think that there is any conflict here as far as the 'formal' proof of Hintikka is concerned. Hintikka sharpens the notion of knowledge well enough and makes several assumptions in order to make his thesis almost irresistible. In fact, his basic assumption is the condition C.KK*, which is based upon the rule A.PKK*, and the equivalence of knowledge of

knowledge with knowledge *simpliciter* really turns on this assumption. But the infallibility of this rule may be disputed. Hintikka himself is quite aware of the problems involved here. He also requires, for his thesis to obtain, that the person referred to by *a* in '*a* knows that' knows that he is referred to by it.[27]

E.J. Lemmon once clearly rejected the thesis that '*a* knows that…' implies '*a* knows that he knows that…'. He said: ' …there is a clear sense in which it is untrue: there are many things people know without realizing that they know them.'[28] It is significant to realize that Lemmon disagreed with the Hintikka-type view even without developing a sense of knowing that may be identical with that of Nyāya. The upshot is that one cannot *deductively* prove that knowledge *simpliciter* is equivalent to knowledge of knowledge, unless one prefixes the notion of knowledge so as to make the thesis irresistible. And this is what Hintikka has apparently done. The insight from Lemmon's disagreement would be that, in some acceptable sense of knowing, very little of the kind of epistemic logic (that Hintikka envisioned) would be forthcoming.

This would be a good place to explain further the Nyāya notion of knowledge. Nyāya would say that *a* knows that *p*, provided:

1. *a* is aware that *p*,
2. proper (causal) conditions for generating a knowing event have obtained;
3. certain psychological conditions, e.g. dubiety, awareness of the opposite of *p*, etc. do not obtain; and
4. *p* is the case.

It now seems feasible to say that a subject, *a*, knows that p at time t_1, but he does not know that he knows that *p*. Notice that *a* does not have here the right to assert that he knows, even if all the four conditions are met. In other words, if he can assert that he knows, then Nyāya would say that he already knows that he knows. Even if *a* remembers later on that *p* was the case, Nyāya would say that *a* might have already known that he knew that *p*, although there is another possibility. It may be that *a* remembered simply the fact that *p*, not the fact that he knew that *p*; and from this fact of remembering that *p*, he now infers (i.e. knows) that his previous awareness was a piece of knowledge. The last event is an inferring, not a remembering.

In the light of the points mentioned above, some comments on Lemmon's example may be in order. Lemmon says that if he suddenly remembered an obscure fact about Persian history which he had learned as a child, it would be said that he knew this fact; but until he remembered it he did not know that he knew it. This is misleading. Lemmon is obviously against taking knowledge to be episodic ('current action' in his language), as Nyāya would like to have it. But in spite of this difference the following Nyāya observation is possible. Nyāya would say that it all depends upon what exactly Lemmon remembered. If he remembered simply that obscure fact about Persian history, then he is only warranted to assume that he knew it before. But if he remembered that he learned (knew) it in his Persian history class, as is often the case, then he would be warranted to assume, as we would be to assume about him, that he knew that he knew it (when he learned it). In fact, Lemmon's example is unfortunate from this point of view, for learning in a class is very often the case of knowing that one knows (in the Nyāya sense of the term). Thus unless one so defines knowledge as to make it analytically true that knowledge *simpliciter* implies knowledge of knowledge, it would always be possible to say of somebody that he knew that *p*, although he did not know at that moment that he knew that *p*. Thus the Nyāya thesis may very well be defended.

Our criticism of Hintikka here may appear to be too hasty. For, after all, Hintikka constructed a 'formal proof. But it is rather refreshing to note that we are not alone in rejecting the second part of the Hintikka thesis. Among the philosophers, A.C. Danto has very convincingly argued that the above part of Hintikka's theory (or that of Schopenhauer whom Hintikka cites as a predecessor in upholding it) is false, provided Hintikka by his use of the verb 'to know' intends to capture *usage*. In short, Danto points out, by using what he calls his 'style of *grosso-modo* proof', that the conjunction of '*a* knows that *p*' and '*a* does not know that *a* knows that p' is not inconsistent.[29]

The main argument of Danto is that '*a* knows that *a* knows that *p*' has a truth-condition in excess of the truth-conditions for '*a* knows that *p*', and 'in such a way that the full satisfaction of the truth condition of the former is satisfied'. It is thus possible to hold that the former could be false while the latter is true. Danto explains this point as follows: we can take the notion of 'understands the sentence *p*' as giving a truth-condition for 'knows that *p*'. Thus the former would require that a understands the sentence '*a* knows that *p*' while the latter simply that *a* understands the sentence *p*. Danto further comments: 'And surely it is possible to understand a great many things

without understanding what knowledge is, or what "knowing that" means.'[30] All this goes to support the Nyāya view against Hintikka and the Mīmāṃsakas of India. But we should also note that Danto does not contribute to episodic conception of knowledge as Nyāya does. And this might explain the fact that Danto reaches a conclusion similar to Nyāya against Hintikka through a slightly different route.

In the case of perceptual awareness and awareness derived from linguistic expressions (*śabda*), Nyāya clearly says that knowledge-hood of such awareness is established (known) by an inference based upon the evidence of either the 'confirmatory behaviour' or LIKENESS (according as it is an 'unfamiliar' or 'familiar' situation). But there seems to be a controversy among the Naiyāyikas, which most probably was initiated by Vācaspati, about how the knowledge-hood of this kind of inference as well as of the *inward* perception that caps an awareness is to be established. This will lead us to the next discussion.

5. INFERENCE, CONFIRMATION AND INTROSPECTION

There are many problems that arise in the context of the Nyāya view about knowledge of knowledge (that has been stated in the previous section). Naiyāyikas tried their best to resolve these problems and I shall deal with a few of them here. Several points must be understood when we try to formulate the Nyāya view (as Gaṅgeśa makes them clear).

(1) Doubt is infectious. If *a* entertains a doubt regarding the knowledgehood of his awareness that *p*, then *a*'s awareness becomes *infected* with doubt and this means that *a* cannot be sure whether *p*.

(2) Human action is not always prompted (i.e. caused) by knowledge. Thus *a* may act with regard to *p* even when he has simply an awareness that *p* (even when he cannot be sure).

(3) A person can be sure that *p*, only if he has a certitude (an awareness) that *p* and this awareness is *not* infected or overwhelmed with doubt as regards its falsehood. He does not always have to be sure by ascertaining the knowledge-hood of his awareness.

(4) One may say: if c_2 ascertains the knowledge-hood of c_1, we may need another c_3 to ascertain the knowledge-hood of c_2 and so on. This inifinite regress can be stopped in the following way. If c_2 ascertains the knowledge-hood of c_1, and no doubt about the falsehood of c_2 arises, there is no need to look for c_3, etc. to ascertain the knowledgehood or otherwise of c_2.

(5) Actions, behaviour, etc. are 'shaky' (cf. *sakampa*) when they are prompted by dubious awareness. They are 'unshaken' (*niṣkampa*) when prompted by a certitude about *p*. Such certitude may arise because either no doubt regarding the falsehood of the awareness has arisen; or when such doubts arose, they were removed on the basis of evidence.

(6) In sum, action in us is never produced by knowledge of knowledge. A person acts because he knows (not because he knows that he knows) or he is simply aware, or he is in doubt but wishes to benefit from doubt, etc. (cf. Pascal's wager).

All this would apply to perceptual knowledge and they can be applied (as Vācaspati and Udayana have shown) *mutatis mutandis* to scriptural knowledge.[31] Three further cases remain to be examined: (*a*) inferential knowledge, (*b*) knowledge of the 'result' (*phala*), that ensures confirmatory behaviour and (*c*) inward perceptual recognition.

First, let us deal with inference. The sceptic, who is fond of the infinite regress argument, might say: if some inference is supposed to impart knowledge of the knowledge-hood of an awareness, then we may need another inference to examine what the former inference is said to establish. Vācaspati answers this by saying that an inference properly made would be 'self-verifying' in nature. This cryptic statement of Vācaspati became a matter of controversy for the later Nyāya. According to Vācaspati, an inference is 'properly made' iff it is based upon a reason or an evidence (figuratively called 'inferential mark') that is *invariably* connected or concomitant with the property that is to be inferred (cf. *anumeyāvyabhicārilinga-samutthatvāt*). In other words, if invariable concomittance is guaranteed between *A* and *B*, then from *A* we infer *B*, and in this nothing can go wrong. If inference follows this 'logical' rule, it imparts indubitable knowledge (cf. *niṣkampam upapadyate jñānatn*). For,[32] 'The 'mark' is there (present), and the 'mark' cannot be present unless the 'marked' (the property to be inferred) is present.' It is not clear whether the point of Vācaspati is that a logical (argument-like) inference is valid *a priori*,

because the principle of such inference embodies a necessary truth. Perhaps this would be a *volte face* for a Naiyāyika. He says that any inference, whether it is of the kind (described above) that is based upon the logical 'mark' called confirmatory behaviour or upon a logical 'mark' about which all kinds of doubt regarding ks non-concomitance or deviation have been removed (cf. *nirasta-saniasta-vyabhicāra-śaṃkasya*)) would impart knowledge, and knowledge-hood of such inferential cognition cannot be doubted.

Vācaspati's expression 'self-verifying' (*svata eva pramāṃa*) would, of course, mean that the knowledge-hood of such inferential awareness (conclusion) would be known by the same set of conditions that would generate knowledge of that awareness itself. Since, according to Nyāya, each awareness is cognized by an *inward* perception, in this case also when the inferential awareness arisesran *inward* perception would grasp such an awareness as well as its knowledge-hood. In other words, what Vācaspati intends to say (as Vardhamāna explains) is: when I have inferred that *p* I *inwardly* perceive that I have inferred that*p*, and by the same token I inwardly perceive that this inferred awareness is a piece of knowledge.[33]

Udayana reformulates the matter as follows. In the case of inference, i.e. inferentialawareness, doubt may arise as regards its knowledge-hood in either of two ways. We may doubt the adequacy of the causal factors involved. Or we may doubt the knowledge-hood of the 'concluding' (resulting) awareness. Two relevant causal factors are involved: Knowledge of the concomitance (invariability) between *A* and *B*, and knowledge of the presence of *A* (in the case under consideration, i.e. in *pakṣa*) on the basis of which we infer *B*. Now if these two pieces of knowledge are established (known), Udayana says the first contingency, i.e. arising of the first kind of doubt, is removed.

The second contingency is removed as follows. The inferred conclusion is '*B* is there'. The relevant doubt would be of the form: whether this awareness is a piece of knowledge or not. This would, according to Nyāya, *infect* the conclusion and the awareness would then be virtually equivalent to a doubt of the form, 'perhaps *B* is there, or perhaps not.' But this latter doubt is, according to Nyāya theory, what actually initiates the process of inference. (It is technically called *pakṣatā*.) In other words, people infer generally in order to remove such a doubt; and hence when inference has taken place (i.e. an awareness '*B* is there' has arisen) the said doubt would have been removed alr eady. Therefore, both types of doubt are removed in this way. Hence when the *inward* perception takes place to grasp the inferential awareness (i.e.

when I know that I have inferred that *B* is there), it grasps also, in the absence of any possible doubt, the knowledge-hood of the said awareness. This means that we do not need a further inference in order to know the knowledge-hood of the inferred conclusion (awareness). (And this may be a good answer to a Nāgārjunian sceptic who talks about a vicious circle or an infinite regress.)

This position of Vācaspati does not admittedly fit well with the rest of the Nyāya system. But I do not think it is entirely unsatisfactory. We should notice that the so-called 'self-verifying' character of an inference is not essentially the same as it is in the rival (Mīmāṃsā) schools. The Mīmāṃsā school seems to assume that knowledge-hood is the *natural* trait of an awareness-event (only 'faulty' causal factors give rise to the cases of 'faulty' awareness, falsehoods); and hence when the awareness is known its knowledge-hood is also *necessarily* known along with it. For Vācaspati, however, the knowledge-hood of the inferential awareness is known only contingently along with the knowing (*inward* perception) of the awareness itself. It is insisted upon, for example, that this happens only when all the possible doubts are removed. Udayana has shown how such possible doubts can be removed (see above). Further, inference is not said to be indubitable here on *a priori* grounds: what is appealed to is only a *practical* impossibility (cf. 'Contradiction of Practice' = *vyāghāta*) of raising any doubt.

Vardhamāna adds that the *inward* mental perception that grasps the inference B is there' grasps it also *as* an inference. Since 'inference' means an awareness derived from sound evidence or reason, our *inward* perception grasps the awareness as one derived from a *logical* evidence. In Nyāya theory of inference, what is derived from a *logical* evidence (*sallinga*) can never go wrong. As Vardhamāna insists: 'For, an inference produced by the 'consideration' of a (logically) sound evidence is never false or a pseudo-inference.'[32] If this is correct, then our knowledge of our own awareness as an inference would automatically be knowledge of its soundness, i.e. its knowledge-hood. This implies that the Nyāya theory of inference is computational and the mechanism of inference can never deliver *false* inference as output. The output could be a false awareness (a pseudo-inference) if only the input (the "consideration" of evidence) is false. If the input (the premise or premises) is not false but the conclusion is not really *entailed* by it, the Nyāya mechanism for inference would not generate any output, any inferential awareness. For it would reject the input and say, as it were, 'it does not compute'. In other words, while in the Western tradition one can draw a *fallacious* conclusion from some premise (and hence we talk

about 'logical fallacies' in such cases), one cannot INFER, in the Nyāya sense of the term, using such a premise as one's input or initial awareness.

In spite of the above explanations by Udayana and Vardhamāna, later Naiyayikas never felt happy about such a view of Vācaspati. To be sure, while one can agree with the point that inference, properly made, is *always* true and hence a piece of knowledge (in other words, truth would arguably be its omnitemporal, if not its necessary, character), one cannot see why it would *not* be possible sometimes to raise doubts as regards the truth or knowledge-hood of some particular inference. Gaṅgeśa, Vardhamāna *et al.*, think that such doubts can be entertained, and when they arise in us a further inference is needed to resolve them. Hence Vācaspati's expression *svata* eva is actually interpreted to mean 'with ease' (*sukara eva* in Vardhamāna). Vācaspati's cryptic comment would then mean, according to Gaṅgeśa, the knowledge-hood of an inferential awareness is easily grasped. And this means that doubts as regards its falsehood are *generally* absent and hence there is *unshaken* activity after inference.

Vardhamāna suggests another alternative explanation. The 'self-verifying' nature does not apply to all types of inference, but only to the inference by which we infer the character of knowledge-hood in any other awareness. Hence the inference based upon confirmatory knowledge or LIKENESS would be knowledge, and knowledge-hood of such inference would be known as soon as that inferential awareness itself is known (by an *inward* mental perception). The ground would be almost the same as before: all doubts as regards this particular type of inference going wrong are removed and hence further doubt should not arise.[35]

This leads to the second case: confirmatory behaviour. Jayanta directs his attention to the notion of 'confirmatory behaviour' that is used as the 'logical' mark to infer knowledge-hood of some awareness. He refers to the interpretation of some previous teacher or teachers (cf. *ācāryaiḥ*), who say that confirmatory behaviour means another awareness that ensues upon the first or an awareness of the logical evidence to confirm the first awareness. The idea is that if I see a man approaching and later on shake hands with him, this second awareness of mine confirms the first. Or, the shaking of hands would be the logical mark, my awareness of which (cf. *viśeṣa-darśana*) will establish that he is a man, which in turn would show that my perception was veridical. However, Jayanta rightly rejects such interpretations and says that Vātsyāyana, who originated the notion of confirmatory behaviour in the first sentence of the *Nyāya-bhāṣya,* meant by it a sort of confirmatory knowledge

or confirmation by virtue of the 'effects' or 'result' expected of the object known (cf. *arthakriyākhya-phalajñānam*). My perception that it is water there would be known to be veridical if it, for example, quenches my thirst. Awareness of the latter fact would be called *phalajñāna*, confirmatory knowledge, or knowledge of the 'result'.

The question now arises about how we know the knowledge-hood of the confirmatory knowledge, according to the Nyāya scheme. Here Jayanta differs from Vācaspati in resolving the issue. Vācaspati insists that cases of confirmatory knowledge are similar to that of 'familiar' situation, and hence an inference based upon LIKENESS is needed to know its knowledge-hood. Jayanta says that confirmatory knowledge does not stand in need of verification. It goes against the invariable practice of all persons to raise doubt about the knowledge-hood of the confirmatory knowledge. Jayanta almost claims that it is impossible to entertain a doubt here. For one thing, since my purpose has been served (cf. *siddha-prayojonatvāt*)s i.e. my thirst has been quenched, there is no necessity to examine or question the awareness any further. In other words, absence of any doubt accounts for the non-arising of the question whether it is a piece of knowledge or not. For Jayanta says: how can I doubt whether I have a knowledge of water or not when I am already in the middle of water—taking a bath, for example? But this is only a practical impossibility, not a logical one. For one can easily imagine that \t is all a dream, my thirst and the quenching of it, etc. Assuming this objection, Jayanta gives an argument that he himself repudiated in another connection. He says that the difference between dream experience and waking experience can be marked by our inward feeling (cf. *samvedyatvāt*). 'Here 1 am awake, not dreaming'— .an inner perception of this kind is concomitant with our waking experience.[36]

This, however, is a desperate attempt to get out of a tight corner. For Jayanta himself agreed (a few pages earlier) with the sceptic, as against the other Naiyāyikas and Mīmāṃsakas, that there cannot be any ostensible mark that we are necessarily aware of, when a perception arises, whether it is veridical or not. He challenged his opponent to spell out such specific mark as would unmistakably distinguish the veridical perception from the non-veridical one. For it cannot be clarity or vividness (*spaṣṭatā-viśeṣa*, probably mentioned by Dharmakīrti in otiq connection), nor can it be unshakable disposition to act (*niṣkampatā*; Vācaspati refers to it), nor absence of any doubt, nor perceived absence of any contradiction; for all of them would equally and indiscriminably characterize both an illusion and veridical

perception and, one may add, even a dream. Even if we concede Jayanta's point about dreaming and the presence of our 'inner' evidence in waking experience, it is quite possible to imagine a situation, following Vasubandhu, which is equivalent to that of a mass hypnosis, or a Cartesian situation imagined to be created by an evil demon, or the case of a 'brain in a vat' as imagined recently by Hilary Putnam, where 'inner' evidence will not be of any help.[37] Jayanta, however, tries an alternative way of establishing our knowledge of the knowledge-hood of the confirmatory knowledge. We become certain about the truth of the confirmatory knowledge only after a satisfactory examination of all its causal factors. This would, therefore, imply that confirmatory knowledge may need verification on occasion. I can examine, for example, whether my eyesight is defective or not, whether I am excessively hungry (and therefore hallucinating those sumptuous dishes), whether I am dreaming or awake, and so on.

The opponent might say that we can in the same way engage ourselves in examining the causal factors to determine the veridicalness of the first perception for which confirmation was needed. Why do we have to resort to such a method in the second, confirmatory knowledge, and not in the first one? Jayanta answers that this is also possible but generally people resort to examining the confirmatory evidence rather than examining the causal factorse of the first perception when it arises. If I see water, I immediately act to sec whether it quenches my thirst (provide41 am thirsty); and if it does, my first perception is confirmed to be a piece of knowledge. This is a much easier way than examining the causal factors of the first perception and people usually take the easier way out. To quote: 'Who would ignore the proximate and go for the distant object?' In sum, there is a practical solution to the sceptic's problems, but the super-sceptic can never probably be answered satisfactorily.

In confirmatory knowledge we, in fact, reach the end of the line. If the regress which the sceptic points out has to stop anywhere then it stops here. Mortiz Schlick has commented about the nature of confirmations (as Mohanty has already pointed out): 'They are an absolute end. In them the task of cognition at this point is fulfilled… it gives us a *joy* to reach them, even if we cannot *stand* upon them' (my emphasis).[38] Jayanta holds another view that coincides with that of the sceptic. He says that it is possible for all cases of our awareness to be considered as infected with doubt or uncertainty in the beginning, i.e. prior to confirmation, etc. For so long as the certainty about its knowledge-hood (or otherwise) has not arisen we can say that there

is a lack of certainty as regards the truth of my awareness, although an actual doubt has not arisen; and this lack of certainty transmits itself to the object of my awareness or 'infects' it. Hence there is a possibility of universal doubt in this extended sense of the term 'doubt'. Jayanta says that by 'doubt' here he would designate the lack of certainty which characterizes each awareness due to the lack of ourf knowledge about its truth.[39] The reason for conceding this position to the sceptic has already been explained. The Nyāya position that the knowledgeyielding character of an awareness cannot be known at the moment the awareness arises may entail such a possibility of universal doubt. We will initially lack certainty about the truth of any awareness. Jayanta says clearly that he is not arguing for the establishment of the possibility of universal doubt, but the Nyāya position might entail this possibility.[40] Each awareness, in other words, is suspect until proven not guilty.

Vācaspati, I have already noted, has a different view about the cases of confirmatory knowledge. He thinks that they should be treated in the same way as our perception of 'familiar matters' (*abhyāsadaśāpanna*) is treated. For they are after all 'familiar' through habit, repetition, practice, etc. Hence our knowledge of the truth of the confirmation is given by the inference (of the kind described before) based upon LIKENESS as the logical mark. Many times, for example, I drink water and thirst is quenched. Hence the 'instant' inference based upon LIKENESS gives the required knowledge that the confirmatory awareness of the quenching of thirst is true or is a piece of knowledge. The former confirmatory awareness only reinforces the latter. But it is possible to reach a point when I am drinking water for the first time to quench my thirst (before now, suppose I drank only coke);[41] in that case the inference based upon LIKENESS would not be available to me. Vācaspati anticipates this point and answers that in this case my tasting (drinking) of water belongs to the class of mundane objects or matters with which no 'familiarity' has been developed (*anabhyāsa-daśāpanna*). Therefore, here my action or tendency to act would (causally) follow from mere awareness which may even be a dubious one, but not from my *knowledge* that it is a piece of knowledge. When confirmatory behaviour follows, I become truly aware that I have a confirmatory knowledge. Vācaspati qualifies this statement by saying that such further confirmation of the initial confirmatory knowledge is needed only when we entertain a doubt about the veridicalness of the initial confirmatory awareness on the analogy of dreams, etc. The idea is that I might experience quenching of the thirst but still I may not be sure whether it

is not a dream, etc. for in dreams, etc. I can also have the same experience. When such a problem arises, I depend upon confirmatory behaviour to support my confirmatory knowledge (e.g. I may just examine whether the thirst is gone, wait for a few minutes, etc.).

Vācaspati, therefore, gets out of the dilemma posed by the sceptic as follows. The problem is this. In saying with Nyāya that an awareness is known to be knowledge by another knowledge—in fact, an inference—we may end up with either a vicious circle or an infinite regress. For even to make such an inference possible we need a knowledge of the logical 'mark', i.e. either a knowledge of what we have called LIKENESS or the confirmatory behaviour. Now the second knowledge may need further confirmation. In other words, we have to know its knowledge-hood to prevent the 'infection' of doubt. (A dubious awareness of the logical mark does not generate inference.) Vācaspati says in unmistakable language:

> The awareness of the logical mark LIKENESS, belonging to the first awareness, is a mental perception. Falsity of such mental perception is not (never?) to be found, and hence all doubts about its being wrong are completely (*parītaḥ*) removed. Therefore knowledge-hood of this (mental perception) is 'selfestablished'. Hence there is no infinite regress.[42]

Here 'self-established' is explained again by Vardhamāna as 'being known (established) by (another) *inward* (mental) perception, which grasps the first mental perception'. An awareness, say c_1, whose veracity is not known yet, certifies the knowledge-hood or veracity of another awareness, say c_2, provided no doubt has originated regarding the lack of veracity of c_1. If such a doubt arises, it infects the object of c_1, and thereby renders the veracity of c_2 dubious. In such cases we have to remove the initial doubt by the knowledge of c_0 which will certify the veracity of c_1, and it in its turn will certify the veracity of c_2. This need not lead to an infinite regress as long as we admit with Nyāya that a piece of knowledge does not have to be *known* first as a piece of knowledge for it to certify the veracity of another. The last in the series (backwards), c_0, can by itself do the job of certifying, and the cognizer may meanwhile move to a different subject and/or may not pause to question the veracity of c_0. This seems to be a better and pragmatic explanation of the Nyāya reply to the sceptical charge of infinite regress.

If Vācaspati is to be interpreted *literally*, then one has to say that he divides knowledges (knowing events) into two groups. There are those cases, whose knowledge-hood is established by a separate inference: external perceptions and knowledge from scriptures or linguistic expressions. There are others whose knowledge-hood is 'self-established' (i.e. established by whatever grasps the awareness itself): inference, *upamāna* (analogical identification), and mental perception. Udayana adds one more item to the second list: *dharmi-jñāna* (perceptual awareness, internal or external, of the entity that constitutes the subject-entity of a 'propositional' or constructive awareness), e.g. awareness of *a* which is a constituent of the awareness '*a* is *F*'. Udayana believes that the knowledge-hood of the awareness of *a* cannot be doubted in this case, for that would make the construction '*a* is *F*' practically impossible. In other words, if I am already aware that *a* is *F*, I must have already an awareness of *a*.

The prevailing Nyāya view, however, is that knowledge-hood of all knowing events *can* be established by an inference (of either kind described above), whenever it is possible to doubt whether the cognitive event concerned is a piece of knowledge or not. Udayana, therefore, offers the following compromise between Vācaspati's statement and that of other Naiyāyika's. When Vācaspati uses the expression 'self-established', he simply means that it is not the case that these are never self-established and this implies that these knowing events are *mostly* (though not always) self-established.

In other words, according to Udayana, Vācaspati's intention is to underline the undeniable fact that these knowing events are such that their knowledge-hood is *easily* (cf. *sukara eva*) established by the immediately succeeding mental perception of these events. This is so precisely because chances of doubt, as I have already rioted, are practically non-existent in these cases. But Udayana insists, it is quite (logically) possible that a person is in doubt as regards their knowledge-hood. In such remote cases, however, their knowledgehood can be established by another inference (cf. *parataḥ*). The supposed infinite regress can be stopped through practical considerations that we have already noted.

Another important point that we must note in this connection is this. Both Gahgesa and Udayana seem to allow that our mental *inward* perception of inner events, such as, cognition, pleasure, pain and desire, is *invariably* a piece of knowledge (cf. *prāmāṇya-niyatatvāt*, Gaṅgeśa), although we may

not *always* know its knowledge-hood automatically. To show this the following argument is suggested.

Let us suppose that a person, *a*, is aware that this is silver. This awareness may be true or false according as the object identified or referred to on that occasion by 'this' is a piece of silver or not. Next, he has an *inward* (mental) perception of this awareness in which he is aware that he is simply aware that this is silver. Since the second awareness grasps the first simply as an awareness (not as knowledge or illusion) nothing can possibly go wrong in it. The second awareness could have been wrong or false only if the first awareness were not, in fact, an awareness. But this is ruled out from the beginning. This point seems to be intuitively grasped when somebody says: 'How can I be wrong about my own feelings, intense pain, etc.?' Udayana says that our inner episodes are sometimes characterized by an intensity (*tlvra-saṃvegitā*) such that they force themselves into our consciousness, such as some intense pain. Some cognitive events (awareness) have this character of intensity, and hence there always arises a mental inward perception of them; and such perceptions can never be misperceptions. This would mean that, according to Nyāya, one cannot be deluded about one's being in pain etc.:

> Just as the knowledge-hood (of an awareness), with regard to "unfamiliar" situations, is ascertained (i.e., known) by confirmatory behaviour, the falsity (of an awareness) is ascertained by failure of such behaviour. Similarly, just as before the confirmatory behaviour ensues in "familiar" situations knowledge-hood is ascertained by LIKENESS, falsity (in such situations) is also ascertained (through LIKENESS).

A person suffering from eye-disease will see a double-moon repeatedly in the evening sky, and this will, therefore, be a case of 'familiar' situation. But he will still take it to be false on the basis of the LIKENESS inference. He will see that this cognition resembles in relevant respects other cases of false awareness (where falsity has already been determined). This is the general LIKENESS. He would also see that his cognition resembles, in essential details, his first awareness of the double moon (when his eye-disease started and when he ascertained its falsehood by asking others, etc.).

This shows that Nyāya is consistent in maintaining that a person may be aware that he is aware that *p*, but this is not enough for him to know whether *p* is true or not. Knowledge-hood and falsehood are properties of his (first)

awareness and he may remain unaware whether his awareness has such a property or not even when he is aware of his (first) awareness. Usually an inference (of either kind described above) helps us to establish the knowledge-hood as well as falsity. However, when an *inward* perception is grasped by another *inward* perception, Udayana says that its specific characters, *inwardness*, etc. are also grasped thereby. This is another way of saying that we grasp its knowledge-hood also by the same token. But if we still indulge in a doubt as regards its knowledge-hood, we have to fall back upon an inference to resolve it.[43]

THE INDIAN CONCEPTS OF KNOWLEDGE AND SELF

(Second instalment)

KALIDAS BHATTACHARYYA

The Nyāya-Vaiśeṣika doctrines that mental states are short-lived and that two or more such states cannot co-exist were examined in the last section. We arrived at the following conclusions:

(*i*) There is no possible denial of mental states as emergent and cessant. (*ii*) Their cessation is due to no foreign cause, they are self-destroying; and continuation is not incompatible with self-destruction. (*iii*) Co-existence of two or more mental states is not merely not impossible but often a fact.

In the next section we propose to examine in detail the Nyāya-Vaiśeṣika concept of *Object*.

Section III

The concept of object examined

A. *Nyāya-Vaiśeṣika concept of Object reiterated*

Nyāya-Vaiśeṣika has distinguished between object (*viṣaya*) and the real (padārtha). A real becomes an object when it is known; and as the content of sl *possible* (not actual) knowledge, it is a *possible* object. The real is that which as absolutely independent of my present knowledge has only been revealed by it. When it is so revealed (known) there occurs between it and the knowledge a relation which as belonging to the real is called its objectivity (viṣayatā), but as belonging at the same time to the knowledge it is subjectivity (*viṣayatā*) of that knowledge. Objectivity, unless it be only *possible*, is, in other words, an extrinsic relational property accruing to the real when it is known.[1] This concept of objectivity was elucidated in further details in Section I.

In that Section it was also shown that this objectivity is almost a tertiary property, in the sense that though it belongs to the real, and not, as objectivity, to the knowledge of the real, it yet, as a relational property[2], is constituted by that knowledge.

For a proper understanding of this two questions which were not raised in Section I need here be examined. They are (*i*) whether the relation cannot be extrinsic in the sense that it is not constituted by either term, and (*ii*) whether objectivity as a property (relational or not) may not be due to knowledge as an efficient (*nimitta*) cause, not constituted by it.

The reply to the first question would be this:

Relation may often be extrinsic in the sense indicated, but never so in certain cases, particularly where it is between knowledge and the real that is known. Between the world of knowledge and that of reals there is nothing that is not included in either. Hence the relation between an instance of knowledge and the real known must belong to one of these worlds. As a

matter of fact, it is found to belong to either alternatively: knowledge is *of the real* and the real is *known*. In the former case the relation belongs to knowledge, in the latter it belongs to the real. The relation between knowledge and the real is not, in other words, a simple affair like that between any two reals.

It may be asked if the dichotomy of the knowledge-world and the thing-world is metaphysically justified. Modern realists have questioned this, and we are told that Nyāya-vaiśeṣika also does not allow this. Is not knowledge knowm quite as much as other things?

Knowledge indeed is known like other things. Yet the knowledge that is known is knowledge *of a particular thing*. No other thing is necessarily *of another thing*. So far knowledge is fundamentally different from other things. Nyāya-Vaiśeṣika only insists that this type of thing is nevertheless revealed as an ordinary thing in another knowledge and, as so revealed, is an object. Knowledge, in other words, as necessarily *of a thing*, is necessarily subjective (*viṣayin*), and yet there is no metaphysical clash between this subjectivity and the objectivity (thinghood) of knowledge. Included in the sweeping world of things there are two entirely different types, viz., those which are necessarily subjective and those which are not so. The distinction between the two is more deep-seated than that between a tree and a blade of grass. Neither the tree nor that grass is necessarily subjective[1].

The second question was whether knowledge to which objectivity is due is not its *efficient* cause. Our reply is: it is not an efficient cause, it is constitutive. The reason is stated below:

Objectivity, though a property of the real known, is also the relation between that real and the knowledge. It is a relation of the real to that knowledge. As *of the real* it belongs to the real, but as a relation *to that knowledge* it is constituted by the knowledge. The real is here the locus (*anuyogin*) of the relation, and knowledge its constitutive determinant (*pratiyogin*). There is no mere relation, no relation that is without a constitutive determinant[2]. A further peculiarity of the determinant of a relation is that it is never a class, unless the relation is specifically of a thing to a class. Object, from this point of view, may then be defined as that real which has for a property a relation constitutively determined by the

knowledge of that real. The *real* here is not constituted by knowledge, because the relation in question is its extrinsic property. But objectivity and, therefore, object also are constituted by knowledge. 'Constituted by knowledge' may not mean that knowledge is an *upādāna kāraṇa*, but there is no denying the fact that objectivity is somehow constituted by knowledge.

The very concept of object as the real that has been known involves reference to knowledge. No effect, on the other hand, involves in the very concept of itself reference to its efficient cause. This also proves that knowledge is not efficient cause (but constitutive of object).

But though objectivity is constituted by knowledge this does not mean that the total knowledge-situation is to be interpreted idealistically. Objectivity belongs also to the real as its property, and this real is independent of the knowledge that reveals it. The reals as such are apprehended in non-judgmental perception (*nirvikalpa-pratyakṣa*)[1]. This, again, is not the only reason why Nyāya-Vaiśeṣika sides with realism. There is another reason more fundamental. The fundamental postulate of knowledge, Nyāya-Vaiśeṣika contends, is that whatever appears independent of knowledge is truly independent[2]. Objectivity, though constituted by knowledge, appears independent. Hence it is truly independent. The only way to reconcile this independence with its being constituted by knowledge is to hold that the independent is the real as such and objectivity as constituted by knowledge belongs nevertheless to this real.

The postulate is not dogmatic. It is capable of some sort of proof. If O appears independent of knowledge it is either really independent or not. But the negative alternative is untenable. If it were not really independent it was either the knowledge itself or constructed by it. But it cannot be either. To no corrective awareness is it ever felt that way. One cannot also insist that, whether felt or not, it is *inferred* that way. The apparent objectivity of O would go against that inference. No cognition ever appears independent of itself, and no cognitive construction appears independent of the cognition that constructs it. It cannot be said, again, that the independence is an illusion. The independence as such cannot be an illusion. There is no

illusory content which, or the like of which, was never presented as real[3]. Object, then, is independent of the knowledge of it.

This independence of object is the same thing as the fact that objectivity belongs to the real as a contingent property, which means that object being independent of knowledge does not clash with its being constituted by knowledge. Even if this were not the case, but object or objectivity were understood as itself independent of knowledge, even then there would be no great difficulty. To be constituted by knowledge would then, it is true, contradict the fact that it is independent of knowledge. But where a contradiction is forced upon us, and there is no way out,[1] it has to be submitted to. Such cases, however, ought not to be multiplied for the mere luxury of speculation.

In spite, then, of being constituted by knowledge, object or objectivity is real. But there is yet another difficulty to remove. Nyāya-Vaiśeṣika has classified reals into seven original groups. But object or objectivity appears to belong to none of them. Forms of objectivity, viz. *viśeṣyatā, prakāratā, etc.*, and therefore object also, are neither *dravya* nor *guṇa* nor *karma* nor *sāmānya, samavāya, viśeṣa* or *abhāva*. If they do not belong to any of these they ought not to be called real. This is the difficulty.

Nyāya-Vaiśeṣika has removed it in two ways[2]. Most objects and therefor also the forms of objectivity involved are the *svarūpa* of reals; and some objects, particularly those which are false, are only to be analysed into real constituents where the form of objectivity is not substantive-adjective *sāmānādhi-karaṇya*, but only *saṁsarga*. What is meant is that the total object of illusion is only a loose unity.

To explain. An object as the content of knowledge is always a complex unity. The elements of this unity are reals (*padārthas*) which as such are knowable in *nirvikalpa-pratyakṭa* only, and the relations that are added in *savikalpa* knowledge are, as seen, both knowledge-wise and reality-wise.[3] As reality-wise they are taken as real, and unless contradicted they are also really real. The elements and the relations are thus equally real. If the relations cannot be placed among the catalogued *padārthas*, this is because these relations, though real, are not *additional* realities. If a real A is really related to a real B, this does not necessarily mean that the relation is a *third* real entity. The Buddhists too have admitted this when they hold that

santāna which is as real as the *kṣaṇikas* is yet not other than these. Many Western thinkers also insist that relations, though really relating, are not other than relata.[1] All the difficulty arises when the reality of relation is misunderstood as its being a third entity. If it is not third, if, in other words, the real relation is exhausted in the catalogued *padārthas*, there remains no difficulty- in admitting its reality. Nyāya-Vaiśeṣika holds that the so-called additional relation we are aware of in *savikalpa-jñdna* has this status only. They are exhausted in, another name of which is that they are the svarūpa of, the *padārthas* they relate, not additional realities.

Not that all entities which we call *relation* are of this type. Inherence (*samavāya*) and contact (*sarhyoga*) are called relation and they are additional reals. Similaly when a fact or a series of facts which are normally treated as terms (as opposed to *relation*) act as relation (*e.g.*, between a father and a child) they, even as relation, are additional entities. The additionality of inherence and contact follow from the fact that they are matters of *nirvikalpa-pratyakṣa*, and that of the facts or the series is immediately evident. Where there is no such special reason or immediate evidence a relation need not be additional. A flower, its red colour and the inherence of the latter in the former are, according to Nyāya-Vaiśeṣika, separate reals; yet in the perceptual judgment (*savikalpa-pratyakṣa*) of the form 'this flower is red' where the inherence of the red colour in the flower stands as related to that flower and that colour, this second relation need not, because there is no special reason or immediate evidence, be a separate object. Not that it is therefore a subjective construction only. We have seen why, according to Nyāya-Vaiśeṣika, it has to be taken as real. It follows that such relations are real and yet not other than the reals they relate. Such relations are the *svarūpa* of the *padārthas* related.

The above is the account of the object of normal *savikalpa-pratyakṣa*. The account of the *false* object (assuming that falsity has been detected) is different. In erroneous *savikalpa-pratyakṣa* the total object is definitely known to be not real. Hence though, like the object of normal *savikalpa-pratyakṣa*, it too is broken up into real elements and a relation, can the relation be taken as the *svarūpa* of the elements, seeing that the total object *is not real*? Ordinarily we should say 'No'. But Nyāya-Vaiśeṣika prefers to stick to the claim that *vikalpa* relations are the *svarūpa* of the *padārthas* related. They stick to it, only because it has followed from the fundamental

postulate that whatever appears as independent is really independent. Object, everywhere, is to be analysed into the constituent reals and the *vikalpa* relations, which latter are everywhere exhausted in those reals. But how, then, could the total object be unreal here? Nyāya-Vaiśeṣika replies as follows:

The total object here is no olose unity. When the illusion is exposed the elements cannot be said to have been apprehended as related in the way of substantive-adjective identity (*sāmānādhikaraṇya*). The unity here is loose, it is of the form 'P is in S', not of the form 'S is P'; and such unity is only nominal, no genuine unity. This, in effect, means that when the illusion is exposed we cannot say there was any genuine close unity of S (*this*) and P (*snake*).

Not that 'P is in S' is never a close unity. Rather, normally it develops into that. 'P is in S' is easily translatable into 'P is *as in S*'='S is *with P*' whioh is a close unity. But such translation is sometimes impossible, particularly when it is known for certain that there is no real 'P as in S'. 'Horns are in the hare' cannot be translated into 'Horns are *as in the hare*'. While a denial of the former is intelligible it is impossible to deny the latter in the form 'Horns *as in hare* are not'. Every judgment, whether affirmative or negative, presupposes that at least the subject-term stands for a reality, but 'horns as in the hare' stands from the beginning as self-condemned. There is no such difficulty, on the other hand, in the judgment 'Horns in the hare are not'. This judgment is only a periphrasis of 'Horns are not in the hare' where the subject does not stand for a wholly nonexistent thing. If, now, denial here is intelligible in the only form 'Horns are not in the hare', the corresponding affirmative judgment cannot but be in the form 'Horns are in the hare', not 'Horns are *as in the hare*' The false object of an illusion corrected has also to be understood in this form. We cannot say 'This is snake' or 'The snake is *as in the locus*', we must say 'The snake is in the locus'. In the case of "hare's horn" or 'this snake' we are compelled to say this, only because stating the situation the other way about would stand self-condemned: we already know that "hare's horn" or 'this snake' is not real.

Denial of substantive-adjective identity does not, however, mean that there is no *vikalpa* relation here. Every *savikalpa-jñāna* must involve *vikalpa* relations that are also asserted as real. But here the *vikalpa* relation is anything but identity. It is *saṁsargat* meaning any relation but identity.

The 'in' in 'horns in the hare' or 'snake in the locus' is the *vikalpa* relation of *saṁsarga*. A distinction should be drawn between (a) *ghaṭo nīlaḥ*, (the pot is black), (b) *ghaṭe nīlaḥ*, (black colour is in the pot) and (c) *ghaṭo nīlatvavān* (the pot is with black colour). In (a) the *vikalpa* relation is substantive-adjective identity (*sāmānādhikaraṇya*). In (b) it is *saṁsarga*. In (c) it is more complicated: there is a turn back to *sāmānadhikaraṇya* through *saṁsarga*. Normally (b) and (c) coincide. But in cases like "hare's horn" or 'this snake' (b) fails to amount to (c). In the case (b) the content is peculiar. Though there is the *vikalpa* relation of *saṁsarga* the total object is not a close unity. A pure case of (b) is not indeed a normal occurrence. We have to recognise it only where we are already assured that there is no real total object, as in the case of error[1].

B. *Indian theory of object* vis a vis *Western theories*

In Nyāya-Vaiśeṣika, object (*viṣaya*) is neither wholly reducible to knowledge and its phases, and is so far real, nor wholly equated to reality (*paādrtha*), though it is the *svarūpa* of that. Object as the *real*-that-is-known is as much real as reality itself, and yet as the real-*that-is-known* it is not entirely that real also. Were it the real itself there would have been no occasion to distinguish between the real and the real-as-known. But, again, even as not entirely the real, it is also exhausted in, *i.e.*, the *svarupa* of the real. Also-objectivity, though not wholly reducible to knowledge and its phases, is yet constituted by knowledge, being unintelligible apart from the fact that the corresponding real is being known. Almost all Indian thinkers accept this view. Those who accept it differ only in further details. But most of the Western thinkers would reject it altogether. Western realists would never admit the intermediate *object*: they hold that knowledge is straight in relation with the real. Idealists and semi-idealists in the West would also, contrarily, deny object, reducing it to knowledge and its phases, and either reject the so-called real thing or admit it as never bodily knowable. A Berkeley would deny the real altogether, and a Kant or a Hegel would go the second way about.

In defence of the intermediate *object* Indian thinkers would argue as follows:

Awareness of a real is either judgmental (*savikalpa*) or pre-judgmental (*nirvikalpa*). When it is savikalpa certain relations—forms,of judgment—creep in. What is the status of these forms? Are they modes (or functions) of knowledge, or are they real, or both? On the first alternative, realism, at least with regard to the content of *savikalpa* knowledge, is gone. On the third alternative there would indeed be a type of realism, but it would be more Indian than Western. The second alternative would only add difficulties. Are hypothetical and disjunctive forms and forms of inference real in the realistic sense? They evidently involve subjective experiment; and so the contents of hypothetical and disjunctive judgments, and also of inference, embody the experiment: the resulting propositions and the conclusion are in the form 'if—then—', 'either—or—' and 'therefore—'. Attempts to get rid of such embodiment of the experiment have always looked forced. The reduction of the hypothetical proposition to the categorical may be a piece of skilful translation work, but no hypothetical proposition ever means a categorical fact only. It follows that the reduction of the disjunctive proposition to the categorical is equally a faliure, for such reduction is possible through another reduction, viz., of the disjunctive to the hypothetical. It is doubtful, again, if even the latter reduction is complete and natural. Even if a disjunctive proposition can be analysed into two or four (or whatever be the number) hypothetical propositions we must not forget that the disjunctive proposition is the *unity* of those hypothetical, that unity being its specific characteristic. The attempt to get rid of the "therefore" in inference would also be equally abortive, that "therefore" being the very characteristic feature of inference. There is indeed something like "because— therefore "in the hypothetical proposition also; but it is only *like* that. In "because-therefore" the antecedent stands asserted. But it is not so asserted in "if-then.", unless "if-then" be only an apologetic softening of "because-therefore".

What, now, is true of these judgments and inference is true equally of categorical judgments, affirmative or negative. Negation may or may not be real, but it is no good denying that the negative judgment involves subjective experiment. There is such experiment so far at least as the *possibility* (*yogyatā*) of the negatum being related to its locus is concerned.

The experiment is also embodied in the content, though not so obvertly as before. In hypothetical and disjunctive judgments, and also in inference, the embodiment was evident in the forms of "if-then", "either-or" and "because-therefore"; but *possibility* which is an embodiment of subjective experiment is not stated explicitly in a negative judgment. Yet if the negatum were not understood as a possible real relatable to the locus, there would be no negative judgment at all. "S is not P" necessarily implies, though this implication does not come up to the surface, that *a possible reality P relatable to S* does not stand so related to it. Though negation, whether by way of identity or that of *saṁsarga*, may be a reality the form of the negative judgment—which form is also inevitably asserted of the content—is not a reality in the realistic sense.

As regards affirmative judgment, one type of-it, *viz.*, the universal, cannot have a form that can pass unchallenged as realistically real. Like negation, the universal also may or may not be real as the realist understands it; but in the universal judgment we do not merely assert a universal related to another universal. In the judgment "All men are mortal" we inevitably assert all individual men also (taken in denotation) as related to either mortality or mortal beings. How, now, are all individual men apprehended here? We do not apprehend every man with his particular features, we apprehend him as only a case of the universal humanity. Individual men are, in other words, known *through our knowledge of that universal*. This need not be the *sāmānyalakṣaṇapratyakṣa* of the Naiyayikas. We may not perceive all individual men. Still somehow in the universal judgment we speak about all individual men, and this is possible if only we apprehend all men through our knowledge of the universal humanity. A subjective experiment is thus involved, and the experiment is embodied in the form "all". "All X's" cannot be a purely realistic fact. The Russellian idea of such "all" as an open class is unacceptable. In the judgment "All men are mortal" we do not mean that A, B, C, D,……..*and so on* are mortal. There is no sense of privation here. It does not mean that the men whom you and I have seen *and those whom we have not seen* are mortal. This would be unduly apologetic. What is *positively* meant is that all individual men are mortal. We mean, in other words, a closed class, as much closed and positive as any group of enumerable things, the only difference between the two being that while the number in the latter is finite

that in the former is infinite (not negative infinite, but positive). Russell could at all interpret "all" in his way because he was predisposed to denying the connotative universal. His interpretation would have been legitimate were he able to account for the total meaning of "all" without having recourse to the connotative universal. But in the interest of economy he sacrificed at least an important part of the total meaning. We mean by "all" a positively infinite number of individuals. Such an "all" is not an absurdity as a Russellian would have us believe. A closed class of a positively infinite number of individuals is intelligible if understood through (the presupposed knowledge of) the corresponding connotative universal. Whether or not that connotative universal is itself also meant by "all" is not the point here. It is enough that at least the positively infinite number of individuals are meant.

Likewise the simple categorical form "this S is P" cannot also be taken as real in the realistic sense. In such judgments the predicate as almost always universal is to be understood, in the way of a universal subject, as somehow referring to all individuals, and therefore through a corresponding universal. Where the predicate is not a universal, or supposing that a universal need not be understood in denotation, there is still another reason—and that is more primary— why the form "this S is P" cannot be real in the realistic sense. The relation meant by the copula "is" embodies a subjective experiment, though only covertly. The relation meant is neither inherence nor contact nor any that is a *padārtha* in the Nyāya-Vaiśeṣika sense. It is one that relates S, P and that *padārtha*-relation into a unitary object, and is, therefore a *vikalpa*. This *vikalpa* is not consciously felt as experiment. But it must be one such. We have already proved that every vikalpa is knowledge-wise, though not for that reason merely subjective. This knowledgewise-ness is no other than the fact that a mode of knowledge is embodied in the content. Over and above S, P and the *padārtha*-relation a second relation which as unifying the three has to be admitted cannot be real in the realistic sense.[1]

C. *Some clarifications—*

There are two questions which should be answered at this stage. It may be asked if this relation also does not require another relation, and so on ad

infinitum. It may also be asked if the original *padārtha*-relation does at all require the second relation.

To the first question the reply is in the negative. The second relation was required only to relate into a unity three items of reality one of which happened to be a relation. Before that unification there were only three items. But now that they stand unified through the second relation which is a *vikalpa*, there is no task left to relate this second relation again to the three items by further relations.

The reply to the second question is in the affirmative. The first original relation was not sufficient to have formed the unity that is meant by the judgment "This S is P". Often it is no genuine relation, but only a quality or even a substantive—indeed, anything whatever—which is somehow taken as intermediate between S and P. As such it cannot by itself relate S and P and (itself also) into a unity. When a so-called relation is a reality of this kind another relation which is genuinely a relation is requisitioned to do that work. But whatever else there is in the world of reals, this genuine relation is not there till that S, P and the so-called relation stand unified in knowledge. "Unified in knowledge", we repeat, does not preclude the possibility that they stand unified in the world of reals also. The unsophisticated mind takes them as also forming a real unity, for such is the plain realistic import of the judgment.

The fact that S, P and their so-called relation are unified in knowledge and that yet the unity formed is real may be understood in three ways of which one only is tenable. It may mean that S, P and the so-called relation only *appear* to be really related. Secondly, it may mean that they had been standing as already really related before I had the *savikalpa* knowledge, but that this real unity comes to be revealed only with that savikalpa knowledge, almost in the same way in which Vaiśeṣika understands *sāmānya*. Or, thirdly, it may mean that they were not standing as really unified, but become related and unified just when I know them in the *savikalpa* way. Of these, the first alternative is rejected on the plain ground .that no appearance can be dismissed as mere appearance or false unless there is a reason, and no such reason is forthcoming here. So long as there is nothing to the contrary a situation is really as it appears. It cannot be argued that there is a reason here for the dismissal, viz., that the genuine vikalpa relation has come to be known as a mode of *knowledge*. For we cannot

overlook the other side, *viz.*, that it is also asserted as real. To show merely that something is A does not prove that its appearance as B is unreal. For that another step is necessary. Either we must point to a clear defect (*doṣa*)[1] in that appearance or at least its being A is to be a matter of inference, it being presumed for the present that inference is a stronger *pramāṇa* than perception. But here the *vikalpa* relation to be a mode of knowledge is not a matter of inference. It is true the knowledgewise-ness of the *vikalpa* relation is not always evident; but for one who has perceived that *because-therefore, either-or, if-then, A as not B and all A* are knowledge-wise it is not difficult to perceive that even the simple categorical form is also a mode of knowledge, particularly when it is realised that S, P and their so-called relation cannot unify themselves. Knowledgewise-ness of the categorical form does not merely follow from the impossiblity of unification, it comes also to be immediately realised. There is, again, no specifiable defect in our awareness (which is quite primary) that the genuine relation is fact. Hence the dimissal of it as sheer appearance or false would be unjustified.

Even if the knowledgewise-ness of the categorical *vikalpa* were merely a matter of inference, there is no reason why inference here should be preferred to the immediate knowledge that the *vikalpa* is real. Inference is preferred to immediate knowledge either when it not merely contradicts but definitely sublates (why, we may not say) the content of immediate knowledge, or when it is followed by the perception of a defect in that immediate knowledge, or when our point of view is that of *prāmāṇya*, not of primary assertion which is present as much in inference as in perception. In the present case the inferred knowledgewise-ness of the *vikalpa* does nothing of the sort, and the point of view is *ex-hypothesi* not of *prāmāṇya*.

Inference is sometimes regarded as a stronger *pramāṇa* on the ground that it is supported by many cognitions that are involved in it. But the point of view of corroboration is that of *prāmāṇya*, not of primary assertion. The *prāmāṇya* of a cognition may be extrinsic to that cognition as primary assertion, in which case it is doubtful if *prāmāṇya* has any metaphysical import.[1] Or it may be intrinsic in which case the entire problem of *prāmāṇya* is a little more than explication. Either way the attitude of *prāmāṇya* is not very relevant to primary assertion. It would be useless to argue that when a cognition is confirmed from the point of view of *prāmāṇya* chances of its possible rejection are eliminated. Mere elimination

of possible errors does not make a cognition valid unless it were already so taken, though amidst a mass of confusions.[2]

A particular cognition can also be dismissed as erroneous if it is succeeded by one which is its contradictory, the idea being that a cognition is the assertion of a genuine reality till it comes to be contradicted, and that the later contradictory cognition has not yet been contradicted. *Uttarajñānapkṣapāta* belongs, in this sense, to the very constitution of knowledge. But in the present case there is a strange phenomenon. The knowledge that the *vikalpa* relation is a mode of knowledge may be later than the assertion of that relation as real, yet when that later knowledge occurs the prior one is not sublated. Both continue with unabated primacy.

The reality of this relation, then, cannot be false or sheer appearance.

The second alternative mentioned in page 36 above, *viz.*, that S, P and their so-oalled relation had already formed a unity and is only revealed in *savikalpajñãna*, has also to be rejected. The unity could not have been formed by the so-called relation, and a fresh relation which alone could form it could not have been there before the *savikalpajñāna*, because, as already shown, it is knowledge-wise. It has also been shown that the simple categorical form, quite as much as other forms of proposition, embody subjective experiment.

Hence the third alternative alone is left. The *vikalpa* relation and the unity occur as real only when S, P and their so-called relation are known in the *savikalpa* way. This does not mean that the *savikalpajñāna* as an efficient cause has produced something in the reals concerned. What is meant is that the propositional form, though knowledge-wise, comes to be asserted as involved in those reals. Though knowledge-wise, it comes to bo asserted as real also; and as this is not self-contradictory, it can be taken as really real.[1]

But is not a real independent of the knowledge of it, and does this not imply that it existed before that knowledge occurred? If something appears real only so long as it is known, is it not for that very reason called unreal?

The answer depends on what is meant by the word "reality". If it means 'that which exists and is independent of the knowledge of it', the *vikalpa* relation and the unity are real, because even though they are constituted by

knowledge they are yet asserted as existent and independent of knowledge, and we have seen how to be constituted by knowledge does not clash with this other character. It follows that to have remained prior to knowledge is not necessary for something to be real. Many reals may be so prior, but some need not be.[2]

Or, it may be said that the *vikalpa* and the unity had remained prior to knowledge, but as so prior they were not *existent*. Like subsistent values they had only been *demanding* existence, but were not actually existent. They come to exist only when they are known. As subsistent, *vikalpa* relations remain in their self-contained aloofness, and relate S, P and their so-called relation only when these latter come to be known, and through that knowledge. It is because they yet maintain their Platonic ideality that they refuse to be wholly identified with that knowledge and proclaim themselves as prior to that knowledge; and it is because they now stand as relating, and therefore adjectival to, the actually real S, P and their so-called relation that they in that function come to be known as actually existent. This is more or less the Kantian view of *vikalpas*. Whichever interpretation is accepted we have to admit grades of metaphysical status. In the first interpretation there would be two kinds of reality, one co-tomporal with knowledge and the other transcending its duration; and as this distinction concerns the very existence, not the content, it is a distinction of metaphysical status. The distinction between subsistence (*demand* for existence) and actual existence is obviously a distinction of metaphysical status.[3]

D. *An aspect of Logical Positivism examined*

The Indian position has been vindicated. It has been shown that over and above reality, though not necessarily separate from it, object has to be admitted. This has been established through an analysis of the metaphysical import of thought-forms. The only conceivable way to get rid of this intermediate entity would be to deny that forms of thought have any metaphysical import. Logical Positivists have attempted this in their systematic campaign against thought. They consider forms of thought as *either* only means to analytical interpretation, the Whole interpretation

being only linguistic, *or* vicarious, misrepresenting a olever language-construction as pointing to a reality.

But it is difficult to see why thought should be so unceremoniously guillotined. Mass hysteria is no logical justification. These Positivists ought to have seen that no judgment, not even the simple categorical, is either a mere analytical representation of a non-judgmental content—what to speak of non-perceptual judgments which are obviously not so?—or, because of the extra element involved in it, vicarious, for we all believe that the total content of the judgment is real exactly in the form in which it appears in the judgment. We have already seen that in spite of being knowledge-wise the extra element is nevertheless felt as real and that the two aspects do not ,clash. These Positivists have never explained why among the devils of judgment some, *viz.*, a good number of perceptual judgments, are obedient slaves. We can understand Kant who has excluded a very limited number of judgments, and that on definite grounds. But these Positivists have started with a bias. They have indeed shown extra-ordinary skill in translating non-perceptual judgments into the language of simple perception. But translation always falls short of the original: the original vitality is always missed and there is only vicarious compensation.

Perceptual judgments do not merely analytically represent contents of simple perception. In simple perception there is a bare plurality of S, P and a so-called relation between them, all appearing either discrete or non-distinguished. But the judgment "This S is P" means that S and P, and sometimes their so-called relation also, are distinguished and yet related into a unity.

We have said that in simple perception S, P and their so-called relation are either discrete or non-distinguished. The former is the Nyāya-Vaiśeṣika view according to which simple perception (*nirvikalpa-pratyakṣa*) is certified not by introspection but by inference, and the simple elements that are inferred as constituting a substantive-adjective complex perceived have to be inferred as discrete. But one is not compelled to accept the Nyāya-Vaiśeṣika view that simple perception has only to be inferred. One might hold that it is an introspectable stage. In this other view the simple constituents are not found as discrete, but in a sense non-distinguished. Let us explain, how.

If there is any psychological stage, called non-judgmental perception, it is of the form SP (this blue pot—*nīlaghaṭaḥ*) which differs from "this S is P" in that while in the latter S and P are both distinguished and related, the relation standing as a distinct entity, we do not find this phenomenon in the simple SP. Not that SP is therefore an amorphous homogeneity, as Bradley would have it. If there is at all a psychological stage having the simple content SP, we are aware, at that very stage, of S and P also, the three contents—S, P and SP— alternating indeterminately, each, at the time it is apprehended, standing as absolute. When we are aware of S there is no question of either P or SP, and similarly with P; and when we are aware of SP it is not apprehended as the unity of S and P, but as much an absolute entity as that S or P. A whole, in simple perception, is never known as a whole *of parts*. For that apprehension the parts and the whole require to be related in a judgmental form of awareness. The very words "part" and "whole" are relevant in a judgment context only. If A, B and C are three absolute entities, C is a whole, and A and B are parts, *only when* between C, on the one hand, and A and B, on the other, a certain relation of dependence is asserted, when, *e.g.*, it is known that while A and B are dissociable from C, C is not so dissociable from A and B; and such knowledge cannot bo simple perception. Similarly with regard to any other unity. A universal or a substance, *e.g.*, is felt as dissociable from the relevant particulars or attributes, but not the latter from the former. In simple perception, then, S, P and SP are each absolute, and there is no question of a relation between them. But in the judgment "This S is P" S and P (and it may be, their so-called relation also) are related in a specifiable way in the unity SP. The indeterminate alternation of several absolutes is thus, in simple categorical judgment, replaced by determinate relation.

In simple perception S, P and SP are each absolute. SP is not a unity, but as much an absolute entity as S or P. It may indeed be asked—Do not S and P stand involved in SP? How otherwise could it be known as SP? The reply is that in simple perception it is not known as SP, but merely as an absolute entity with a differential quality perceived. It is only retrospectively called SP, called that way from the point of view of the latter *judgment* "S is P." But, it may be asked again, is not that SP known, at least in this retrospective manner, as identical with the unity known in the judgment "S is P"? We reply—Yes, there is only as much unity as between object and reality.

We thus find that even simple perception is not so simple as Logical Positivists believe. It too involves an extra element, the as yet undefined differential quality. The logical form of the simple categorical judgment may be understood as linguistic definition of this quality. But it is not like definitions elsewhere. In other cases of definitions there is no line, except in the verbal presentation, between the definitum and the definition. Here there is such a line. Yet, however, the linguistic form is asserted as real without any sense of inconsistency. We have also seen that there is no contradiction in a thought (language)-construction here being real.[1]

E. *Concept of relation reviewed*

It may be asked—if in the world of reals there are inherence (*samavāya*), contact (*saṇyoga*), *etc.*, are they not genuine relations relating S and P into a unity, even apart from my knowing them?

The answer should be prefaced by a more fundamental problem to be raised here and solved. If at a non-judgmental stage we can at all apprehend[1] S, P and SP which are real, is there at that stage any *object* over and above those reals? The problem, in other words, is if even in non-judgmental perception there is the intermediate entity called *object*?

We reply—There is. If the reals here are S, P and SP, the object is *these in indeterminate alternation*. In *savikalpajñāna* there are definite *vikalpa* relations binding reals into unities, but here in the place of those definite *vikalpas* there is only indeterminate alternation, and therefore also an indeterminate unity through that alternation. The unity that is effected by alternation is always indeterminate, as is evident in the case of disjunctive judgment. Here, however, in the present case, the alternation itself is indeterminate, and hence the unity effected is unlike one in disjunctive judgment. The unity here is not judgmental: the stage in question is below even simple categorical judgment. But there is still a unity, though at the vanishing point; and the vanishing unity is here the object. The object here is more coincident with reals than in *savikalpajñāna*. The object and the real here are not *definitely* distinguishable.

It may still be asked if even at this stage the real SP is not apprehended as different from S and P, and, if so, whether the distinction can be anything

but that this SP is a unity of S and P. The unity may be indeterminate, but is it not a unity still? If so, has not the unity been effected by some elements in the region. of reals, *viz.*, inherence, contact, *etc.*? A But, again, if such unification through inherence, contact, *etc.*, is possible, why was it said before that these are only *so-called* relations, not relations that unify and, therefore, relate reals? With this we come to the question asked at the beginning of this sub-section.

The answer is that indeterminate unity is qualitatively different from one that is determinate. Indeterminate unity of S and P is little more than their alternation, as we find even in disjunction. When, again, the alternation itself is indeterminate, even SP which is the indeterminate unity of S and P alternates with that S and P. This latter means that though the difference between SP, on the one hand, and S and P, on the other, is now a little more defined the situation still remains indefinite. Indeterminate unity at the non-judgmental level, then, means either that S and P are only alternating with one another or that SP comes to stand with just a differential quality, not further defined. Even where S and P merely alternate they stand each with a differential quality, and the quality is such that though it distinguishes S-with-that-emergent-quality from simple S, and P-with-that-emergent-quality from simple P, it is apprehended as somehow also the *same* in both. This vague sameness or identity of the differential quality, as appearing to transcend,on account of this identity, S and P comes to be represented as some sort of unity in the vague form of SP even here.

The unities effected by inherence and contact, and the latter as relations, are to be understood in this light. When S and P in *contact* effect SP what is apprehended at the non-judgmental level is (i) that S and P have each a differential quality which is, only retrospectively from the point of view of a later *savikalpajñāna*, represented as S-in-contact-with-P or P-in-contact-with-S, and (ii) that somehow the contact is also felt as numerically one and the same, so that we also say that S and P *are in contact*, the result being SP. The selfidentical contact as standing between S and P is never apprehended as an explicit definite real, what is explicitly felt being only the indeterminate alternation of S-with-that-differential-quality and P-with-that-differential-quality. That this indeterminate alternation is at all felt, however vaguely, as the self-identical contact between S and P is no more than an incipient interpretation of the alternation in terms of *savikalpajñāna*

(judgment). Judgment is so much a normal mode of knowing that even when we are aware that there is a nonjudgmental mode, we, in spite of all caution, involuntarily smuggle its form, though now in disguise, into the non-judgmental content. Contact is really a differential quality of each term, the contact of P with S being different from and alternating with the contact of S with P. Indian thinkers have always taken contact as qualities of S and P alternating.

Contact includes a host of relations. Parts of a whole, *e.g.*, are in contact with one another: the spatial relation of the parts with one another is, in other words, nothing but a form of contact[1]. The spatial relations of up-down, right-left, *etc.*, are in many cases forms of contact, with, of course, additional differential qualities at the level of non-judgmental perception. The additional differential quality is only retrospectively definable in terms of *dik*. Often, again, this differential quality alone is found, when, *e.g.*, S and P are not in contact. As with spatial relations, so with corresponding temporal relations. Often, again, the contact is with the very principles of space and time. Into further niceties wo need not enter.

A host of other relations are represented by *inherence*. The relation, *e.g.*, between a whole and a part, a universal and a particular, a quality and a substance, is inherence. But at the non-judgmental level it is not apprehended as a definite relation relating S and P. At that level it is only a differential quality of SP. SP no doubt alternates with S and P, but stands evident with that differential quality. The differential quality is only retrospectively specifiable as the fact that from the total situation SP either S or P is dissociable and the other not. At the non-judgmental level there is only a vague sense of this dissociability. A whole or a universal or a substance is only vaguely felt as dissociable from the total situation, and the parts, particulars or qualities are vaguely felt as undissociable. The total situation SP is felt with this differential quality.[1]

Some Western thinkers and the Buddhists have missed the differential quality corresponding to what is called inherence and have accordingly denied the reality of the whole, the universal and the substance. Some of them have committed a further mistake of missing the reality-aspect of *vikalpa* relations, and this has led them to deny all reality to relations and unities. But, as is evident now, both these are exaggeration. The Buddhist position will be examined later.

F. *Object-reality distinction evident in correction of illusion*

The distinction between object and the real will also be evident from an analysis of illusion as corrected. Before correction the content of illusion is felt as real object. But after correction it stands as an object *minus* the reality-aspect, so that to the end it is still an object, though of a peculiar type, unconnected, or better, disconnected, with reality. This disconnection is not a normal feature of objects. But the illusory content is an abornal object, and because illusion is cancelled we are forced to admit such disconnection.

Some believe that the corrected content as over and above reality is no object but subjective. Vijñānavādi Buddhists in India and many thinkers in the West have held this view. The Vijñānavādin's view will be examined later. They have offered arguments, and these will be examined in due course. But the Western thinkers who have passed this as almost self-evident have only confused different issues. That appearance is distinct from reality is one issue, and whether what is distinct from reality is subjective or not is another issue. The distinctness of appearance from reality is no sufficient reason that it is subjective. Further, these Western thinkers have misunderstood object as wholly identified with the real, and have naturally been driven to the conclusion that what is not real is, on that very account, not object, and is therefore subjective. But we have seen that object is neither unqualifiedly real nor unqualifiedly subjective (knowledge-wise).

There is another point to be considered in connection with the thesis that in correction of illusion we realise object as over and above reality. The object here is not necessarily the content of *savikatpa-pratyakṣa*. It includes the content of *nirvikalpa-pratyakṣa* as well, supposing there is such a stage evident to introspection. The thesis, in effect, means that though in normal perception[2]— judgmental or non-judgmental—object, in spite of being knowledge-wise, is found coincident with the real, it is apprehended as loosened when a perception comes to be corrected. We have seen that in non-perceptual knowledge *vikalpas* and, therefore, objects are clearly felt as knowledge-wise (experimental), though not for that reason denied reality. But this knowledgewise-ness, we have also seen, is not so manifest in

savikalpa-perception, far less in nirvikalpa; object in these two cases is not clearly felt as distinct from the real. Our present thesis is that the distinction of the perceptual object—a determinate unity or an indeterminate whole—from the real stands exposed in correction. By implication it is admitted that even non-judgmental simple perception (*nirvikalpa-pratyakṣa*) can be erroeous.

We are often told, particularly by Western thinkers, that in non-judgmental simple perception there is no question of falsity, all question of truth or falsity arising only when knowledge is judgmental (*savikalpa*). This is untenable. If the content of non-judgmental perception be S, P and SP alternating, with a differential quality of either S and P or SP, there is no reason why this content should not be as much true or false as the content of judgment: all the difference between the two kinds of knowledge is that while in the latter there is explicit relation there is only a differential quality (or qualities) in the former. There is a kind of vague predication (unification), in the form of differential quality, in non-judgmental perception also. Further, it is difficult to see why truth or falsity should concern predication only. May not a simple content, not known as related with another be true or false? When it is apprehended is it not asserted as real, and may not such assertion come in certain cases to be sublated later?

The whole question as to whether the content of non-judgmental perception can or cannot be true or false depends on what is meant by the word "truth" or "falsity". If "truth" means that the content of knowledge *exists*, there is truth claim in non-judgmental perception, for it too is asserted, *i.e.*, taken as existent. Similarly if "falsity" means that the once-asserted existence of the content is now disbelieved—disbelief being not necessarily judgmental, but at least in some cases the awareness of a differential quality of the content—there is nothing against a non-judgmental cognition being false.

An analysis of the very concept of judgmental rejection would corroborate this. Judgmental rejection=rejective judgment may be perceptive or nonperceptive—in Indian terminology, *savikalpa-pratyakṣa* and *savikalpaparokṣajñāna*. Where it is perceptive there is in the content *perceived* a differential qulity corresponding to the *vikālpa* relation of contradiction, over and above that contradiction itself. It is only when the rejective judgment is non-perceptive (*parokṣa*) that there is no question of

that differential quality, and rejection in such cases is either through a categorical or hypothetical inference or through testimony. Thus even perceptual rejective *judgment* is intelligible through a perceived differential quality, corresponding to the relation of contradiction, in the content rejected (though there is in the content the explicit relation of contradiction also). If so, the differential quality is, at least in some cases, a sufficient ground for the rejection of the content. Why, then, may not the content of non-judgmental cognition be also rejected, when in it too a similar differential quality comes to be perceived?

Truth, however, and therefore falsity also, may mean something else. Truth may mean that the existence of the content is *explicitly* asserted, as in the judgment "SP *exists*", and such assertion is always the *confirmation* of a prior knowledge of the content. Truth, in this sense, is but the confirmedness of that prior cognition, so that the existence of the content has come to be specifically pointed to. Falsity would, from this point of view, be the *untenability* of the prior cognition and, therefore, the explicit rejection of the content. This is the problem of *prāmāṇya* in Indian philosophy, not always clearly distinguished in the West from the simple assertion of the existence or non-existence of a content.

If truth and falsity are understood from this reflective point of view it would be admissible indeed that only judgments can be true or false. But there should be a note of caution at the same time that this is not true of all judgments, so that judgmentality is no *sine qua non* of truth and falsity. Existential judgments and judgments of modality alone can be true or false —judgments, namely, where existence or its near equivalent is stated as the explicit predioate. In other judgments there is no such explicit statement. In the judgment 'S is P,' for example, the copula 'is' represents more an explicit *vikalpa* relation than explicit existence of the content SP. That it appears to stand equally for both is an accident of English language. In Sanskrit we find that '*ghaṭo nīlḥ*), is a sufficient expression, and the statement '*ghaṭo nīlo* bhavati' is not required. There is logical ground also. Even in English language the existential import can be explicitly distinguished, as in the judgment 'SP *exists*'; and it is plain logic that if something can be distinguished it, where not distinguished, remains implicit and subordinate. The copula in 'S is P' thus only implicitly and

subordinately conveys the existence of SP. Obvertly it represents a relation only between S and P.

If it be insisted that after all the existential import is still present, though not explicitly, in the judgment 'S is P,' we reply that it is equally present in non-judgmental perception also. As much in the latter as in the former the total content is known as existent. It has sometimes been urged that even judgments like 'S is P,' as distinguished from the non-judgmental awareness of SP, is against a doubt or challenge that S might not be P, so that as so against the doubt or the challenge it is more reflective than the non-judgmental awareness of SP and, therefore, asserts so far the existence of the content explicitly. But this would be a wrong understanding of the actual situation. 'S is P' is certainly more reflective than SP, and perhaps non-judgmental awareness is not reflective at all. But the reflectiveness of the former does not lie in its being against a doubt or challenge. Here there is neither an actual nor a possible doubt (or challenge). That there is no actual doubt can hardly be questioned. There is no possible doubt too; for a possible one is no more than that which I in judging that way only anticipate, and it is a fact that I did not anticipate one. Had I anticipated, the judgment would have been of the form 'S is P,' with an emphasis on the existential import; and such judgments would be hardly distinguishable from the existential, The simple judgment 'S is P' is reflective in the sense that it is against the background of a half-distinguished *assumption* of the abstract content 'S as P.' This 'S as P' as half-distinguished is no other than the unity-through-*vikalpa*-relation considered apart from its reality aspect.

Sometimes, again, a third reason is offered why only judgment, and not non-judgmental awareness, can be true or false. It is said that as only judgment involves a sort of spontaneity, either because *vikalpa* relations are considered as *acts* or because a constructed general idea is appended to the subject, the question of the truth of the judgmental knowledge naturally crops up. But this, again, is both a too simple and a uselessly complicated account. Too simple, because whether *vikalpas* be acts or not, and whether a general idea be a construction or not, there is also the undeniable fact that every judgment asserts the reality of the total content. To foreget this aspect and to insist on the *vikalpa* relations being subjective would be over-simplification. There is also unnecessary complication in that the *vikalpas* are taken as *acts* or, even by some, as forms of will, and general ideas are

taken as mere constructions, whereas the peculiar character of judgment is intelligible even in the absence of any such theory.

So there is no reason why judgments alone should be true or false, and nonjudgmental knowledge outside this disinction. Both equally are true or false, if 'truth' means that the content is known as existent, and 'falsity' that it is rejected. Only when truth is understood as the confirmedness of a cognition as against an actual or a possible challenge, and falsity as the corresponding rejection, can ordinary judgments and non-judgmental knowledge be taken as outside the distinction of truth and falsity. But as here we are not using the words 'truth' and 'falsity' in that sense we hold that all cognition can be true or false.

With this we come back to the problem of the exact status of the illusory content, whether in judgment or in non-judgmental knowledge.

G. *Buddhist theory of ātmakhyāti examined*

Before an illusion is corrected the total content is taken as a real object. But after correction it is known as definitely not real and, therefore, to have been an object *minus* the reality-aspect. This is what is meant by *rejection* of the illusory content. It would be too much to claim, as some Buddhists have done, that even its objectivity is rejected. If they intend that both objectivity and reality are denied this would be unnecessary duplication. Rejection of any one of the two aspects is enough; so the other aspect has to be retained. It is enough for correction that the reality-aspect is rejected; hence objectivity ought to be retained. But why may it not be interpreted the other way about? May it not be said that the aspect of objectivity is rejected and the reality-aspect retained? The Buddhists under consideration have, as a matter of fact, offered this interpretation. But this would only make the confusion worse confounded. If the content is real and yet not an object, it would be real as only a mode of knowledge. But does the corrective judgment assert this *subjective reality*? Do we find that the illusory snake was not an object but an existent subjective idea[1]?

Correction is either judgmental or non-judgmental. When judgmental, it is of the form 'this is not snake' coupled in a mysterious manner with another form, viz., 'this is rope'. The content 'this as not snake' is a unity,

effected through a *vikalpa* relation, of a real this and either a real snake (when the vikalpa relation is negative) or the absence of snake. The content 'this as rope' is also a real unity of a real *this* and a real rope. In either ease there is no escape from the *this*-element which is no subjective idea.

The Buddhists in question have held that the content of correction[2] is 'not this, but snake'. But even if this be allowed there is the other content 'this is rope' inseparably connected with it. In that other content *this*-element is asserted as existent, and it is also evident that this *this* is somehow non-different from the *this* in 'not this, but snake'. It is impossible that in the same correction the same *this* is both assorted as existent and rejected. That in the content 'this is rope' it is assarted as existent is beyond question. It follows that 'not this, but snake' is a mis-representation of the other content. That other content is either 'this, not snake' or 'this and snake, but no predicational identity of the two' or 'this and snake, but the two not consciously distinguished', *etc.*, all of which are representable as 'this is not snake'. The Buddhist theory of *ātmakhyāti* cannot pass unchallenged.

Even if we allow the form 'not this, but snake', it does not follow that the snake-aspect is subjective. That would presuppose that 'this' means *to be now outside me*. But 'this' does not mean that. Even an *idea* which no one can call outside is a *this* to me if it is now. Tho concept 'this' is highly intriguing and involves either *now* or *here* which are equally intriguing. To interpret it as 'to be now outside me' would only be too facile.

The Vijñānavādin may argue that *snake* would still be subjective even if the content of correction were 'this, not snake'. 'Not snake' means that the snake is rejected, and the rejected snake as ousted, on the one hand, from the world of reals and as yet not zero, on the other hand, cannot but be subjective. But this too would be a hasty conclusion. In spite of being false, the snake appeared as object. A theory of error which can retain this objectivity is to be preferred to one which denies it too easily; and considering what has been said so far about the distinction of object from reality, the presumption is against the idealistic theory of the Buddhists.

Correction may also be non-judgmental. But even there, as in all nonjudgmental knowledge, the content is a presented rope with the peculiar flavour of a denied presented snake, or an absent snake with the preculiar flavour of its having been nevertheless presented, or a once-presented snake

with the flavour of its being ousted by a now-presented rope, the once-presentedness of the snake being, of course, no more than a fringe round the flavour of being ousted. Whichever way the content appears, there is no scope for the particular Buddhist theory, In every case the content is presented as an *object*.

The rejected snake can in no way be taken as subjectively real. Indeed the phrase 'subjectively real' is often a camouflage. In what sense is a subjective idea real? Is it real in the sense of being independent of its knowledge, or is it real in the sense of being just existent?

The Buddhists under consideration hold that in correction the outsideness only of the content is denied, and its reality is retained. But is the subjective reality of the snake its original pre-correction reality? The pre-correction reality of the snake included its having been independent of the knowledge of it, whatever else it might have included. But at least that independence is now denied by these Buddhists. The subjective snake is then real in some other sense.

The reality of subjectivity is qualitatively different from that of a nonsubjective content. While the reality of a non-subjective content is distinguishable from that content this is not the case, at least according to the Buddhists in question, with the subjective. The subjective, at least according to them, is self-evident: to be subjective is *ipso-facto* to be real. In 'this flower exists' existence can be imagined as dissociable, as at least a universal *belonging to* this flower, or even as what may lapse. But in 'I am' am-ness is the same thing as I-ness. I=I am. Contrariwise, the *content* of the non-subjective is imaginable apart from existence (or non-existence), but not so the content of the subjective. If the subjective can at all be imagined apart from existence, there is no conceivable way of adding that existence ever to the content. The subjective is either ever a mere content or ever with existence. Whichever way it is understood, it is evident that the reality of the subjective, if at all it is real, is qualitatively different from that of the non-subjective. To say, therefore, that the snake is subjectively real is little more than saying that it is just subjective. The reality with which we contrast the false is the reality of the non-subjective. And yet these Buddhists persuade themselves that in correction the reality of the snake has been retained, as though it is the same reality which we had before correction.

It is true that there is a natural tendency to take what is not real (in the realistic sense) as. merely my imagination and, so far, subjective. But there is no assurance till now that the image, though subjective, does not stand outside. The false snake, detected as false, may have been a subjective image. But I saw it outside, and it is not yet certain whether this outsideness came to be cancelled. It might well be that its reality (existence) alone is cancelled, the snake being understood as a ghostly outside entity, a floating adjective, as it were, of the rope that is real. An image to stand outside is not *prima facie* absurd. In every normal perception where the content is presentative-representative the representative element, though imaginal, stands outside, tied to what is merely presented. If this be allowed, why may not an image, in illusion, stand outside, though unconnected or misconnected with what is presented? That which in normal perception made the image an outside content is not the correctness of the perception, but only there being to that perception a presented content. In illusion too there is a presented content, and so there is no reason why it cannot be outside. The presented content is not, it is true, evident in its full character. But there is no denying the fact that there is a presented content. The represented content, again, is not a real adjective of the presented element. Nevertheless it is an adjective, though false, false in the sense of being really unconnected or misconnected. Alike in normal perception and illusion the image-element is outside. Imagination may be directed to a past thing or a given presentation, or to no thing whatever. When directed to a past thing, the insideness of the image is more evident than its outsideness. The *thing* no doubt is remembered, but as imagination has added nothing to the thing-as-it-was-perceived no special outsideness of the image is evident. What is evident on the other hand is that there are new laws, relations and characteristics of the imagination. As directed to a given presentation, however, the outsideness alone of the image is evident: the image stands tied, it is said, to the presentation. The insideness of the image here has only to be inferred, and it remains ever doubtful if here the dispositions have matured at all into a subjective image. The same thing occurs in illusion; Only, here the image is freely or wrongly associated with the given presentation. Where, lastly, the image is not directed to anything—past or present—it is ever on the" vanishing point and is kept steady, even as so vanishing, by words. In this case—we may call it idea, as distinct from the two previous types of image— it stands evident as merely inside. The

outsideness of the image is complete in the- second case only. The complete outsideness in the second case and the much less outsideness in the first are equally due to the reference of the imagination to real things outside. The Buddhists under consideration have been deluded by the theoretical insideness of the image. They have not seen that except in the third pase above there is also its outsideness, evident in its fulness as much in perception as presentative-representative as in illusion.

The idealistic account of the false content is thus untenable. The false content has to be taken as non-subjective, t.e., an object, though it may not be a real object. All other Indian theories of error and the modern realistic theories of Alexander and other realists agree in this point.

In spite of this general agreement, however, they differ in some fundamentals, each having understood the concepts of object, reality and their relation in a different way. These theories should be examined separately.

H. *Some modern realistic theories of error examined*

Some modern realists believe that an object as such is neither real nor unreal and that the reality of a normal object and the unreality of one called illusory are equally unmetaphysical, being only contingent derivative characters.

But this is over-simplication in various ways. Let us see, how.

(1) An object that is rejected may be provisionally granted as subsisting on its own account and having unreality as a contingent derivative character. But the object of a normal cognition[1] is never felt as subsiting aloof from reality. It is felt from the beginning to the end as absolutely coincident with the real—in other words, as unqualifiedly real. It is only where there is no assertion, where a content is *merely entertained* that one may say it subsists. But such content is in the face of it an abstraction, and actually felt that way. Even doubt, question and suggestion are more or less assertive. In doubt and question there is still assertion, though it is either midway between or alternation of affirmation and denial, or the assertion

here is vague and incomplete. It cannot be said that in doubt and question there is neither affirmation nor denial. Suggestion also is not without all assertion. Suggestion is the mere entertainment of a content-as-asserted. In all other types of cognition, except in error corrected, there is unambiguous affirmation or denial, though in the affirmation of one content there may remain involved (and subordinated) the denial of another content, and *vice versa*. In such cases the content is not felt as dissociated from reality. It would be useless to argue that the fact that the same content can be asserted, suggested, questioned, doubted, merely entertained or even rejected is enough to make one feel that it is at least dissociable, if not dissociate, from reality. The content that is simply entertained is abstract and symbolic, but a content asserted is felt neither as that abstract one *plus* its assertedness nor as symbolic *plus* something else. No concrete can be broken up adequately into (several abstract features or) an abstract feature *and* a dark solid base. A cow is not analysable into cowhood and an indenifite solid base; that base is itself also a particular *cow*. Had not the base had a definite *svarūpa* the universal cowhood could not be connected with it to the preference of any other particular, say, one to which doghood or horsehood belongs. The content asserted is, again, real, and no reality is constituted by a bare symbolic possibility *and* something else. Possibility may at the most be the essence of the real, but even then the real is, a *modification* of that possiblity, so that between a real and a corresponding possible there is nothing that is explicitly common. If Y be a modification of X, it is X in another form, not X *and* another form, far less, therefore X and a dark ground. The relation of an asserted content C to a C that is merely entertained is true *mutadis mutandis* of its relation to C's that are doubted, questioned and suggested. To all these attitudes there is never the self-same content except in name, and even that *name* C is not the content of simple entertainment. Only the content of correction is absolutely the same as what was asserted. But of that later.

The realists under consideration might still argue that as we ourselves have shown through all these pages that object is different from the real we ought not to take exception to their view. Should not object as distinct from the real be taken as neither existent nor non-existent[1]?

We reply, we hold *also* that object is yet felt as coincident with the real, *i.e.*, as itself the real. We have also shown that there is no reason why one of

these two apprehensions is to be preferred and the other rejected. To have preferred their distinction to the extent of rejecting their identity has been the over-simplification No. I of which these realists are guilty[2]. There are other acts of over-simplification also.

(2) They have understood the illusory content too hastily. True, when error is corrected we come to doubt if the content was definitely either existent or nonexistent. But this 'not definitely either existent or non-existent' does not; amount to 'neither existent nor non-existent'.

There is no evidence yet, nor even a reasonable suggestion, that it was definitely neither. The only case where there is definite absence of either is simple? entertainment where the content is admittedly abstract; but the content of error, even after correction, does not appear to be abstract. No one feels that the content of error should be taken as having been merely supposed or simply entertained. It need not be denied that the content is not felt as definitely either existent or non-existent, but that does not mean that it is definitely neither. It is, still *asserted*, though neither as existent nor as non-existent.

The content corrected is still asserted in the sense that it is known as a sort of appearance *of the real* that is discovered in correction. After correction it is not felt as floating in the air. It is felt even then as somehow tagged to the real, not a self-subsistent content having nothing to do with the real. The question of unreality of that content at all arises only because there is such tagging: this appearance of the real is not a real appearance.

(3) These modern realists are guilty of yet another over-simplification. By treating object as such as neither real nor unreal and interpreting reality and unreality as equally pragmatic or linguistic or anything else they have missed a notable feature of the *unreal* object. In whatever way reality is interpreted, unreality is not co-ordinate with it. The unreal is that which was once apprehended as real. If it were not understood as 'once apprehended as real, but now rejected,' even abstract contents (including even the *neutral contents* of these realists) would have to be called unreal.

The central problem of error is how a content can be both objective and unreal. If the denial of objectivity, as by the Vijñānavādi Buddhist, has been too easy, so has been the attempt to treat reality and unreality as only extrinsic to the content.

I. *Nyāya-Vaiśeṣika theory of error*

The illusory content as both object and unreal could not be a problem at all if object in normal perception were not wholly coincident with the real. Object to be so coincident with the real is not merely what just happens when a perception is not erroneous. It follows, we have seen, from a fundamental postulate of knowledge, at least of perception[1]. The problem, then, is this:—How can the same object be real and unreal at the same time?

The problem can be formulated in another way. In course of examining the modern realistic theory of error we have shown that the content rejected is, even after correction, *asserted*, though neither definitely as existent nor definitely as non-existent. It is asserted, in other words, as a queer type of appearance of the Teal. How can the rejected content be yet an appearance of the real? A can be taken as an appearance of B if between them there runs a bond of identity. But how can there be a bond of identity between the false and the real when the false is definitely rejected as unreal?

Nyāya-Vaiśeṣika solves the problem characteristically in close touch with objective common sense. It holds that though prior to correction there was the awareness of a total object 'this snake' or 'this is snake,' correction of it entails that this awareness was wrong, another name of which is that the total content is unreal. Yet, however, the awareness of it was *savikalpa-pratyakṣa*, which implies that some reals (apprehended in *nirvikalpa-pratyakṣa*[2]) were related into a unity by *vikalpas* which are knowledge-wise. The reals in the present case were *this* and *snake*, for nothing else could be related into the unity 'this is snake.' The *this* here was but the real rope perceived as mere *this*. Its rope-*svarūpa*[1] was not perceived on account of certain defects in the percipient or outside. We perceived, in other words, just a given substratum, no *svarūpa* of it. The other real was *snake*, but not *this snake* or *that snake*. Not *this snake*, because there was no snake presented. Nor, again, *that snake, i.e.*, a snake of the past remembered in relative fullness as the snake there and then, for *that snake* could not be combined with a *this* substratum. What could be so combined is just *snake* (*sarpamātra*). Some past snake is no doubt remembered, for otherwise there could not be a question of snake at all; but it is not remebered as *that* snake. Only the snake-*svarūpa* is remebered. As any past snake is real, so is also the snake-*svarūpa* (*sarpamātra*) which is only a part of it. This snake-

svarūpa came to be combined with a *this* into the *savikalpa* unity 'this is snake' through a peculiar psychological mechanism, viz., that the very memory of the snake-*svarūpa*[2] acted as the contact between the sense and the real substratum. This psychological mechanism does not concern us for the present.

The elements *this* and *snake*[3] are real. The *vikalpa* relation that combined them into a unity is also real; this follows from the fundamental postulate of knowledge already mentioned. But unlike the elements and the *vikalpa* relation, the unity formed *is not* real. In correction this unity stands rejected. This last is the intriguing feature of illusion. Normally when the elements and the *vikalpa* relation are real the unity effected stands also as real. The present case is an exception, only because the unity has been rejected in correction. Not that I was not aware of the unity before correction, nor that as an object *then* it was not apprehended as real. But correction contradicts just this prior awareness and therefore sublates this object. It follows that once it is sublated it cannot be taken to have been real even before.

But if it cannot be said to have been real, how can we say that it was yet an object? Does not the reality of every object follow from the very fundamental postulate of knowledge? The Nyāya-Vaiśeṣika reply is that it cannot be said to have been an object even. It was indeed felt as an object, but as a matter of fact it was not an object[4]. Not that it was therefore wholly subjective. This idealistic theory has been already refuted. Moreover, if the elements are real outside their unity cannot be merely subjective. It cannot be said, again, that though the elements are real by themselves they yet *as in the unity* must partake of the nature of that unity. Here there is no question of the elements *in the unity*: in the unity there are no elements, there is only the unity, and nothing else, the elements being only inferred as having been apprehended in a prior *nirvikalpa* knowledge.

The unity in question is neither merely subjective nor an object coincident with the real. Not that as neither subjective nor such object it is the neutral object of the modern realists. Such neutral objects we have already dismissed. Nyāya-Vaiśeṣika is forced to conclude that after correction there is no talk of such unitary object. Though prior to correction some such unity appeared, correction is just its sublation. What is meant is this:

After correction we cannot say 'This snake is (was) not'. Such negative judgment is impossible. Every judgment, affirmative or negative, is possible if at least the subject is already known as real. 'A table is not in the room' presupposes that there is a table in the world (though not in the room). But before we are entitled to say '*This snake* is not' we are already assured that *this snake* has been sublated. So there is no occasion to use 'this snake' as the subject of a judgment. It will be no use arguing that though the present *this snake* is sublated there were other *this-snakes* at other times. 'This' refers primarily to one unique particular, one that is presented just here and now, and in comparison with it the use of the word 'this' as characterising other things which were so presented is abstract and symbolic, not a genuine living use. Whatever else may be called *this*, the primary and living use of the word is regarding a very unique particular entity. *This* snake is the very particular unique snake that was here taken as a real object and is now sublated in correction. 'This snake', so understood, cannot be the subject of a judgment, affirmative or negative. The negation of *this* snake, so understood, would be a case of *aprasaktapratiṣedha*.

If *this snake* cannot be denied now, it cannot also be taken, from the point of view of correction, as what was affirmed before correction. From the point of view of correction, then, *this snake* was not an object.[1]

But do we not yet, even from the point of view of correction, say '*This snake* was not' or '*This snake* was apprehended as object', and do we not mean something by that? Nyāya-Vaiśeṣika would claim that this is an unjustified use of language. We do certainly mean something, we mean that *this snake* is sublated. But sublation is not adequately representable in the form of a negative judgment. Sublation may include, imply or entail a negative judgment, but it is more than that. Even the negative judgment that is included, implied or entailed is not of the form. '*this snake* is not', it is of the form 'no snake is here (in *this*), where the subject is not *aprasakta*.

It follows[2] that the unity effected out of *this* and *snake* through a *vikalpa*-relation is not 'this is snake' or 'this snake', but 'snake is in this' or 'snake in this', not even 'snake *as in this*' (for in the statement '*snake as in this* is not' the subject would be equally *aprasakta*). We have remarked earlier[1] that though in normal cases 'P is in S' is translatable as 'P is *as in S*' this is not possible here. The unity effected here is loose, not a close one like 'this

is snake'. It may even be said that this unity is little more than nominal. 'In S' in the judgment 'P is in S' does not characterise and is not, therefore, predicable, in any normal sense of predication, of P[2]. The content 'snake in this' is not a unity except in name. What is apprehended here in *savikalpa-pratyakṣa* is the very reals *snake, this* and *inness, and nothing else*. The factual relation is here itself the *vikalpa* relation[3]. Such is also the case with the content "hare's horn" which is rejected in the statement "hare's horn is not". What is negated here is not truly "hare's horn", but 'horn in the hare'. Such interpretation in either case may appear circuitous. But it is inevitable, because otherwise there would be the impossible situation that a content— 'this as snake' or "hare's horn" —is both rejected and yet a real object. If only a content is interpreted this way the difficulty would be removed: there would be an easy reconciliation of the rejection of a content with its being a real object[4&5].

Because there was no genuine unity of the form 'this snake'=='this is snake' Nyāya-Vaiśeṣika takes *this*-aspect as belonging to *this rope*, not to that apparent *this snake*. The *snake* that was real was not a *this snake*, it was merely *snake*; the rope alone was *this rope*, or, better, the rope was perceived (barely) as *this*. Many Indian thinkers have not admitted this. They believe that there was a *this*-aspect as much in the false content as in the rope. But they could at all hold this, only because they believed that there was a total false object of the form 'this is snake'. Why they hold this and how far they are justified will be seen in connection with our discussion of the Advaita theory of error later. Nyāya-Vaiśeṣika, for reasons we have seen, cannot subscribe to this view.

According to Nyāya-Vaiśeṣika, the *this*-aspect does not really belong to the apparent content 'this snake'. This does not, however, mean that the business of correction is only to drop the *this*-aspect and retain the mere *snake*. It is only the Vijñānavādi Buddhists who argued that way and concluded that because 'this' means 'to be now outside me' correction presents the illusory content as not so outside, and, therefore, as subjective. The Vijñānavādin's view has been dismissed already. Nyāya-Vaiśeṣika may add that correction does not drop *this*-aspect; it only cancels *sāmānādhikaraṇya* of *this* and *snake* and presents the illusory content as 'snake in this[1]'.

J. *Alexander's theory of error examined*

Alexander's theory, though largely in tune with the Nyāya-Vaiśeṣika, differs from it in an important respect. Like the Nyāya-Vaiśeṣika thinkers, and practically on the same ground as theirs, he too holds that *this* and *snake* are each real, and as the snake-as-here ('this snake') is rejected it must be a snake elsewhere. Error lies, according to him, in mis-connecting the elsewhere snake with a sensed *this*, But the main point, *viz*, about the exact status of the illusory content 'this snake', he left untouched. He draws no distinction between object and the real, except admitting that *this snake* is a false *appearance* of the sensed rope and that the falsity of the appearance is due to the content being a joint appearance of the rope, on the one hand, and the percipient mind (or the physiological organism), on the other. If by this he means that the appearance is of the rope and yet constituted in whatever way by the mind, it would be what we have so long been terming *object*. But probably he does not mean this. He understands it as in line with his 'mere appearance' where the constitutive factors are all physical. His 'mere appearance' is not *object* in our sense; and in false appearance it is, as appears from what he says, an accident that one of the constitutive factors is the mind. Even as regards his 'real appearance', there is no contribution of the mind. By 'appearance' he only means a selected portion of reality. But in his doctrine of selection he errs in two ways. In the case of real appearance he has shown that the content of a perceptual knowledge is a portion of the reality-continuum, knowledge being nothing but a selective response. But he does not show how 'mere appearance' is a selection. The factors constituting it are admittedly not selected from the reality-continuum, but neither so is the content called 'mere appearance'. The factors, again, are parts of the reality-continuum, though not -selected; but that *content* is not even a part. It would be too much to contend that the oval shape of a round coin is a *part* of the reality. It depends on the position of the percipient's body *vis a vis* the round coin. If it be contended that the round shape too depends on the position of the body, the conclusion should rather be that every appearance—real or mere (and *a fortiori* the unreal also)— depends on the subject and is, therefore, *object* in our sense. There is no ground to overlook this dependence in either case. As a matter of fact, even the real appearance depends on selection by the mind—depends, not for being known, for that would be a truism, *knowledge* meaning selection,

but for the content being an appearance at all. This is not to be tabooed immediately as involving egocentric predicament. We never deny that though the appearance so depends there is nevertheless an independent reality as the background, and we perceive not merely the appearance but also that reality.

If Alexander wants to avoid this conclusion the only course left to him would be to hold that there is no appearance at all, but that knowledge as diaphanous directly reveals the real. But, then, there should be no talk of *selection* in the sense in which Alexander understands the term. If reality were a continuum selection would change it into a definite discrete portion, and knowledge would not be diaphanous. If, however, reality were not a continuum, but a series of discretes, knowledge would indeed be diaphanous, and the word 'selection' might be used in the *ordinary* sense of the mind being directly in contact with one specifically of the many discretes. But this would amount to abondoning the entire metaphysical structure which Alexander had built before he turned to epistemological problems. This is his second error.

As for the concept of diaphanous knowledge directly referring to definite discrete reals, we have already seen its defects in Sec. I. Here we may add one more point. If knowledge were diaphanous, directly in contact with definite discrete reals, how would perception, memory, inference, *etc.*, be distinguished from one another? We must say that either these cognitions are qualitatively distinct or their contents have perceivedness in one case, rememberedness in another, inferredness in a third, and so on, these being emergent differential characters of the contents themselves. But on the former alternative knowledge would no longer be diaphanous, and the second alternative would inevitably lead to a distinction between reality and object, that which has perceivedness, rememberedness, *etc.*, being a real, and that reality as with the perceivedness or rememberedness, *etc.*, being objects. If it be contended that the qualitative difference of types of cognition does not militate against being diaphanous—each such type directly referring to the real—we would ask: Does this reference account for our awareness of the real as *object*? Does it not merely prove that *there* is *a real* (with such and such characters)? From where, then, does the consciousness of that reality as *object* come? It cannot be said that *object* is another name for there being a real. The real was there even before I knew

it. Nor can it be said that object is only another name for that real being known, for while the 'real being known' is known in a secondary experience, commonly called introspection, the real is known as *object* even in the primary experience. Knowledge as diaphanous cannot explain this primary knowledge of a real as *object*[1]. The much maligned representationism is in this point a better account than direct realism. The only defect— though that is serious—of representationism is that it has very sharply distinguished object and reality to the extreme point of their separation[2]. They, we have so long been noting, are not separate. Except in erroneous perception[1], object cannot be dissociated from reality. Objectivity is a character accruing to the real and is itself, on that very account, believed as real. To put the matter more succinctly, object, except in false perception[2] *coincides* with the real.

K. *Prābhākara theory of error examined*

Like the object of any normal perception, the false snake has to be taken as object, though it does not coincide with the real. But this non-coincidence, we have seen, is an anomalous phenomenon, Nyāya-Vaiśeṣika tried to remove the anomaly by recognising the constituents only of 'this snake' as real. *This, snake* and the *vikalpa* relation are alone, according to them, real; the total content is not real and, therefore, no unitary object even.

The Prābhākaras have proceeded another way. They stick more closely to the basic doctrine that object (at least in perception) must coincide with reality. Object, everywhere, is nothing but a real as revealed by knowledge, objectivity being only the character of being so revealed. Because this character must belong to a real that is so revealed, there obviously cannot be an object in default of that real. Except in cases where a content is false or self-contradictory, the Naiyāyika has also held this view; he has excepted the false or the self-contradictory only because it has come to be rejected. He has rather been compelled to except it. But the Prābhākaras would argue that there is no such compulsion. There is another alternative: we may deny that the content has at all been rejected. The Prābhākaras would argue as follows:

If once it is established that object is but a real as revealed by cognition it would be senseless to modify the position to the absurd extent that there may be object even though it is not real. The false content is, of course, a challenge to this notion of object: it appears to be rejected in correction. But would it not be better, the Prābhākaras argue, to re-assess the correction-situation to see if that rejection is not only apparent, nothing serious, than abondoning the definition of object already established? The Prābhākaras contend that in correction there is as a matter of fact no rejection. Rejection is always of a content which was *known, i.e.*, taken as a *real object*. But as in correction we come to know that the false content was not a real object, this means that it was not a *known* object. What reflection certifies is the true nature of a thing. Correction as reflection certifies that there was no cognitive object. Hence truly there was no cognitive object. Nyāya-Vaiśeṣika thinkers have also admitted this logic, though only partially. They too have contended that because in correction we come to know that there was no object in the form 'this snake' there really was no such object. But immediately after this, and uncritically enough, they have yet held that som ehow they were aware of the object 'this snake' before correction. It is because of this their uncritical faith that they spoke of correction as the rejection (*bādha*) of the content. The Prābhākaras, on the other hand, hold that no content—not even the total content 'this snake' —is rejected. If at all anything is rejected it is only the knownness, the cognitive character, of the total content, the content remaining untouched. But even this cognitive character is not *rejected*. Rejection of it would imply that before correction the content 'this snake' was apprehended as a cognitive object. Correction certifies this much only that there was no cognitive object like 'this snake'. A cognitive object is *ipso facto* real (*pāramārthika*). Correction certifies only that it was not cognitive, but conative (*vyāvahārika*). Hence even before correction we were aware of it as only a conative unity. *This* and *snake* were, however, cognitive and, therefore, rear objects; the question here is not about them, but about the content 'this snake' = 'this is snake'.

But how is it, it may be asked, that when *this* and *snake* were *known* as real objects the total content 'this is snake' was not a cognitive object? The Prābhākaras reply that the so-called total situation was, from the cognitive point of view, a sheer privation: we only *did not distinguish* the two cognitions—one of *this* and the other of *snake*; or, better, the two cognitions remained undistinguished, and the so-called unitary content, cognitively

speaking, is only their non-distinction. True, we acted according to this so-called total content, we fled when we saw 'this snake'. Such acts, it is true, could not be prompted by sheer privation, and we have therefore to admit a *positive* unitary content and a positive awareness of it. But the Prābhākaras argue that though such positive unitary content and positive awareness have to be admitted the unity and the awareness are not *cognitive*. 'This is snake' is, in other words, no *object*. It is either what is only referred to by conation or a mere verbal unity.

Two things non-distinguished are often taken as one unity in the context of an act. It is the act which treats them as though they are unified. Act or will is normally indeed a response to a cognitive unity. But even in every such normal act there are contents which are cognised as non-distinct and yet unified by that act. What is called object of will is primarily the object of the cognition that causes the will; but in every will there is inevitably reference also to the means and a purpose which do not stand cognised as related to that object or to one another. By 'purpose' here is meant the actualisation (*bhāvanā*) of the object. The object of will was cognised as only a future reality, but there was no cognition of it as *to be actualized*. Futurity of the object was no doubt cognised, but it means only future actuality, not the dynamic *to be actualized* which is a peculiar unification, through will only, of the object and its futurity. X, Y, Z which are *means* to that actualisation were also cognised, but not *as means*. Their means-hood (*upāyatā*) is another peculiar unification, by will only, of X, Y, Z with that object of will. They might have been cognised as causes, but not as means. Means-hood and purpose-hood are absolutely conative categories. Action alone thus unifies contents which are cognised as non-distinct, *e.i.*, unrelated to one another, relation necessarily presupposing that relata are known as distinct from one another. We have seen that the contents of *nirvikalpa-pratyakṣa* in Nyāya-Vaiśeṣika were also known as non-distinct from one another, 'non-distinct' meaning here, as also in the Prābhākara view under discussion, not that the contents are each known with its self-identity[1], but that they are not known as each being *not another* or each dissociated from another. We have also seen how in *savikalpa-pratyakṣa* these non-distinct contents get related to one another and turn into a unity (though these relations and that unity are not merely subjective). Such unity is *cognitive*. The Prābhākaras only contend that there is also another type of unity which, as described above, is conative. The conative unity is called by

them *vyāvahārika*. As in normal will, so also in illusion the unity 'this snake' is *vyāvahārika* only. *This* and *snake* get unified in the context of act only.

There is another possible account of the positive unity of the illusory content, and some Prābhākaras have admitted that. It is that the unity is only *verbal*. In a sense the Naiyāyikas also regard the unity, not only here but even in normal *savikalpa-pratyakṣa*, as verbal. Every *savikalpa-pratyakṣa* is, according to them, *śabdānubiddha. Vikalpa* relations are necessarily semantic forms of language, forms of language *spoken*, not *heard*, language that is *spoken* being, as spoken, undissociable from *knowledge* as judgment. The language that is dissociated from *knowledge* as judgment is the language which is *heard*, such language as heard being taken as a system of sounds or marks producing in the hearer another judgmental knowledge which, however, is not then spoken by the hearer implicitly or explicitly. The unity, thus, not merely in illusion but in every case of *savikalpa-pratyakṣa* is, according to the Naiyāyika, verbal. But the Naiyāyika has not refrained from saying that as much in illusion as in every case of *savikalpa-pratyakṣa* it is also real and, therefore, an object. These Prābhākaras, however, here part company. They agree with the Naiyāyikas that in normal *savikalpa-pratyakṣa* the unity is an object and would even go farther and hold that there is such unity as object even in *nirvikalpa-pratyakṣa* where it remains in some latent form. But they would entirely disagree with them so far as the content of erroneous perception[2] is concerned. The unitary content is in this case merely verbal, not real.

Whichever way 'this snake' is interpreted—whether as non-distinction of *this* and *snake* or as a conative or a merely verbal unity of these there is no question of its rejection. What may be said to be rejected is only the positive cognitive character of 'this snake'. But, as already seen, even this is not rejected, we only deny it. Even before correction 'this snake' was not apprehended as a possitive cognitive object.

The Prābhākara view is in perfect consonance with the doctrine that every cognitive object is real. But its weakness also is evident, and the weakness is fundamental.

The Prābhākara contention that even the cognitive character of the object 'this snake' is not rejected, but only negated, does not appear to be a sound

account of the business of correction. Whatever be the Prābhākara theory, we do feel that before correction we were aware of 'this snake' as a cognitive object. It is too much to claim that we were aware of it as a conative or only a verbal object or as *this* and *snake* non-distinguished. The Prābhākaras were right in claiming that reflection offers a true account of the nature of the thing reflected on. But this does not mean that even before reflection we were aware of the thing in that correct way. Often the reflective account appears, without any hitch, as contradicting and often, again, as rejecting the unreflective account. There is no good reason why the Prābhākaras should discount the second contingency. Rejection (*bādha*) is often an actual phenomenon, and it is no good fighting shy of it. But once we admit rejection it would mean good-bye to the Prābhākara theory.

---

[1] Subjectivity, however, is not in this way an extrinsic property of knowledge. We have shown in Sections I and II that, according to Nyāya-Vaiśeṣika, every knowledge is necessarily *of a real*. This means that with the very emergence of knowledge it stands as subjective (*viṣayin*). We are here describing the Nyāya-Vaiśeṣika view of object only.

[2] By 'relational property' here is meant relation itself as the property.

[1] Nor are they necessarily objective: they are objects in the context of knowledge only. Metaphysically, they are neutral reals.

[2] Though it is necessary that there must be an *anuyogin*, the particular *anuyogin* in a particular case is an empirical accident. Hence the relation cannot be said to be constituted by that particular *anuyogin*. The *pratiyogin*, however, of the relation is constant.

[1] Non-judgmental perception is, according to Nyāya-Vaiśeṣika, no intrbspectable stage. It is certified by inference only. Introspectable knowledge is in the minimum *savikalpa-pratyakṣa*, and its content is apprehended as a substantive-adjective complex. But the awareness of a complex is impossible unless it was preceded by the awareness of the constitutive simples. This is the same thing as saying that the awareness of object presupposes the awareness of reals as such.

[2] Unless contradicted.

[3] Whether it may not be a primary illusion of the human mind, so that it cannot have an analogue, and whether Advaita and Buddhism are justified or not, and if so, to what extent, will be seen later.

[1] There is no way out, because to be independent of knowledge and to be constituted by it stand equally evident. This means that no defect in either is discovered. Further, of the two awarenesses— one of independence and the other of constitutedness—neither is finally later than the other. It is true that we first apprehended the object as independent, and then later, through analysis, find it to be constituted by knowledge. But the fact remains that even after we have found this the object is apprehended as independent. Hence there is neither *doṭadatsana* nor *uttarajñānapakṣāpāta*. To say that analysis as *yukti* is stronger than *pratyakṣa* would be irrelevant here. *Yukti* is stronger either when it leads to the discovery of a defect in the cognition rejected or when the prior cognition is so clearly felt as rejected that its content suddenly disappears or when the point of view is of *prāmāṇya* (validation of a cognition), not of primary assertion which is just belief or *taking* something to be

real. But here neither a defect in the pre-*yukti* cognition is discovered nor its content suddenly disappears nor is the point of view that of *prāmāṇya*.

[2] Some Nyāya-Vaiśeṣika thinkers hold that even if objects and forms of objectivity cannot be reduced to thesfcatalogued *padārthas* there is nothing to be ashamed of. They believe that the sevenfold classification of *padārthas* is not final, but only a prescription. They hold that if *per force* other types of *padārthas* have to be admitted this would not go against the Nyāya-Vaiśeṣika spirit. Nyāya-Vaiśeṣika, in their opinion, is *aniyatapadārtha-vāda*.

[3] As in Section I, we shall use these two terms, meaning by the former 'constitutively determined by knowledge' and by the latter 'independent of knowledge' or 'belonging as a property to the real'.

[1] The universal as quite real ia similarly, for Stout, exhausted in the relevant particulars.

[1] The Nyāya-Vaiśeṣika theory of error will be discussed again in detail later in this essay. Here, and there also, we have discussed the theory which is most consistently Nyāya-Vaiśeṣika. Different Nyāya-Vaiśeṣika thinkers are not always unanimous in their views of error. They often differ in fundamentals even.

[1] For detailed analysis of the *vikalpa* relation involved in the categorical judgment see author's "Object Content and Relation"—Chap. II.

[1] The defect to be pointed out must not be a *deus ex machina*. It has to be a *vera causa*.
One point regarding the function of defect. Some believe that it is no ground for rejection, but rather an explanation as to how illusion did at all occur. But this is untenable. Assuredly in some cases an object is rejected because of a defect discovered in, the knowledge of it. If so, why may it not be a ground in some other cases also?

[1] Logical Positivists take *truth* in this sense as without metaphysical import. By "truth" they mean exactly what Indians mean by "*prāmāṇya*".
Even *Naiyāyikas* who recognise extrinsic truth, *i.e.*, believe that truth =*pādmāyṇa* is extrinsic to primary assertion, are not clear on the point whether truth has metaphysical import, except when they say that the inference which establishes the *prāmāṇya* of an assertion is based on its *samarthapravrttijanakatva*.

[2] The problem of *prāmāṇya* will again come up for discussion later.

[1] "Really real" means that it is wholly independent of the knowledge of it.

[2] This is why Nyāya-Vaiśeṣika maintains that the cause of *savikalpa-pratyakṣa* is not its (total) content, but only the corresponding *nirvikalpa-pratyakṣa*.

[3] *Vide* author's "The Business of Philosophy" in the Proceedings of the Indian-Philosophical Congress, 1955, and "Objective Attitude and Idealism Proper" in K.C. Bhattacharyya Memorial Volume.

[1] *Vikalpas* are constituted not merely by knowledge (thought) but by language also. Naiyayikas also say that *savikalpa-praiyakṣa* is *śabdānvbiddha*. They only insist that the total content of *savikalpa-pratyakṣa* is real also.

[1] Throughout the following few pages we assume that *nirvikalpajñāua* is an introepectably deteoted stage.

[1] The whole and a part, however, are not in contact with one another. What that relation is will be seen very soon.

[1] The whole (of parts) is not here SP. SP here is the totality of the whole and the parts.

[2] Inoluding illusion as not yet corrected.

[1] It is true that objectivity without reality is an equally perplexing notion. But the basic problem of error is just to understand this situation in a way that would remove the perplexity. It has been shown in the next few pages how different Indian thinkers, and some Western thinkers also, have struggled with the situation to discover the correct perspective. Except the Sunyavadin, everybody in India has admitted that though the *total* content of illusion is not real, there is some reality nevertheless. The discussion has brought to the fore further characters of the object here. Some hold that it is a loose unity, some that it is no *cognitive* object and some that it is a new type of cognitive object, called *prātibādsika*. The Vijñānavādin's contention that the illusory content is a subjective reality is only too hasty.

[2] By 'content of correction' is meant the content of the corrective judgment, not what is corrected.

[1] We are here concentrating on *perception*. It will be shown later, in connection with the Advaita view of object, that in non-perceptual cognition object is felt, to whatever extent, as dissociated from the real. But that in no way affects their complete coincidence (identity) in perception.

[1] Non-existence is also a form of reality.

[2] If reflectively, or in some specific cases, *e.g.*, in correction and non-perceptual cognition, object is felt as dissociated from the real, this does not affect their complete coincidence (identity) in normal perception. Reflection, as we have seen, does not here reject what is experienced in normal perception. If still one feels preference for reflection or for those specific cases, this is either sheer prejudice or suggests a transcendental standpoint (not logically substantiable) which demands re-orientation of all that we have known through ordinary means of knowledge.

[1] Most of the Indian thinkers believe that it is a postulate not merely of perception, but of all kinds of knowledge.

[2] Amended in footnote (3) to the next page.

[1] '*Svarūpa*' might have been translated as 'character'. But such translation is risky, as it might suggest that the rope was not apprehended in *nirvikalpa-pratyakṣa*.

[2] Or the snake-*svarūpa* itself as remembered. Gangeśa, for other reasons, believes that what acts as *sannikarṣa* here is *doṣa*.

[3] The snake-*svarūpa* is not indeed apprehended in *nirvikalpa-pratyakṣa*. It is the content of such memory as is due to the maturation of the disposition (*saṁskāra*) of a prior *nirvikalpapratyakṣa* of snake.

[4] In the sense that there was no object of the form 'this is snake'.

[1] It is not denied, however, that we somehow apprehended it as object. Correction sublates this object.

[2] *Vide* p. 31 ff.

[1] *ibid.*

[2] Normally all *relational* judgments are also *characterising* judgmnts—'P is in S' is translatable into 'P is *as in S*'. So far modern mathematical logicians have scarcely improved on the Aristotelian logic. It is only when an erroneous or a self-contradiotory content is sought to be represented in the form of judgment that we have relational judgment proper.

[3] Normally in 'P is in S' there is a secondary *vikalpa* relation, because the proposition can be written also as 'P is *as in S*'. But this is not true of 'horns in the hare' or 'snake in this'. See p. 31 ff.

[4] As the content 'snake here (*in this*)' is negated the false snake is really the 'snake not here', *i.e.*, the 'snake elsewhere'.

[5] Vácaspati Miśra did not interpret the false content in this way, and was consequently compelled to admit an additional *vikalpa* relation which, according to him, was not real, *i.e.*, *asat*. But obviously this is not in tune with the realism of Nyāya-Vaiśeṣika.

[1] We have only *presented* the Nyāya-Vaiśeṣika view, and our purpose was only to show what light this view of error throws on the problem object *vs* reality. The Nyāya-Vaiśeṣika view of error will be criticised in connection with the Advaita view treated later.

[1] We may also point out that each such type presents the real in different aspects. Perception, *e.g.*, presents it in both *sāmānya* and *viśeṣa* aspects or in the *viśeṣa* aspect only; but inference presents it only in the *sāmānya* aspect (it does not present the *sāmānya* aspect only, the definite particular real is presented in that aspect). Now such aspects are not *parts* of the real, so that the concept of appearance (object) is here unavoidable. Or, we might say with the Advaitin that while perception removes both *asattāpādaka-ajñāna* and *abhānāpadaka-ajñāna* inference removes the former only. Here also these *ajñānas* are not *parts* of the real. As for what happens in memory, we need not discuss that here.

[2] Whether such sharp distinction is ultimately a defect or not will be examined later in connection with the Advaita view of object.

[1] Whether or not in non-porceptual knowledge also, will be seen later.

[2] *Ibid.*

[1] This self-identity is what is called in other systems *viśeṣa*, and in Nyāya-Vaiśeṣika the very *svarūpa* of the content.

[2] Throughout this section we are considering erroneous *perception*, not error in non-perceptual knowledge.

Stephen H. Phillips   **Padmapāda's illusion argument**

INTRODUCTION

Advaita Vedānta's tradition of reflection on perceptual illusion arises out of a concern with *mukti*, a "liberation" or "salvation" that is conceived as a radical change of awareness, thus as a "mystical experience." Developing the teachings of the Upanishads and the *Bhagavadgītā*, Śaṅkara (circa 700 A.D.) and his followers try to articulate a world view that would explain the possibility of this mystical state and show it to be the *summum bonum* (*paramapurusârthā*). It is problematic whether any Advaita philosopher, even the great Śaṅkara himself, is a "mystic philosopher," that is, one who attempts to describe his own mystical experience and to theorize therefrom. But convinced that a kind of *experience*, albeit a mystical experience, is the most important matter in life, the Advaitins try to formulate a comprehensive theory of experience (*anubhava*) that would conform to their soteriological views. Above all, it is the topic of perceptual illusion that forms the bridge between the Advaitins' soteriology on the one hand and their theory of experience on the other. The relation of the salvific experience to our everyday experience is viewed as analogous to the relation between veridical and delusive sense perception.[1]

 Śaṅkara, in the very first sentence of his *Brahmasūtrabhāṣya*,[2] uses the term 'adhyāsa', literally "superimposition" but also "false appearance," to capture the relation between the natural and mystical state of the self's true experience on the one hand and worldly experience on the other.[3] The Advaitin then asks, "What is *adhyāsa*?" and proceeds to give two characterizations (or definitions) of it. The second of these he defends with references to everyday instances of illusion. Thus in this opening passage, and in pronounced fashion in his Upanishadic commentaries and his *Upadeśasāhasrī* as well, Śaṅkara articulates an understanding of "*adhyāsa*" that is supposed to include both everyday and mystical phenomena.[4]

Further, in this "*adhyāsa*" section of his *BSB*, he mentions some alternative views of illusion, apparently for descriptive as opposed to polemical purposes: without disputing these views, he puts forth his second characterization and claims that it would be acceptable to all disputants.[5] Therefore, with these characterizations, Śaṅkara must be seen as launching Advaita "phenomenology of perceptual illusion."

However, it is only after Śaṅkara that Advaita phenomenology and indeed critical reflection overall become advanced. Śaṅkara himself is so much less concerned with argument and justificational issues than with elaborating the soteriological teachings of diverse Upanishadic texts that many of his more properly philosophic views are too inchoate and embedded in other discussions to repay at all easily a scrutiny,[6] although many modern reconstructions of his positions have appeared. His followers inherit the soteriological and textual concerns, but they also try to be systematic and to refute opponents on a whole range of issues. It is with Śaṅkara's disciples, Padmapāda, Sureśvara, and Vācaspati, and *their* followers that the Advaita polemics and phenomenological analyses become truly astute.

Advaita theory of knowledge and related phenomenology become increasingly broad in scope as, through the years, there is a shift in the focus of Advaita reflection. In general, more and more attention is paid to cosmological and worldly (*vyavahārika*) issues, while Śaṅkara's embedded epistemological positions are enormously filled out. By the time of the *Vedāntaparibhāṣā*, the famous seventeenth-century textbook of Advaita epistemology, the topic of perceptual illusion is taken up not so much within a soteriological discussion as within a wide-ranging explanation of "means of knowledge" (*prāmaṇa*) in general.[7] The *Vedāntaparibhāṣā* incorporates centuries of reflection—much of which originates in rival schools—on topics ranging from particulars and universals to the foundations of claims about the nonpresence of something x. (Do I directly perceive that there is not an elephant here?) Thus one should not think that Advaita epistemology is limited to a concern with perceptual illusion, particularly in the later period. Yet in the *Vedāntaparibhāṣā* and in many intermediate works, the early phenomenology of perceptual illusion, and in particular that contributed by Padmapāda, informs crucially the theory of knowledge, somewhat like the influence of Descartes and Hume in the West.[8] It clearly forms the mainstay of the central Advaita positions.

Padmapāda is generally admitted to have been Śaṅkara's younger contemporary and his student. Along with Sureśvara (who most likely was also a student of Śaṅkara) and Vācaspati Miśra (who was probably at least a generation later), he is the originator of a distinct line of Advaita commentary. These three are the founders of the *prasthānatraya*, "three lines of interpretation [of Śaṅkara]," known to students of Advaita. Padmapāda launched a tradition of commentary and understanding of Śaṅkara to which several prominent philosophers belong, including Prakāśātman (circa 975), the title of whose lucid (but often unfaithful—see note 12 following) commentary *Vivaraṅa* has become the name by which this branch of Advaita is commonly known; Citsukha (circa 1275), the logician and polemicist who purports to refute all the late schools; Mādhava (circa 1350), who is best known for a wide-ranging survey of Indian schools;[9] and Dharmarā-jādhvarīndra, the author of the *Vedāntaparibhāṣā* previously mentioned. There are also several lesser figures who belong to Padmapāda's "line," and the number of Sanskrit commentaries written on his work is large.[10]

In this article, I wish to examine Padmapāda's thought on illusion—with an eye to evaluating his metaphysics. Despite the sophistication of Padmapāda's analysis, the marriage between the metaphysics and the understanding of illusion is an unhappy one. Yet this point could be turned around: although, as I shall show, Padmapāda is unsuccessful in his attempt to show through an illusion analogy the possibility (*sambhava*) of his views about the Absolute (*brahman*), his meticulous phenomenology of the mental life has merits of its own. I shall not slight it by jumping too quickly into an examination of the metaphysics. Only after presenting with some detail Padmapāda's analysis of everyday illusions do I take up the metaphysics of Advaita and demonstrate the failure of his illusion analogy.

Another aim of this article, overlapping the evaluative concern, is historical. I contend that Padmapāda's view of illusion illumines his metaphysics of *brahman*, the "Absolute," and of *brahman*'s relation to *māyā*, the "cosmic illusion." This metaphysics has been misunderstood by some scholars of Indian philosophy.[11] By elaborating Padmapāda's use of the illusion analogy, I intend to show precisely what his views are on the nature and ontic status of "*māyā*." While it is a matter of debate to what degree he departs on this score from Śaṅkara, his views on *māyā* are not the same as those of Prakāśātman, his famous "follower" who lived about two

centuries later.[12] Also, Padmapāda's insistence on defending the possibility (*sambhava*) of the truths revealed by *śruti*, "scripture," along with the phenomenology, achieves a quantum leap in Advaitic philosophic procedure. This type of reasoning, in addition to the phenomenological arguments, represents a major development over Śaṅkara.[13] This article is not directed principally to questions of Padmapāda exegesis or of his place in the evolution of Advaita, but it is intended to investigate further what is hardly a fully worked mine.[14]

THE DISTINCTION BETWEEN ILLUSION AND MEMORY

Padmapāda's principal work, the *Pañcapādikā*, is a commentary on that portion of Śaṅkara's *BSB* which explains the first four sūtras of the *Brahmasūtra*.[15] Presumably, the work was to take up the first five sections of Śaṅkara's *BSB* (that is, the entire first chapter and the first section of the second), but all we have is a commentary on Śaṅkara's treatment of sūtras 1.1.1–4.

As noted, at the beginning of Śaṅkara's *BSB* the key topic is illusion as the appropriate analogue for the Self's true experience in relation to one's experience of the everyday world. Padmapāda focuses first and at length on this part of his teacher's treatise. We remarked that Śaṅkara characterizes illusion in two ways. These are, first, "an appearance (*avabhāsa*) of something previously experienced—[in this way] like memory—in something else."[16] Then after relating three alternative views, he gives a second "minimalist" characterization that is presumed to be acceptable to all disputants (as well as to conform to common usage): to wit, "the appearance of one thing with the properties of another."[17] As I indicated, it seems to me that Śaṅkara, because he gives the second characterization without a word of dispute for the alternative positions, is not so much concerned with the precise nature of illusion as with making a soteriological point. He wants merely to refer to illusions as the phenomena that are—within our everyday experience—the appropriate analogues for the relation of the world to the single transcendent Self. But Padmapāda takes it upon himself to show that each of Śaṅkara's characterizations is superior to

alternative views, and does not elaborate the minimalist point. His concern is with disagreements on illusion among rival schools.

Padmapāda begins his discussion by distinguishing an illusory cognition (*mithyājñānā*) from an instance of memory. He has two goals in this regard. First, he wants to show in what sense the term '*smṛtirūpa*', "like memory," is used by Śaṅkara in his first characterization. Second, he wants to establish—against an alternative view of illusion ("*smṛtipramoṣakhyātivāda*" interpreted as "*akhyātivāda*" by some of the commentators[18])—the positions that illusion has a distinct phenomenological character and, most importantly, that cognition is unitary. According to the alternative view, illusion is predominantly memory but also involves two cognitions, a sense cognition as well as a memory cognition, somehow blended together (because the "awareness of remembering" is obscured or "stolen away").

The reason that Śaṅkara uses the term *smṛtirūpa*, "like memory," is, he says, to suggest that there can be no illusory appearance of something that has not been previously experienced, just as there can be no memory of something whereof one has had no immediate acquaintance. This is a view that Padmapāda wholeheartedly endorses. Sensation creates mental (or subliminal) impressions (called "*saṃskāra*" and "*vāsanā*"), while both memory and illusion involve, psychologically considered, the activity of these sense-created impressions.

The way in which mental impressions inform a present cognition is complex on Padmapāda's view. He elaborates this portion of his theory while disputing the *smṛtipramoṣakhyāti* view just mentioned.[19] To translate the text, the position to be refuted (the "*pūrvapakṣa*") is:

The cognition of something x that occurs when the eye is in contact with a different thing y is just memory, but there is an obscuration (*pramoṣa*—"stealing away") of the awareness that it is a remembering. Because of some defect of the instruments [or causes] of cognition, i.e. the senses, etc., there arises a memory-awareness of a particular object, while the capacity of the organ to present the distinct thing with which it is in contact is vitiated by the defect. In this way, solely because of the defect of the sense-organ, there is a failure to note the distinction between the memory and the sensation which arise together, and thus the error is produced that there is a single [cognition] that in fact has not occurred, as in the case of two trees in the distance [perceived as one].[20]

While according to this, the opponent's position an illusory cognition is predominantly memory, Padmapāda believes that an illusion has little in common with an instance of memory except in one respect. This is that, in

both, the object cognized has been experienced previously. (This is what Padmapāda sees as the point of Śaṅkara's use of ʿ*smṛtirūpa*ʾ, as we noted.) He insists that as a presentation (*avabhāsa*) an illusory cognition differs crucially from an instance of memory in its clarity ("*spaṣṭam*") and immediacy ("*aparokṣârthâvabhāsa*").[21]

Then in addition to this phenomenological argument, Padmapāda presents a linguistic one. He points out that if the object of an illusory cognition were the same as the object of an instance of memory, then a person deluded by, for example, a piece of mother-of-pearl appearing as silver would make the judgment ʿThat silverʾ, not ʿThis silverʾ, as actually occurs. In Sanskrit, the term ʿ*idam*ʾ, "this," is used to refer to an object presented in immediate experience, while the term ʿ*tat*ʾ, "that," is reserved for objects previously experienced and remembered. Thus the common usage tells against the opponent's position. This, to my mind, is Padmapāda's best point against the *pūrvapakṣa*, although surely the phenomenological argument is also a good one.

But this is not all he says. He also attacks by asking, "What is an awareness of remembering (*smaraṅâbhimāna*)?" According to the opponent, it is this awareness of remembering which, invariably present in an instance of correct memory, is obscured or suppressed by a sense defect in an instance of illusion. Padmapāda avers that there is no particular form in which an awareness of remembering presents itself and by which it can be discerned.[22] He is firmly convinced that cognition is unitary. And I believe that it is, above all, this supposition that rules out for him the possibility of any such distinct awareness of remembering. But he does seem to have some good phenomenological points. First, we are not *always* self-conscious about our remembering when we recall something or other. This is particularly evident in recalling the meaning of words: in comprehending the meaning of a sentence one must recall the meaning of individual words, but one does not recall their meaning *as* remembered meaning. So there is clearly no "awareness of remembering" in this instance.[23] Second, memory is invariably "intentional": one cannot engage in an act of remembering without remembering some object or other. No awareness of remembering occurs entirely apart from the objective content of the memory.[24] But Padmapāda's eschewal of the idea of *smaraṅâbhimāna* involves more than the denials that there is any

remembering that is "nonintentional" and that in all instances there is plainly a self-consciousness about the remembering. He says in a sweeping fashion that whereas admittedly one sometimes designates an object as remembered by a certain usage—for example, "I remember (such and such)"—still even then, as always, no distinguishable "awareness of remembering" is involved.[25] Thus here he appears to be guided not by phenomenological considerations but by a peculiar idea of the unity of cognition. Surely we can be aware of engaging in the act of remembering— in some cases with little attention to the objects remembered. (Imagine an amnesiac questioned by a physician: "Can you remember what you ate for breakfast? Can you picture the entrance to the hospital?" The point in these cases would be to focus on remembering itself, not its objects.) Some of Padmapāda's arguments in this passage (*Ppk* 45–47) appear to be mere hand-waving. In fact his eschewal of the notion of self-conscious remembering is one indication that his is a "one-dimensional phenomenalism"—a position the full implications of which I shall explain in the last section.

Now an everyday cognition is no simple unity according to Padmapāda. Judgments (reflecting cognitions) do indeed, he says, involve mental impressions, because judgments are expressed in words whose meanings are remembered. Further, in the inference 'The mountain is fiery' (made by one who sees only that the mountain is smoky), mental impressions of past experiences of fire conjoined with smoke clearly have a role. Also, in an instance of recognition (for example, 'This is that Devadatta whom I met previously'), mental impressions are responsible for the "that" portion of the judgment. But in all these cases there is only a single cognition in part influenced by memory (*smṛtigarbha*), not two cognitions.

The references to cases of inference and of recognition are presumed to show the possibility (*utpādana = sambhava*) of a unitary cognition. Thus there also *could* be a unitary cognition in the case of an illusion:

… it is evident that an inferential cognition [e.g., as expressed in the judgment 'The mountain is fiery'] arises from a [direct] cognition [i.e. sensation] of the inferential mark [e.g. particular smoke] together with mental impressions, while an instance of recognition [e.g. as expressed in the judgment 'This is that Devadatta'] arises from eye-contact together with mental impressions. In both these cases as well [as in illusion], there is just one single valid cognition that is "impregnated" with memory (*smṛtigarbha*). Without an arising of mental impressions, both [of these two types of valid cognition] would not occur…. Nor is there, moreover, any [other] reason to believe that in these cases we have two cognitions.[26]

The unity of inferential cognitions and of those of recognition reveals, Padmapāda argues, the possibility of single yet "memory-impregnated" cognitions. That this possibility is actual in the case of illusion he presumably takes to be demonstrated by the unitary judgment it provokes, for example, in '*idam rajataṃ*' "This silver," just as with inference and recognition, although he is not explicit here.[27] In any case, a key idea in this section is the unity of consciousness in the present moment. Later, we shall review the role of the idea in Padmapāda's metaphysics.

Also important here—though for a different line of the metaphysics—is that Padmapāda sees the force of his opponent's position as deriving from the need to explain *causally* the contrast of illusion and veridical perception. He wants to appropriate that force into his own position. Note that according to the *smṛtipramoṣakhyātivādin*, illusion comes about through a break in the causal chain characteristic of veridical perception. Padmapāda agrees.[28] He too embraces a causal theory of perception (*pratyakṣa*) in general, and as we shall see, much of his explanation of individual instances of illusion relies on the identification of causal factors. His disagreement with the *smṛtipramoṣakhyātivādin* is limited to the characterization of the mental life.

THE "OBJECT" OF AN ILLUSION

Padmapāda, we have seen, in part uses a linguistic argument to refute the *smṛtipramoṣakhyātivādin*: we say '*dam rajataṃ*' "this silver," not '*tad rajataṃ*' "that silver," when presented with what we take to be silver, whether the presentation be illusory or veridical. What then is the reference of the term '*idam*' the "this" used as an ostension? Padmapāda sees the thing (*viṣaya = artha = ālambana*)[29] pointed to as the presented "silver" supported by the real mother-of-pearl (*śuktigatamithyārajata*). Here he is opposed first of all by "realists" who espouse *anyathākhyātivāda*, "the view that illusion is the perception of something as otherwise (than the way it is in fact)," for example, certain Naiyāyikas or "Logicians." His attack against this view reveals the extent to which Padmapāda is a "phenomenalist." My reading is that he is a phenomenalist on the issue of the criterion of the *ultimately* real. But although his is a radical phenomenalism on that issue, it is hardly thoroughgoing or comprehensive: his ontological position is

peculiarly Advaitic, having little in common with the Western subjectivist systems (such as Berkeley's) that espouse a phenomenalist position on the issue of the criterion of the real.

The opponent's *anyathākhyātivāda* is presented as a naïve realism, though one with a peculiar wrinkle. Padmapāda's opponent claims that the illusory cognition not only presents something real, the something *can satisfy desire*. In the stock example, the deluded person on the beach would be seeing a real piece of silver in the marketplace through some bizarre extension of his normal power of sight. (And he would not realize that he has such capability—unless he were an astute philosopher.)

Padmapāda pokes fun at the view so rendered, except for its understanding of the nature of an "object" of a (perceptual) cognition (whether illusory or veridical). This is the idea that such an "object" is presented as something toward which purposeful activity *might* be directed. The Buddhist Dharmakīrti and the Naiyāyikas argue that "*arthakriyā*," "causal efficiency" and "capacity to fulfill an aim," is the mark of a true "object" (or real thing, *vastu*) in that a real thing is capable of satisfying desire and thus is *appropriately* sought in action.[30] In other words, according to Dharmakīrti and the others, whom I see as "pragmatists," something is real just in case it can satisfy a desire. A mirage is not real just because it will not quench thirst. Nor is there a danger that one could be bitten by the snake of the "snake-rope" illusion. Thus the Indian pragmatists have a "holistic" notion of experience such that experience would involve activity in the world, and, more precisely, interaction with worldly objects.[31] Padmapāda, on the other hand, does not use the term '*arthakriyā*', and incorporates only as much of the theory as suits his purposes: instead of '*arthakriyā*' he uses the term '*vyavahārayogya*', "suitable (as the object of) [illusory] worldly activity."[32] The term '*vyavahāra*', "worldly activity," is used by Advaitins to designate the illusory world of our everyday experience in contrast to the transcendant reality of the Absolute, Brahman. Thus this usage shows that Padmapāda does not believe activity has anything to do with the means whereby the real is to be discerned. Although the expression echoes the pragmatists' position, for Padmapāda it means only that a perceptual presentation is a presentation of something that appears as though it could be an object of purposeful activity. But "purposeful activity" is itself illusory from the sublating perspective of the single Self. All worldly activity is *māyā*,

"illusion," according to Padmapāda, and is revealed to be so by the sublating cognition that simultaneously reveals *brahman*.[33] Consonantly within the "*vyavahārika*" perspective, the means whereby an illusory object (of the "silver" and "snake" sort) is discerned as such is, he says, not interaction but a sublational cognition, for example, as expressed in the judgment "This is mother-of-pearl." Thus the point is that according to Padmapāda the illusory silver is *presented* as an appropriate object of desire. One does not find out that it is incapable of fulfilling desire until one has a sublating experience that shows it to be unreal. Not the capacity of the object to fulfill desire is the criterion whereby veridical and illusory experiences are to be discriminated. Rather, only a further experience can be the basis for that determination—at least with illusions of the silver-mother-of-pearl sort (we shall see that Padmapāda distinguishes between two broad types of illusion and that it is only with regard to one of these that the character of the immediate presentation is all-decisive). Padmapāda goes no further in his embrace of the notion *arthakriyā* than to hold that the object (*ālambana*) *appears* as an appropriate object of desire. This, in his view, is only a matter of phenomenal fact, with no special ontic relevance. The contrast of Padmapāda's phenomenalism with the pragmatism of this group of opponents is extremely important, and we shall return to it in evaluating his theory in the last section.

Yet despite his stance on "*arthakriyā,*" Padmapāda's phenomenalism is limited. The "silver-mother-of-pearl" (also "snake-rope") type of illusion is, he says, the appropriate analogy for the metaphysics of Brahman, but it differs crucially from a second type that he identifies. Four examples of this second type of illusion are given: (1) the bitter taste of something sweet to a person with hepatitis ("diseased with bile"), (2) the sight of a double moon (*dvicandra*) by an astigmatic, (3) the red appearance of a crystal because of the proximity of a red flower, and (4) the reflection of an object in a mirror. These are presentations that remain false, Padmapāda points out, even after one understands that they do not present a true reality, unlike the case of the snake and the rope.[34] One can know that these presentations are false (*mithyā*) while they remain immediate presentations.

Padmapāda does not give full details about how this is possible, beyond distinguishing between the two kinds of illusion. To be sure, he finds other *pramāṅa*-s, "means of knowledge," and it is in particular the *pramāṇa* inference (*anumāna*) that appears to be operative in this "counter-

intuitional" discernment. Further, the inferences here are drawn based on causal relations.[35] But "Why are there means of knowledge in addition to the character of experience?" and "How are these *pramāṅa*-s related one to another?" are questions that Padmapāda does not directly address, although, as I shall argue, on the latter question he appears to have a pretty definite view.[36] There is a tension in Padmapāda's position: sense perception (*pratyakṣa*) provides a reason to believe that, for example, the crystal is red, while inferential reasoning based on causal relations urges that such an appearance is false. Why should the character of an immediate presentation be the criterion of the real in some instances but not in all? Padmapāda's commentators give more thought to the question than does Padmapāda himself, but the groundwork for a response is indeed present in his distinction of the two types of illusion—along with his complex use of the distinction in explicating the metaphysics of Brahman.[37]

The presentations of the second type of illusion (the red crystal, and so forth) are relational (*sopādhika*); their very nature invites reflection on the relations of one thing to another. Indeed, experience itself teaches that sense presentations in general are mediated by complex causal factors. But all this causal interaction is conditioned by the polemics of the first type of illusion, which is relationless (*nirupādhika*).[38] Recall that Padmapāda accepts that the object of a perception *appears* as an object of purposeful activity, while viewing the entire realm of activity as illusory. In parallel fashion, he sees objects as standing in a causal chain that involves the sense organs while he also maintains that the entire nexus of causal relations in negated in the Self's true perception.

The causal nexus is complex on Padmapāda's account. The presence of the object is a necessary but not a sufficient condition for the perception of it.[39] Many contributing factors are identified: a causal theory of perception (embraced by many of the Indian schools with variations) is by the time of Padmapāda already quite developed. The object perceived, along with many variables pertaining to distinct kinds of objects, light (or another medium), the sense organ, subliminal impressions, the internal organ (*manas*), and the self are all necessary factors. (We might call this Advaita *psychology* of perception, except for the factors relating to external objects such as the transparency of a crystal.)[40] Through identifying the conditions (*upādhi*) that influence perception, Padmapāda can agree with many of the rival

thinkers that the reason that, for example, a person diseased with an excess of bile sees white things as yellow is a defect in the sense organ; likewise with other illusions of the *sopādhika*, "relational," type. But the entire causal nexus is subject to a sublation of the "snake-rope" (*nirupādhika*) sort.

THE "SUPPORT" AND "LOCUS" OF AN ILLUSION

One factor that is common to all illusions, whether relational or not, and indeed common to all cognitions, is the presence of a *real* "locus" and "support," *ālambana* (or, less ambiguously, "*adhiṣṭhāna*" and "*āśraya*").[41] This stands as an empirical generalization, and Padmapāda refutes a counterexample that purports to show that there are presentations that have no locus.[42] He also puts forth a linguistic argument in support of the claim: a judgment that expresses a sublational cognition invariably makes reference, at least implicitly, to a locus where the change occurs.[43]

Now in ordinary experience, the locus of the object of a cognition is either (a) external—a physical (*jaḍaka*) object—as exemplified in sensory cognitions, or (b) internal, as exemplified in dreams. Padmapāda in discussing dreams (as examples of illusion) says that he does not want to quibble over the terms '*antar*' and '*bahir*', "internal" and "external." Though he does view the self as internal, like dream objects and unlike physical things, his chief concern is to defend the position that—from the metaphysical perspective—the presentations both of dreams and of waking experiences have consciousness (*caitanya*) as their support (*āśraya*):

Even in the waking state [as well as in dreaming] the immediacy [of consciousness—"*aparokṣatā*"] that involves [external] objects is not to be distinguished from inner immediate experience (*anubhava*)—[at least not] according to [any] cognition that is valid—for they are presented in the same way. Thus an object even in the waking state is experienced invariably (*eva*) as intimately associated with inner immediate experience. Otherwise the presentation of the material world would be impossible. As a pot that is covered (*avaguṇṭhta*) by darkness is not presented [to cognition] without the [counter-]covering (*avaguṇṭhana*) of the light of a lamp, so it is here.[44]

From the metaphysical perspective, the Self, that is, Brahman, is the locus and support of *māyā* the cosmic illusion, and this reality (*pāramārthikatva*)

is thought to underlie every worldly appearance. Although the externality of the "locus" in waking experience is a dimension to be sublated, a real locus is said to remain even after the ultimate sublation. Padmapāda's stress on an invariable presence of an *adhiṣṭhāna* in all instances of cognition, to include the worst illusions, is married to his view of Brahman as the "ground" of all phenomena and their "material cause."[45]

In this way, Padmapāda presents his understanding of the central doctrine of Advaita, namely, the identity of the self with Brahman. And indeed the famous *ātman-brahman* equation of the Upanishads appears to be understood similarly throughout Advaita, that is, with the *brahman*-factor understood as the "ground" or "locus" of all phenomena.[46] The connotations of the terms used in the passage just translated reinforce the stress on the idea that all cognitions involve a locus: both darkness and light are thought of as "coverings" (*avaguṅṭhana*). Everything "objective" except the locus and support in all cognitions is similarly a matter of "covering" and can be removed in a sublational experience of the snake-rope sort—so that only the bare "locus" and "inner immediate experience" would remain.[47]

Padmapāda does not present an empirical argument for the ultimate identity of all objects with a single locus-support—namely Brahman—and relies instead on *śruti* "scripture." But he does argue defensively, pointing out that because dream and external objects are presented in the same way[48] there is no reason (*pramāṇa*) to believe that external appearances have anything other than the self for their locus-support.[49] Thus his point is that this ultimate identity is *possible*.[50]

A SUMMARY AND AN APPRAISAL

We have seen that Padmapāda distinguishes two kinds of illusion and that it is only the relationless ("snake-rope") sort that is the proper analogue for the "relation" between Brahman and one's experience of the everyday world. In this final section, I want to focus on the metaphysics and in particular on Padmapāda's use of an illusion analogy to explain the relation (or nonrelation) of Brahman, the Absolute, to *māyā*, the cosmic illusion. I shall also say a word about what appears to be wrong with his theory.

The central conception—what makes this "illusionist" world view click in Padmapāda's mind and provides the key to its structure—is, I believe, the notion that everything except the self (or cognition itself) is a candidate for sublation (*bādha*) within the invariable presentation of a "locus"—in other words, that only the self is not a candidate for the sort of change in the phenomenal character of experience that occurs when one ceases to see the snake and sees instead the rope as it is.[51] The notion that only (a) the self and (b) the locus-support of a cognition (the two are thought to be identical) are unsublatable is the linchpin of the system. To change metaphors, it is this idea that undergirds the remarkable statement of Śaṅkara's that perception and all the other *pramāṇa*-s, "means of knowledge," including scripture (*śāstra*), are dependent on the presence of *avidyā*, "nonawareness [of oneself as Brahman]";[52] that is to say, their operation presupposes the condition of *māyā*. This statement is remarkable, and a *fortiori* Padmapāda's embrace of it, because of Śaṅkara's concern with giving reasons (that is, "*pramāṇa*") for his views, a concern that Padmapāda expands a thousandfold. How can a view be rational that purports to transcend the canons of rationality—or criteria for warranted belief—including, to be sure, scripture?

Now the topic of the foundations of the Advaita world view, whether scriptural revelation, reason, mystical experience, or some combination of these, has been amply discussed in recent, and not so recent, scholarly literature, both in the West and in India.[53] My intention is not so much to contribute further reflection on this topic, though, as I have said, I shall not hold back my opinion about the merits of Padmapāda's theory, but to question whether the ideas about sublatability really show the possibility of a single Self excluding the world, as Padmapāda claims.

First let us summarize his most abstract positions. The Advaita doctrine championed by Padmapāda is that everything except the self-luminous character of the self, its intrinsic awareness of itself as aware (*svayamprakāśamāna*), is sublated—within the invariable "locus"—in the ultimate "knowledge" (*vidyā*), even the phenomena of thought processes, emotions, and desires, even the profound mystical appearance of an *īśvara*, "God."[54] Unlike Vācaspati, who holds that Brahman always carries within its supreme self at least the "potencies" of world forms,[55] Padmapāda holds —in consonance with his idea of *mukti*—that the ontic status of the world is

simply that it does not exist; it is only *māyā*, like the illusory snake.[56] All appearances of "otherness," including that of an *īśvara*, similarly are not veridical; there absolutely are no other things than Brahman, the Self. This radical "illusionism" is the distinguishing mark of Padmapāda's interpretation of Śaṅkara.

I admit that he also gives, as Karl Potter points out,[57] an interesting cosmology and theory of how Brahman comes to appear as *māyā*, and this involves both a notion of an *īśvara* and the concession that it is Brahman itself that suffers *avidyā*, "nescience."[58] Prakāśātman takes this theory as the point of departure for his own much more realistic view of world appearance. But the passage in the *Pañcapādikā* presenting these ideas is exceedingly brief and, in effect, a digression.[59] Moreover, as Prakāśātman *rightly* explains, the key idea in this regard is that Brahman can undergo the sort of change that is typical of *illusory* presentations without relinquishing its native state.[60] The way that the passage (*Ppk* 98–99) connects with the main line of thought reinforces this emphasis: near the end it is proclaimed that "ego-sense" (*ahaṃkṛa*, which is said to be foundational for much appearance) is illusion only, and an analogy to the illusion of a red crystal is made. Now the red-crystal illusion is "relational," and correspondingly Padmapāda holds that ego-sense is related to a more primal "nescience," *avidyā*. The point is that what then follows is further discussion of relationless illusion as the way to understand *avidyā*. Finally, the ontic status of *avidyā* is declared to be, as already noted, illusion alone. This means that it exists as long as one is caught up in it. But with liberation, it disappears.[61]

The metaphysics is thus a radical "illusionism," and the quasi-theistic cosmology bound up with the notions of "*jñānaśaki*" and "*kriyāśakti*" Brahman's powers of knowledge and (creative) action, would be better attributed to Prakāśātman, the preeminent "Vivartavādin."[62]

Let us return now to the question of whether Padmapāda demonstrates the possibility of this "Brahman." The idea that the self and the locus-support are unsublatable while everything else is—conceived on analogy to the relationless sort of everyday illusion—is supposed to secure the possibility (*sambhava*) of the single and absolute reality of Brahman excluding the world. Scripture (*śruti*) indicates that the possibility is actual; or at least, this is the official position of both Śaṅkara and Padmapāda. Both

of the Advaitins also appear to hold that a mystical experience (*brahmasākṣātkāra*)—revealing *brahman* as sense experience reveals everyday objects—is the theory's consummation, and even "confirmation"; thus unofficially and in a peculiar way both appear to believe that there is mystic "evidence" for the theory.[63] In any case, the possibility of the truth of the metaphysics is to be secured by the ideas about sublatability, and the truth itself by scripture or extraordinary experience. The prior question is then whether these ideas do their job.

Now insofar as Padmapāda is correct in understanding the snake-rope type of illusion to be "relationless," he would be able, first of all, to maintain a pure phenomenalism on the criterion issue—at least at its highest level (*pāramārthikasat*) —and exclude causal factors. Without relations (other than the identity relation exemplified in the proposition that *ātman* is *brahman*), there can be no basis for the discernment of causal factors conditioning the veridicality of an immediate (mystical) presentation, in the imagined experience of "*mukti*."

Similarly, there would be no basis for a supposition of "otherness," since this would require a presentation of things in a relation other than that of identity. Indeed, the claim about possibility is very strong. It is, again, that on analogy to the type of sublation that occurs when the snake is seen to be not the rope it was formerly taken to be, it becomes imaginable—however remotely—that I am deluded right now and that *nothing* that I take to be real on the basis of my present experience (the chair here, the piece of paper, and so forth) is indeed real, except my own subjectivity. With all candidates that involve relations excluded, the only thing not possibly sublated would be the subject's immediate and unreflective awareness of itself (*svayamprakāśamāna*). The snake-rope type of sublation is taken to show that it is possible that some future experience of my own could reveal the illusoriness of *everything* in my present experience, except that dimension which is the awareness's awareness of itself including, to be sure, the presentation of a real thing as its "support."[64]

But, let us ask, is there not in the sublational cognition revealing the rope a presentation of relations among things—between the rope and our bodies, for example? The rope is useful and would not bite were we to pick it up. Padmapāda himself responds to a similar question.[65] He tells us not to take the specific analogy too seriously. Of course, he has to have an analogy, otherwise he would have no argument and no demonstration that the

identity of the self with Brahman excluding the world is possible. So he offers us another analogy: space and the space inside a pot. There are in reality no relations (other than identity) obtaining between universal space and the space that we arbitrarily delimit as that inside a pot.[66] This analogy is taken to illustrate the idea that any presumption, and perception, of things *in relation* could be false (*mithyā*). And I must say that I see no reason why we should not agree. The chief difficulty I find is not that all presentation of relation *could* appear to be negated experientially, but that the austere self-experience that he imagines could not. Let me explain.

The polemics of sublatability are very profound. In modern Western thought, this has been brought out by Descartes and his thought experiment of possible deception by a devil. He imagines, that is, deems it possible, that a devil could be deceiving him with illusory sense presentations. (Nowadays philosophers bring out the same idea with talk of "experience tanks" or the like: "Superduper neuropsychologists could stimulate your brain so that you would think and feel you were writing a great novel, or making a friend, or reading an interesting book. All the time you would be floating in a tank, with electrodes attached to your brain."[67]) Padmapāda's illustrations do not appear to me to be as vivid as Descartes', but this hardly matters. He has a similar argument. What presentation of experience could not possibly be sublated, as an illusory appearance of silver by a veridical appearance of mother-of-pearl, by some further experience? In respect to what dimension of experience is it *impossible* to imagine that one is deceived? Surely not any particular presentation of things in relation. Is it not imaginable that there be a cognition that involves a self-awareness but not anything external to oneself? (Yogic trance, or "deep sleep," might be an example of this.)

As I see it, the problem is not with imagining an apparent disappearance of the external world in a cognition of "self-absorption," but with the notion that the self-absorption is unsublatable.

One of Padmapāda's great themes is, as we have seen, the unity of cognition. It is evident in his notion of "memory-impregnated" cognitions, which we reviewed, and in many other details of his theory of experience. His claim is that there is a possibility of a cognition that is unitary to the ultimate degree. What would it be like? It would be the barest bones of a cognition. It would be an awareness of itself and a sense of its own reality as its own "locus" and "support." I find all these ideas intelligible and this

state of "*mukti*" imaginable—so long as the conception is restricted to the psychological and no notion of *brahman* is implied. More about this in a moment. But if one could "pop" into this supreme self-absorption, why couldn't one also pop out? There is no end to the regress of possibilities of experiential sublation.

Padmapāda takes the unsublatability of the self to show the possibility of a true ultimacy of experience. But the idea shows only the trap of the "solipsistic" ultimacy[68] of an extreme and "one-dimensional" phenomenalism. The metaphysics would hoist itself by its own petard: the very logic of sublatability requires that in the negation of world appearance in a unitary cognition of self all means of knowledge (*pramāṅa*) would be inoperative. The picture is thus a potent trap.

Does the objection that hinges on the sublatability of "self-absorption" presuppose a view of temporal relations among cognitive moments, in that it is thought that a further sublational cognition could *follow* the salvific experience? Yes, it does. Well, the salvific experience is presumed to transcend temporal relations, and thus the objection is not cogent. No, it is cogent. Every dimension of everyday experience that is imaginable as sublatable in the supreme self-absorption is also imaginable as again present in some ensuing experience—imaginable not, to be sure, on the part of the "liberated" person, but on all our parts. Neither Padmapāda nor any of his commentators, so far as I am aware, considers this point—absorbed as they are in the *picture* of self-absorption.

But has not Padmapāda identified factors that are *essential* to all cognition, namely, self-awareness and the presentation of a locus, and would not a cognition limited to these essentials thus indeed be a stop in the regress of sublatability? No. Often we are absorbed in objective presentations, and have no awareness of ourselves. Also, our everyday self-understanding is far richer than that which is reflected in Padmapāda's notion of intrinsic self-illumination. All that Padmapāda has shown is that we are potentially self-aware at any moment, or perhaps that there is no possibility of any other type of awareness without this potentiality of self-awareness (the central doctrine of Kants *Critique of Pure Reason*, according to some interpreters). The self may be self-illuminating, *svayamprakāśamāna*.[69] And the potentiality of this profound intuition of self may be as constant as the Advaitins think it is. But there is nothing in the idea that suggests that such an intuition could not be followed by a

fuller experience of self—such as we have of our own bodies and our "being-in-the-world." Thus there is no reason to suppose that a cognition that has only itself as its object as well as its "locus" and "support" is not also a candidate for sublation. This is the fundamental failure of the theory.[70]

There is also an equally grievous instance of incoherence, related to this phenomenological misconception. Padmapāda's notion of the unity of the self and Brahman believed to be evident in a mystical experience is unintelligible, that is, *not* imaginable, because Brahman is considered the *adhiṣṭhāna* and *āśraya*, "locus" and "support," of *all* things. In other words, Padmapāda cannot show that a cognition of the self and Brahman negating the world is possible because Brahman is conceived as the locus-support of all worldly things. For *Brahman* to be presented as identical with a state of self-absorption would require some kind of reference to worldly things, and in the state of *mukti* as Padmapāda conceives it there is none such. Thus we can construct a "pragmatist" objection (invoking the tradition of Dharmakīrti and others) that would run as follows. With everyday illusions, even of the radical "relationless" sort—best exemplified, I would say, not in a snake-rope sublation but in waking from a vivid dream—a judgment of illusoriness can be secured only by an experience involving interaction or interrelation. Since there is imagined no interaction or interrelation in the state of self-absorption, it is unimaginable that Brahman, by definition the locus-support of all things, could be revealed therein. Thus Padmapāda must needs fail in his attempt to show that a cognition revealing all things to be *māyāyika* could occur.

NOTES

1. In developing an illusionist metaphysics and soteriology, the Advaitins draw deep from a common well of Indian religious conceptions. See the *Majjhima-Nikāya*, Sutta 26, for an example in the Buddhist tradition—outside Vedāntic "scriptures." Then for an early and particularly striking example within Vedānta, see *Bṛhadāraṅyaka Upaniṣad* 4.3.9–22.

2. *Brahmasūtrabhāṣya* (hereafter cited as *BSB*), in *Brahmasūtra-Śāṅkarabhāṣyam*, ed. J. L. Shastri (Delhi: Motilal Banarsidass, 1980; originally published (2d ed.) Bombay: Nimaya Sagar, 1909), 1.1.1, pp. 4–9.

3. The choice of the term '*adhyāsa*,' "superimposition," to designate illusions reflects Śaṅkara's metaphysical views. Illusions are more neutrally referred to as "*viparyaya*" and "*bhrānti*." (Later, in fact (*BSB* 1.1.4, p. 69), Śaṅkara uses the term '*bhrānti*': "*sarpabhrānti*," "the illusion of the snake.")

4. E.g., *Upadeśasāhasrī* 2.2.51–55 (in the translation by Sengaku Mayeda, *A Thousand Teachings* (Tokyo: University of Tokyo, 1979), pp. 235–236.)

5. *BSB* 1.1.1: *sarvathā api tu ... na vyabhicarati*.

6. N. K. Devaraja, in *An Introduction to Śaṅkara's Theory of Knowledge* (Delhi: Motilal Banarsidass, 1962), is able to present Śaṅkara's views as an intricate epistemological system because he expounds the opinions of a whole host of Śaṅkara's followers—while not always crediting their originality and overvaunting the achievements of Advaita's "founder." Some others do this as well, apparently following the tradition among the classical thinkers of all schools of achronistically attributing sophisticated positions to the earliest documents, and in particular to the "sūtras," of each school. Of course, there has appeared a considerable amount of excellent scholarship on Śaṅkara, including in part, to be sure, this book of Devaraja's.

7. Because of the enormous popularity of the *Vedāntaparibhāṣā*, its author Dharmarājādhvarīndra must be viewed as the preeminent systematizer of Advaita epistemology, although it may be, as Surendranath Dasgupta claims in the "Forward" to Swami Madhavananda's edition (Howrah: Ramakrishna Mission, 1972), that he is heavily dependent upon Rāmādvaya's *Vedānta Kaumudī*. Cf. Dasgupta's discussion in his *A History of Indian Philosophy*, vol. 2 (Delhi; Motilal Banarsidass, 1975), pp. 204–214.

Note that in the introductory verses Dharmarājādhvarīndra does say that philosophy should be concerned with the *paramapuruṣârtha*. He also elaborates the idea in his book's last chapter. Nevertheless, the book is dominated by epistemological concerns, not soteriological ones.

8. See, for example, *Vedāntaparibhāṣā* 1.55. Note further what Karl Potter says in the "Introduction" to the volume of *The Encyclopedia of Indian Philosophies* (Delhi: Motilal Banarsidass, 1981) devoted to Advaita Vedānta (vol. 3): "It is Padmapāda who pioneers the epistemology we … associate with Advaita. He provides the bridge between Śaṅkara and later Advaita, which is obsessed with epistemology as Śaṅkara was with the contrast between knowledge and action" (p. 73). Also interesting is Paul Hacker's general statement on Padmapāda's originality: "Im ganzen können wir sagen, dass Padmapāda ein schlechter Kommentator, dafür aber ein um so selbständigerer Denker ist" (*Untersuchungen über Texte des frühen Advaitavāda: l. Die Schüler Śaṅkaras* (Wiesbaden: Akademie der Wissenschaften und der Literatur in Mainz, Abhandlungen der geistes- und sozialwissenschaftlichen Klasse 1950, no. 26), p. 27).

9. Viz., *Sarvadarśanasaṃgraha*. Note that Mādhava's *Vivaraṇaprameyasāmgraha* has been translated by S. S. Suryanarayana Sastri and Saileswar Sen, Andhra University Series, no. 24 (1941), and they attribute it to "Bhāratītīrtha."

10. See E. P. Radhakrishnan, "The Pañcapādikā Literature," *Poona Orientalist* 6 (1941–1942): 57–73.

11. E.g., ibid., pp. 58–59.

12. Prakāśātman has a "tiered" ontology, and views the sublation of world appearance in Brahman-experience as showing that the world has no absolute reality but not—as Padmapāda holds—as involving its disappearance; see the final section of this article. Note that Prakāśātman's *Vivaraṇa* stands in a complex relation to Padmapāda's work, and it is far from a sentence-by-sentence gloss.

14. There have been, however, some notable efforts in Padmapāda scholarship. Many of the general historians of Indian philosophy have given serious attention to the Advaitin. For example,

Surendranath Dasgupta claims to base his exposition of Śaṅkara's views in volume 1 of *A History of Indian Philosophy* (Cambridge: Cambridge University Press, 1969) on Padmapāda's and Prakāśātman's commentaries. Also, Karl Potter often refers to Padmapāda's views in his long introduction to the Advaita volume of *The Encyclopedia of Indian Philosophies*. He also provides there a thirty-odd page summary of Padmapāda's major work, the *Pañcapādikā*. The most significant contribution in English to scholarship on Padmapāda is D. Venkataramiah's translation of the *Pañcapādikā*, Gaekwad's Oriental Series, vol. 107 (Baroda: Baroda Oriental Institute, 1948), along with the accompanying notes. Venkataramiah's notes often elucidate obscure passage, but sometimes they reflect the views of later Advaitins who are unacknowledged. They also suffer, as does the translation, from Venkataramiah's lack of command of the technical philosophical vocabulary in English. (Potter's summary on this score represents a great advance.)

But despite these works, Padmapāda has not received the attention he deserves. As Karl Potter's bibliography shows, Advaita scholarship has focused principally on Śaṅkara, with Padmapāda enjoying about one percent of the amount of attention that his teacher has received: *The Encyclopedia of Indian Philosophies*, rev. ed. (Delhi: Motilal Banarsidass, 1980), vol. 1, lists more than four hundred secondary works on Śaṅkara, while only seven pieces are listed for Padmapāda. Let me add that there is good German scholarship on Padmapāda, and on Prakāśātman: most notably, Paul Hacker's *Untersuchungen über Texte des frühen Advaitavāda*, pp. 1927–1933 and 2014–2061, and *Vivarta* (Wiesbaden: Akademie der Wissenschaften und der Literatur in Mainz, Abhandlungen der geistesund sozialwissenschaftlichen Klasse 1953, no. 5), pp. 36–41; and Klaus Cammann, *Das System des Advaita nach der Lehre Prakāśātmans* (Wiesbaden: Harrassowitz, 1965).

15. The *Pañcapādikā*, ed. S. Srirama Sastri and S. R. Krishnamurti Sastri, Madras Government Oriental Series 155 (1958), part 1, hereafter cited as *Ppk*.

16. *BSB* 1.1.1 : *ko 'yam adhyāso ... smṛtirūpaḥ paratra pūrvadṛṣṭâvabhāsaḥ*.

17. *BSB* 1.1.1 : *anyasya anyadharmâvabhāsatām*.

18. Viz., by Prakāśātman in his *Vivaraṅa*, which comprises part 2 of Madras Government Oriental Series 155 (p. 129), and by Ātmasvarūpa and Vijñānātman, MGOS 155, pt. 1, pp. 41 ff.

19. Padmapāda does not identify his opponents by name. Venkataramiah attributes the view to the Mīmāṃsaka Prabhākara (p. 19). It seems likely that Padmapāda had a direct familiarity with Prabhākara, although at least here he does not assume any special understanding of the views that he refutes. In fact, the three opposing views that he takes up are just those that Śaṅkara mentions in giving his "minimalist" characterization.

Prabhākara's view, by the way, is, as noted, also referred to as *a(viveka)khyātivāda*—and rightly so, since as we shall see, a "failure to distinguish" memory from sensory cognitions is one element crucial to the theory.

20. *anyasamprayukle cakṣuṣy anyaviṣayajñānaṃ smṛtir eva, pramoṣas tu smaraṅâbhimānasya. indriyâdīnāṃ jñānakāraṅānāṃ kenacid eva doṣaviśeṣeṅa kasyacid eva arthaviśeṣasya smṛtisamudbodhaḥ kriyaie. samprayuktasya ca doṣeṅa viśeṣapratibhāsahetutvaṃ karaṅasya vihanyate. tena darśanasmaraṅayoḥ nirantarôtpannayoḥ karaṅadoṣād eva vivekânavadhāraṅād dūrasthayor iva vanaspatyoḥ anutpanne eva ekatvâvabhāse utpannabhramaḥ* (*Ppk* 42–43).

21. *Ppk* 51 and 55; cf. *Ppk* 40.

22. *Ppk* 46.

23. *Ppk* 45.

24. *Ppk* 45.

25. *Ppk* 47.

26. *dṛṣyate ... liṅgajñānasaṃskārayoḥ liṅgijñānôtpādanam, pratyabhijñānôtpādanaṃ ca akṣasaṃskārayoḥ. ubhayatra api smṛtigarbham ekam eva pramāṅajñānam. saṃskārânudbodhe tadabhāvāt na punaḥ jñānadvaye pramāṅam asti* (*Ppk* 53).

27. But see *Ppk* 52.

28. *Ppk* 51 ff and many other places.

29. See note 41 following on the ambiguity in these terms.

30. Venkataramiah attributes this view to the Naiyāyikas (p. 25), but it appears to originate with Dharmakīrti. See Masatoshi Nagatomi in "Arthakriyā," *Adyar Library Bulletin* 31–32 (1967–1968): 52–72, who identifies both senses of the term in Dharmakīrti's writing.

31. A favorable comparison to such twentieth-century Western philoso/philosophers as John Dewey and W. V. Quine might be made in regard to their criticism of the phenomenalism of Berkeley and Hume.

32. *Ppk* 48.

33. Although there is a difference in connotation, the terms '*māyā*' and '*vyavahāra*' are used synonymously by Padmapāda, as by most Advaitins.

34. *Ppk* 98–113.

35. Padmapāda many times says explicitly that causes may be inferred from effects, e.g., in *Ppk* 51. Note that it was again Dharmakīrti who brought out to the Indian philosophic community the causal underpinnings of many inferences. It is because fire is the cause of smoke, necessary to its presence, that one may reason validly from the premise that there is smoke on the mountain to the conclusion that there is fire there too.

36. Śaṅkara says at *BSB* 1.3.20 that perception (*pratyakṣa*) is independent in its operation, while the other *pramāṇa*-s, in particular inference (*anumāna*), are dependent on perception. Padmapāda's commentary does not extend as far as this passage, but there is no reason to believe that he does not also see perception as having this privileged "foundational" status. Indeed, his phenomenalism with respect to the ultimately real dovetails with this position. But I have found no explicit statement in a passage that is clearly not a "*pūrvapakṣa*."

37. *Ppk* 70–71 and 98 ff.

38. Padmapāda does not use the word '*upādhi*' here, but he does use '*upadhāna*' (*Ppk* 102), a word that derives from the same verbal root, '*dhā*'. (The commentators prefer the former term, possibly through the influence of the Naiyāyikas, and interpret the two terms as virtual synonyms.) Also, and this is the important exegetical point, Padmapāda clearly expresses the idea of conditioning relations. Often he does so through forms of the verb '*apekṣ*', e.g., in *Ppk* 54–55. In this passage (*Ppk* 54–55) and later in expositing the metaphysics of the self (*Ppk* 112–113), he pellucidly expresses the idea of "relationless" sublation. (Note that Śaṅkara himself uses the term '*nirupādhi*' in this sense, e.g., in *Muṇḍakôpaniṣadbhāṣya* 2.2.4.)

39. *Ppk* 54 (reading '*āloka*' for the misprint '*aloka*': when "light" is absent one cannot see an object that is present).

40. Padmapāda's clearest statement of the mechanics of perception occurs at *Ppk* 114–117. Here we may note that Sengaku Mayeda's paper, "The Advaita Theory of Perception," *Wiener Zeitschrift für die Kunde Südasiens und Archiv für Indische Philosophie* 12–13 (1968–1969): 221–240, is an excellent reconstruction of the Advaita psychology (as opposed to epistemology and phenomenology) of perception, although he too concentrates on Śaṅkara's views somewhat at the expense of the more developed theory in later Advaita.

41. *Ppk* 52: *mithyâlambanaṃ jñānaṃ mithyājñānam*, "An illusory cognition is a cognition that has an illusory object." Thus one might think that the term *ālambana* invariably means "presented object," and would refer to that which the presentation ('*avabhāsa*' or *prakāśa*) would be *of*. But Padmapāda sometimes uses the term to mean "locus" and "support" instead. Two other terms used regularly, '*viṣaya*' and '*artha*', have potentially the same ambiguity.

42. *Ppk* 63.

43. *Ppk* 64–65.

44. *jāgaraṇe 'pi pramāṇajñānād antaraparokṣânubhavāt na viṣayasthā aparokṣatā bhidyate, ekarūpaprakāśanāt. ato 'ntaraparokṣânubhavâvaguṇṭhita eva jāgaraṇe 'py artho 'nubhūyate.*

anyathā jaḍasya prakāśânupapatteḥ. yathā tamasā 'vaguṅṭhito ghaṭaḥ pradīpaprabhâvaguṅṭhanam antareṅa na prakāśībhavati, evam (*Ppk* 57–58).

45. Doubtless, some of this emphasis is due to Padmapāda's desire to refute the Mādhyamika Buddhists. These so-called "nihilists" hold that there is no ultimate support for appearances: the self is really *śūnya*, "nothing." To contradict this view Śaṅkara uses the term '*paratra*', "in something else," in characterizing illusion, Padmapāda says. The first time he stresses the necessity of an *adhiṣṭhāna* is in this context (*Ppk* 61–68), but he stresses it in the later talk about Brahman as well. See *Ppk* 139 ff.

46. The identity statement would not be analytic or epistemically necessary, but synthetic and metaphysically necessary—to use the terms elucidated by Saul Kripke, in *Naming and Necessity* (Cambridge, Massachusetts: Harvard, 1980), Lecture I. Cf. Karl Potter's discussion of the identity statement, in *Encyclopedia of Indian Philosophies*, vol. 3, p. 73, and Wilhelm Halbfass, *Studies in Kumārda und Śaṅkara* (Rienbek: Wezler, 1983), pp. 54–60.

47. Sometimes it seems to me that this is a metaphysics of the locative case. Note that Śaṅkara's use of '*paratra*' in his first characterization of *adhyāsa* is brilliantly suggestive: the "something else" which the illusory object appears *in* is—from the metaphysical perspective—Brahman, and '*paratra*', like all forms of '*para*', has the connotation of "supreme, highest, preeminent" as well as "remote" and "beyond."

48. But are they? Dreams do not exhibit the same degree of continuity as waking experiences. Moreover, the only way we know (or could know) that dream objects have the self as their locus-support is *with reference to* waking experiences. The fact that Padmapāda misses these points is another indication of his radical (and misguided, as I shall show) phenomenalism on the issue of the criterion of the ultimately real.

49. *Ppk* 57.

50. We can understand now why Padmapāda feels no need to use different terms for (a) the presentational object of a cognition (e.g., silver) and (b) the locus and support of a cognition (e.g., mother-of-pearl): these are ultimately identical. We remarked that the terms '*ālambana*', '*artha*', and '*viṣaya*' are all used in both senses—see note 41 preceding.

51. Śaṅkara expresses the idea of the unsublatability of the self, although not so clearly as Padmapāda, in *BSB* 1.1.1: *aparokṣatvāc ca pratyagātmaprasiddheḥ*; and (much more explicitly) in *Aitareyôpaniṣadbhāṣya*, introduction (*Ten Principal Upanishads with Śāṅkarabhāṣya* (Delhi: Motilal Banarsidass, 1978), p. 325): *utpannasya ca brahmâtmavijñānasy a abādhyamānatvāt*. It is also implicit in the *Bṛhadāraṅyaka Upaniṣād*, 4.3.23–31. Padmapāda presents the idea many times, e.g., in *Ppk* 52: *na svataḥ jñānasya mithyātvam asti, bādhâbhāvāt*. See also in particular *Ppk* 65–66.

52. *BSB* 1.1.1: *avidyāvadviṣayāṅy eva pratyakṣâdīni pramāṅi śāstrāṅi ca*. See also *BSB* 4.1.3: *pratyakṣâdyabhāve śruter apy 'bhāvaprasaṅga iti cet; na, iṣṭatvāt*.

53. Ram Mohan Roy's championing of the rationality of Śaṅkara's Vedānta in the early nineteenth century launched a series of similar defenses in India. See Wilhelm Halbfass, *Indien und Europa* (Basel: Schwabe, 1981), chap. 12, and his later extensive discussion of the entire issue of reason and revelation in the philosophy of Śaṅkara, *Studies in Kumārila and Śaṅkara*, pp. 27–84.

54. *Ppk* 286–288.

55. *Bhāmatī* 1.3.30, in *Brahmasūtra-Śāṅkārabhāṣyam*, pp. 261–264. Note that Srirama Sastri in his Preface to vol. 155 of the Madras Government Oriental Series (in which the *Ppk* appears along with seven commentaries), lists ten principal differences between Padmapāda's and Vācaspati's philosophies, but he neglects this one (pp. xvii–xix). And it should count, I would say, at least in the top three.

56. There are ample indications of both views in Śaṅkara's works. The reason that Padmapāda's teacher makes cosmological statements that spark Vācaspati's interpretation is that he is committed to an idea of invariable perfection for *śruti* from a world-bound perspective. Of course, he nonetheless

believes that *śruti*, like everything that is inessential to the self, belongs to the province of *māyā*. See *BSB* 1.3.30.

57. *Encyclopedia of indian Philosophies*, vol. 3, p. 86.

58. *Ppk* 98–99; and 74: *anādisiddhâvidyâvacchinnânantajīvanirbhāsâspadam ekarasaṃ brahma*.

59. *Ppk* 98–99.

60. *Vivaraṅa*, pp. 653–657. This passage is Prakāśātman's commentary on Padmapāda's understanding of Sūtra 1.1.2 ("[Brahman is that] from which the beginning, etc. of this (world proceeds]") expressed at *Ppk* 300: "*viśva vivartate*." José Pereira has translated this section in *Hindu Theology: A Reader* (New York: Doubleday, 1976), pp. 201–206.

Let me repeat that the idea of "transmogrification" (Pereira's coinage for '*vivarta*')—contrasting with "transfiguration" (*pariṅāma*)—is not pronounced in the *Ppk*. However, that Padmapāda is thinking of Brahman as not losing its native state when he says here (*Ppk* 300) that it is the "root cause" is likely: "*yadavaṣṭambho viśvo vivartate prapañcaḥ tad eva mūlakātaṅaṃ brahma*"—"having this as its support all world appearance unrolls, this alone, the root cause, is Brahman." Nevertheless, the key ideas are "*avaṣṭambha*" and "mūlakāraṅa" not that expressed by the verb '*vivartate*'—whose grammatical subject, moreover, is not "*brahma*' but '*prapañca*', "world appearance." (Cf. *Ppk* 56: … *aparokṣacaiianyasthâvidyāśaktir ālambanatayā vivartate*, "the power of '*nescience*' stationed in immediate awareness 'transmogrifies' as objects.")

Let me add that I find Prakāśātman's ideas here of particular interest, since it is on the issue of whether Brahman "transfigures" and/or "transmogrifies" that Aurobindo, that premier mystic Brahmavādin of our century, takes himself to depart from Śaṅkara. (I do not believe however that Aurobindo had a direct familiarity with Prakāśātman's work.) For Aurobindo's theory of Brahman's *real* "evolution" (and "involution") in world forms, see *The Life Divine* (Pondicherry: Sri Aurobindo Ashram Trust, 1973), pp. 295–321, 439–481, and 834–835. Cf. my "Aurobindo's Concept of Supermind," *International Philosophical Quarterly* 25, no. 4 (December 1985): 410–416, and my *Aurobindo's Philosophy of Brahman* (Leiden: Brill, 1986), pp. 124–131.

61. *Ppk* 66–67. An indication that Padmapāda does not take his own "cosmology" seriously is that in this passage (*Ppk* 66) he says that the occurrence of the cosmic illusion is "inexplicable," *anirvacanīya*.

62. Cf. Klaus Cammann's discussion, in *Das System*, pp. 124–128.

63. I discuss the implicit "mystic empiricism" of Śaṅkara and various "folk Vedāntins" in "Is Sri Aurobindo's Philosophy Vedānta?" *Adyar Library Bulletin* 48 (1984): 1–27, and in my book, *Aurobindo's Philosophy*, pp. 67–73.

Anantanand Rambachan has attempted to depreciate "experience" (*anubhava*) in Śaṅkara's soteriology and correspondingly to appreciate "scripture" or "revelation" (*śruti*). See "Śaṅkara's Rationale for Śruti as the Definitive Source of Brahmajñāna: A Refutation of some Contemporary Views," *Philosophy East and West* 36, no. 1 (January 1986): 25–40. Now *śruti* is indeed according to Śaṅkara an indispensable means both (1) to have a right intellectual understanding of the self and (2) to achieve an existential knowledge (*vidyā*) of *brahman*. But it is important to distinguish these and to see that the value of the intellectual knowledge is thought of as only instrumental, as deriving from its role in the attainment of *brahmasākṣātkāra*, "immediate *brahman*-experience." The intellectual understanding brought by "scripture" does not, furthermore, appear to be the sole possessor of this instrumental value. Contrary to what Rambachan says, there often appear to be yogic "prerequisites" (*adhikāra*) as well, although Śaṅkara is not always consistent about these (see e.g., *Upadeśasāhasrī* 2.1.2, *Muṅḍakòpaniṣadbhāṣya* 3.1.1, 3.1.2, 3.2.4, *Kenôpaniṣadbhāṣya* 4.7, and *Taittirīyôpaniṣadbhāṣya* 3.1.1). Whatever be the precise list of *adhikāra*-s, understanding the words of the Upanishads is clearly held to be, though necessary, *not* sufficient. From Śaṅkara's *Muṅḍakôpaniṣadbhāṣya* 1.1.5: *vedaśabdena tu sarvatra śabdarāśir vivakṣitaḥ. śabdarāśyadhigame 'pi yatnântaram antareṅa gurvabhigamanâdilakṣaṅaṃ vairāgyaṃ ca na akṣarâdhigamaḥ*

sambhavati. But beyond this confusion of necessary and sufficient conditions, Rambachan's worst error is, I repeat, that he conflates the ideas of intellectual and existential understanding and fails to see that according to *śruti* as interpreted by Śaṅkara the liberating "knowledge" of Brahman is a "psychological event" (*anubhava*), not an "intellectual comprehension," (*śabdâdhigama*). See in particular *BSB* 1.1.2: *śrutyādayo 'nubhavâdayaś ca yathāsaṃbhavam iha pramāṅam, anubhavâvasānatvād bhūtavasluviṣayatvāc ca brahmajñānasya*. (The most significant use of '*anubhava*' here is not the first, on which Rambachan focuses, in pp. 35–36, but the second.) Rambachan says that experience is not a *pramāṅa* for knowing *brahman*. In the intellectualist sense of "knowing," he is right. All *pramāṅa* give intellectual knowledge, *pramā*, and there is, according to Śaṅkara, no intellectual knowledge in the liberating experience. There can be no report of the experience of *brahman* since the liberated person is lost to the world (or more properly, the world is lost to him). Thus not any "mystic report" but, as Rambachan partly sees, only self-authenticating *śruti* teaches the essential nature of the self and *mukti*. But it is an austere "self-experience" that is most highly valued, not *śruti*. Moreover, this "experience" is conceptualized in such a way that the world, including *śruti, has to be māyā*. (The inference is drawn according to the understanding of everyday illusion.) See the *BSB* citations in note 52 preceding, and Śaṅkara's *Bṛhadāraṅyakôpaniṣadbhāṣya* 2.1.20: *ekasmin brahmaṅi nirupādhike na upadeśo na upadeṣṭā na ca upadeśagrahaṅaphalam. tasmād upaniṣadāṃ ca anarthakyam iti etad upagatam eva*. The official epistemology is surely anti-empiricist, even anti-mystic-empiricist, but not only does Śaṅkara believe that a living *mukti* is a real possibility for a person and from that perspective "virtual evidence"; the *logic of his metaphysics* is governed by a complex analogy to everyday experience, veridical and illusory. See the *BSB* citation in the following note (note 64) as another expression of this governing analogy.

64. Brahman thus includes both intrinsic self-awareness and all reality—in that it is that which underlies all worldly things. This is an extremely important point. The reason that there can be salvific Brahman-experience is that Brahman is real, the Advaitins hold, just as the knowledge mediated by the senses is dependent on real things. Śaṅkara says this explicitly at *Brahmasūtrabhāṣya* 1.1.4: *brahmavidyā ... pratyakṣâdipramāṅaviṣayavastujñānavad vastutantrā*, "Knowledge (*vidyā*) of *brahman* is dependent on a real thing, like the knowledge of the real things that are the objects of such means of knowledge as sense experience."

65. *Ppk* 111–113.

66. This appears to be the same type of phenomenon as that brought out by the "duck-rabbit" pattern popularized by Wittgenstein, in *Philosophical Investigations* (New York: Macmillan, 1953), p. 194.

67. Robert Nozick, *Anarchy, State, and Utopia* (New York: Basic Books, 1974), p. 42.

68. Cf. Paul Hacker, "Die Idee der Person im Denken von Vedānta-Philosophen," in *Kleine Schriften* (Wiesbaden: F. Steiner, 1978), pp. 280–281.

69. The idea is that we can be aware of ourselves directly, without mentally reflecting on the fact of our existence; the self is "irreflexively self-illuminating." Compare M. Merleau-Ponty's understanding of the Cartesian "*cogito*" in *Phenomenology of Perception*, trans. Colin Smith (London: Routledge & Keagan Paul: 1962), pp. 369 if. Paul Hacker illumines the Vedāntic idea in numerous articles; see for example "Śaṅkara der Yogin und Śaṅkara der Advaitin" and "Śaṅkara's Conception of Man," republished in his *Kleine Schriften*. Cf. Aurobindo's notion "knowledge by identity," in *The Life Divine*, pp. 524–552, and my book, *Aurobindo's Philosophy*, pp. 103, 117, and 124.

70. The failure is particularly evident in the obscurity of the notion of "*jīvanmukti*" "liberation while alive." Cf. Potter's discussion of the notion, in *Encyclopedia of Indian Philosophies*, vol. 3, pp. 34–35: "The *jīvanmukti* state seems paradoxical" (p. 34). Indeed, it is, if "living" is taken to involve conscious and willful activity and not just a comatose state.

DREAMS AND REALITY: THE ŚAṄKARITE CRITIQUE OF VIJÑĀNAVĀDA

Chakravarthi Ram Prasad

Department of Philosophy, National University of Singapore

In this essay, I concentrate on two significant passages in Śaṅkara's *Brahmasūtrabhāṣya:* (1) a few sentences from the introductory passage, and (2) his critique of Vijñānavāda. While I will not directly examine the classical Advaitic doctrine that Brahman alone is 'real', I hope to show that Śaṅkara adopts a sophisticated position on the nature of the ordinary world extrinsic to the subject of consciousness. This can be seen from a study of his analysis of the claim that dreams prompt suspicion about the nature of the world or, at any rate, the veridicality of our cognitive contact with it. The resultant position, which I characterize as 'nonrealism' regarding the world, is that while such a world must be accepted for the purpose of conventional knowledge, since it alone adequately explains the nature of our experience, there is nothing in our experience, and the reasoning based on it, that will enable us to say that the world which is experienced is the sole and determinate reality. Obviously, if there is no philosophical foundation to the idea that this world is the sole and determinate reality, there is at least a prima facie case for considering the soteriological possibility of Brahman-reality against which this world can be set as indeterminate in some significant way. I shall not pursue this soteriological claim because (a) much of the sustained argument for the plausibility of the indeterminacy of the world was done by Śaṅkara's successors, and (b) because I think that the soteriological argument is unpersuasive unless one is committed to some acceptance of Brahman (or indeed a Deity). I argue here that in his rejection of the Buddhist use of dreams and in his qualified acceptance of dreams himself, Śaṅkara provided us with sufficient material for an interesting reconstruction of the Advaitic philosophical position. The

aim of this essay is to use the material on the critique of Vijñānavāda to provide a Śaṅkarite reconstruction of the role of dreams in our understanding of the external world; I will not attempt to make this an exegesis of Śaṅkara. The interest lies, I think, in the way in which arguments rooted in a tradition can be developed with regard to contemporary themes in philosophy. I must emphasize at this stage itself that the Advaitic view which I present here is substantially at odds with the spirit of the subschool exemplified by Padmapāda and Sureśvara, which, on the basis of the philosophical positions I give here, may more properly be understood as being idealistic. My Advaitin is a reconstructed Śaṅkarite who owes a fair amount to the subschool represented by Vācaspati, and to the subtle skepticism of Śrī HarṢa.

This essay is broadly in three parts. In the first, I give an account of the way in which I view the *pramāṇa* theory, and I provide a few comments on my use of the idea of transcendental argument in the technical Kantian sense and on the use of basic terms. In the extended second part, I first reconstruct an Advaitic understanding of the conditions required for ordinary experience (or continuous cognition), and then examine the actual Buddhist position regarding dreams together with Śaṅkara's attack on it. In the final part, I speculate on a way in which the Advaitic acceptance of the role of dreams could be reconciled with the rejection of the Buddhist use in such a manner as to provide a rationale for the ultimate soteriological idea of the reality of Brahman.

I

1. The Pramāṇa Theory: A System of Validation. We must now set the scene for the Indian metaphysical project. The structure of the subject-object relationship is formed by the *pramāṇa* theory. The *pramāṇas* are the *means* of knowledge, and provide knowledge through such modes as perception, inference, and testimony. The objects of knowledge are called 'knowables' (*prameya*) and constitute the order extrinsic to congition. Finally, the cognitive act in which an object is grasped according to the authoritative means of knowledge is an episode of knowledge (*pramā*). It can be used to refer to both the true judgment that issues and the subject's entertainment of it, as a consequence of the proper use of the *pramāṇas*. The *pramā* may

thus be called a knowledge episode.[1] The importance of the *pramāṇas* lies, however, not just in the cataloging of the modes of gaining knowledge—perception, inference, testimony, and the like—but in the metaphysically vital double nature they possess. To gain knowledge is to use the *pramāṇas* properly; but usage is proper precisely due to the *pramāṇas* being the authoritative source of knowledge of the objects of knowledge (*prameyas*). If the cognition of a condition is veracious, the reason that the subject *gives* for holding that cognition as veracious will have to be just the legitimate reason the subject in fact *has*, that entitles the subject to so hold the claim, and which renders it true. Using the scalpel *properly* just is getting the *right* incision. In the *Citsukhī*,[2] it is claimed that when veracious awareness arises (*utpatti*), the totality of causal factors that generate knowledge will be the factors the subject appeals to in claiming knowledge. The Indian skeptic Jayarāśi[3] agrees that certain conditions determine whether a cognitive act is a knowledge episode. It must (I.11):

(i) be produced by faultless causal factors,[4] and

(ii) be free of contradiction.[5],[6]

He also accepts the further Nyāya definition[7] that

(iii) there must be activity (*pravṛtti*) that is efficient (*sāmarthyam*) in the attainment of a cognitive result (*phalam*).

Making use of Gilbert Harman's terms,[8] Matilal dubs this the 'cause/because' nature of the *pramāṇas*. It must be emphasized that this cause/ because formulation is not an attempt to combine Alvin Goldman's theory of knowledge[9] with Harman's theory of inference.[10] Briefly, Goldman's theory is that a judgment is true and delivers knowledge only if it was the object of the judgment which *caused* the cognition upon which the judgment is based. Harman's theory states that a judgment functions as a proper knowledge claim only if the subject can provide, through inference of the causal chain involved, the *justification* for that claim. The cause/because theory, however, should be seen as an attempt by the Indian philosophers to extract a metaphysical relationship between knower and known. The concept of the *pramāṇas* in this context should not be seen as a theory of inference, but as a transcendental argument about the condition required for knowledge (for a judgment to be true). It is not so much an explanation of how I can come to know as laying down what must be the case when I do.

In view of this understanding of the nature of the relationship between knower and known, we may say that the *pramāṇas* become the crux of two interdependent issues: the consistency of justificatory procedures ('because') and the metaphysical requirement ('cause') for the validity (*pramātva*) of such justification.

The relationship between the subject's incidence of knowledge (*pramā*) and its object (*prameya*) is therefore structured by the *pramāṇas*. That is to say, the Indian metaphysical project was conceived as an examination of how the *pramāṇas* literally held together the subject-object relation evidently presented in experience. An examination of what epistemic activity resulted from and in experience was an examination of the justification that was used for knowledge claims in that activity; and if the justification was to be held as successfully made, then that success would prove that knowledge 'worked', that indeed we had access to the objects of our epistemic activity. The idea is that any state of affairs can be established in knowledge only by the grasp of the instruments which render cognition of that state of affairs valid. The attainment of truth cannot be imagined to be anything other than a grasp of the justification conditions for the judgment, for what justifies that judgment is its being the case that the state of affairs is just as the judgment takes it to be. The *pramāṇa* theorists concluded, therefore, that if those conditions were known, that is, if the *pramāṇas* were established as delivering certainty (*nirnaya*), then the truth of the matter could be taken as established. The obvious objection is that one could conceive of coherent justification that would not deliver 'truth'. But that is to misunderstand the notion of the *pramāṇas*. According to the theorists, it is not enough merely to give reasons for holding a judgment in order for it to be true. The force of the point about justification and validity is this: suppose we stipulate that a given judgment be taken as true. Then, speaking from the point of view of epistemic access, if that judgment is entertained and the subject is taken as having knowledge, what else can the subject do to substantiate that claim but catalog the procedure by which such grasp was gained? From that it does not follow that giving justification is all of what knowledge consists in. But it can be said that knowledge consists in possessing a grasp of that set of factors which constitute the elements of the causal chain from object to cognition. That is why the *pramāṇas* are not only justification procedures but also those methods which match the causal chain with the justificatory ones, so as to validate

knowledge claims. The idea is that one cannot simply give a justification and leave it at that; that justification has to be the one that traces the path of contact between judgment and state of affairs but in reverse. We have, then, the Validation Thesis of the *pramāṇas* (Vp):

(Vp) The establishment of the instrumentality of the *pramāṇas* is possible in virtue of the authoritative source of the *pramāṇas*; therefore, the establishment of the instruments of knowledge establishes, for the users of these instruments, the cause of knowledge.

The Advaitic project is then taken to be as follows: it is an exploration of the subject-object relationship in the sense that it seeks (a) a conception of an order, extrinsic to the cognitive faculty, which is required for there to be an epistemic life of systematic knowledge claims, and (b) to determine the extent to which that conception can be established as explaining the metaphysical relationship between the cognitive order and the order of objects cognized. We have discussed the *pramāṇa* theory and settled on a fairly austere interpretation of what, minimally, it is taken to do: it lays down the condition that, through the various instruments of cognition like perception, inference, and testimony, there is a procedure for validating the knowledge claims that can be logically consequent upon a cognitive episode. This procedure consists in determining the existence or nonexistence of a justificatory chain from cognition to its object (or alleged object). The arrangement of the elements of the justificatory chain does not deviate from the arrangement of the elements of the causal chain that exists between cognition and the relevant object in the case of a correct cognition; it is merely claimed to exist when in fact there is no such causal chain (or no such object) in the case of an erroneous cognition. As such, the *pramāṇas* regulate the epistemic life of experience; their systematic nature is held to be, minimally, coexistent and contiguous with the systematic arrangement of the experienced order. The metaphysical issue, then, is what would be the appropriate construal of this coexistence.

2. Transcendental Arguments. One noticeable feature of the present essay will be its characterization of certain Indian arguments as 'transcendental' ones. A transcendental argument, since the time of Kant, has been taken as one which attempts to show that the world must be a certain way if the

experience of it is to be what in fact it is. To quote Kant on the connection such a proof attempts to make between the nature of experience and the nature of the experienced world:

> [I]n transcendental knowledge … our guide is the possibility of experience…. The proof proceeds by showing that experience itself, and therefore the object of experience, would be impossible without a connection….[11]

Conventionally, a transcendental argument is supposed to show, a priori, what must be the case for experience to possess the features it does. If that can be accomplished, the doubt whether experience is indeed of the ostensibly experienced world is refuted. The argument is therefore held to rely on demonstrating that certain things must be necessarily the case for there to be experience. Given the requirements of a priority and necessity, it does not seem obvious that the concept of transcendental arguments can be transposed to the Indian scene, due to the absence there of the notion of either of these requirements in a way easily recognizable to philosophers of the post-Kantian tradition.

But the situation is not so straightforward. There are considerable problems in assuming that successful transcendental arguments ought to be built on these requirements. Before actually going on to talk about that, let us examine a related idea: that of 'descriptive metaphysics'. This is basically the project of exploring the various connections between the features of experience such that an account of the world emerges which may be held to be coherently related to these features. This is a looser formulation of the metaphysical program than the initial version of the transcendental requirement. Obviously, both this sort of metaphysics and transcendental arguments work on the basis of the claim that we can form no coherent or intelligible conception of a type of experience which does not exhibit the features that actual experience does.[12] It seems clear enough that the Indian philosophers were indeed descriptive metaphysicians. They strove to explain the nature of cognition and knowledge on the basis of the objects of cognition and knowledge. By having a theory about the system of validation, they attempted to give an account of how the cognitive life (meaning experience, awareness, knowledge, and error) coheres with one or another view of the nature of the world. It seems only fair to take it for

granted that Indian metaphysics can, among other things, be called descriptive metaphysics.

Now, it might be thought that transcendental arguments are not the same as, or even part of, descriptive metaphysics. It may be reasoned that the two do not perform the same task. On the one hand, transcendental arguments could be required to prove that there cannot but be a world independent of our grasp of it but of which we have experience. On the other hand, descriptive metaphysics seems to be content with the task of showing that, depending on the nature of experience, the world's being a certain way would best explain that nature. Such a descriptive project does not seem to move from an awareness that experience possesses the features it does to the claim that those features are possessed only because what is taken as experienced actually is *as* it is experienced. If the latter has to be proved for a metaphysical project to be successful, descriptive metaphysics fails the task. Further, there is no conclusive proof that experience does not *actually* rest upon conditions of which we have no conception; consequently, the world may not be how it seems to be experienced.[13] There are, therefore, two claims involved in the contention that the sort of descriptive metaphysics described above is inadequate. For one thing, it would fail to show that there must be a world independent of the experience of it. For another, it would not disallow the possibility of a world which is not experienced but which yet determines the nature of our experience (as illusory).

This is by no means uncontroversial. There is also a further point to be made. It could well be the case that it is misguided to ask for a transcendental argument to prove that there cannot but be an independent world which is nonetheless experienced. If this requirement is rejected either for being logically impossible or for being an unargued premise, then a case could be made that the work of descriptive metaphysics is coeval with the development of transcendental arguments. Peter Strawson, the best-known contemporary proponent of transcendental arguments, and the coiner of the phrase 'descriptive metaphysics', has written that the metaphysical project of description, including as it does transcendental arguments, "remains valid even if our transcendental arguments are not strictly conclusive, i.e., do not successfully establish such tight and rigid connections as they promise."[14]

Now, there seems to be a *prima facie* case for not separating descriptive metaphysics from transcendental arguments. It may well be the case that if transcendental arguments *have* to deliver on their promise but fail to do so, and descriptive metaphysics does not acknowledge the legitimacy of that promise, then the two are different things. But initially, if both are involved in the attempt to explain why 'cognitive life' possesses the features it does, and it is only later shown that it is misguided to expect transcendental arguments to deliver on their so-called promise, it seems acceptable not to stipulate that there is a difference between the two. Therefore, I assume that when the Indian philosophers attempted to explain the components of cognitive life in terms of the cognized world, they were implicitly relying on transcendental arguments. The proviso is that transcendental arguments here are read as arguments attempting to show what account of the world would best explain the nature of that world, held as that world is to regulate the commonly admitted system of validation. They should not be construed as arguments attempting to show what are necessary conditions for there to be experience regulated by that system of validation. In saying this, I want to avoid the criticism that Stephan Körner makes of transcendental deductions of any particular categorical framework:[15] it is impossible to demonstrate the uniqueness of such a framework, but a transcendental argument will not establish metaphysical truths unless the universality and necessity of the framework it employs is demonstrated; and there are no good empirical or philosophical reasons for thinking that the unversality and necessity of any such framework has ever been demonstrated. My point here is that the descriptive approach I think most useful is one which is light on framework and rather heavier on empirical elements, and that, consequently, it makes a claim not about the necessity but merely about the plausibility of the account given.[16],[17]

3. Basic Distinctions. We now stipulate what could be termed the idealist-realist distinction. The *idealist* holds that the epistemic life is ensured only if causal and justificatory chains do not run between distinct orders but within a single one, such that epistemic activity can be directed at whatever occupies the content of cognition. As the causal chain is held to run from object to cognition and the justificatory chain from cognition to object, if the chains ran within the same order, the object of a cognition would not be distinct from the cognitive act which presents it. The 'co-occurrence' of

object and cognition is explained by the absence of any ontological distinction between them.

The *realist*, on the other hand, thinks that if epistemic activity is to be assured, the justificatory chain must agree with what is in fact the causal chain. But if there is to be such agreement, the components between which there is agreement must perforce exist. Such an agreement therefore requires the existence of an order of objects (for there to be a causal chain) and the existence of a cognitive order (for there to be a justificatory chain).

Into this situation comes the *nonrealist*. For this person, the essential distinction that the realist makes between the two orders is inescapable because that is given in the content of experience in a manner that cannot adequately be explained away, and epistemic activity is aimed at the ordering of the content of experience. On the other hand, however, he or she thinks that more must be said on how merely distinguishing between the two orders in this way constitutes proof of an ontological divide between them. The nonrealist notices that alleged proofs regarding the existence of a divide between the two orders seem to depend on the content of one order, namely, the cognitive one, and concludes from this that all that can be shown is that an account of experience requires a distinction to be made between the two orders. The nonrealist maintains, however, that if any proof is dependent on the content of the cognitive order alone, then such a proof will not establish, as the realist wants, the divide between the two orders via an argument that an independent extrinsic order is somehow necessary for experience. The proofs that are in evidence seem to depend on the content of the cognitive order, and therefore can only show that the features of that cognitive order can be explained by recourse to the notion of an extrinsic order alone. Nothing actually establishes the nature of the extrinsic order as distinct from, and totally independent of, the nature of the cognitive order.[18]

II

1. Conditions for the Occurrence of Experience. Śaṅkara starts by referring to the subject and objects that are distinct from one another. Thereafter the conditions required for experience (or 'empirical' experience as it is generally called in Vedantic terminology, to distinguish it from the putative

experience of an ultimate reality) are given: it is through a relation between cognitive subject and object that one has a conception of this, the natural experience of the world (*naisargiko 'yam lokavyava-hāraḥ*). The fundamental distinction required for cognitive activity (that is, which must be made if there is to be any account of cognitive activity) consists in this: a subjective order whose content is given by its being the recipient of an object's presentation (an 'objectee', it could be said) (*asmat-pratyaya gocare viṣayinī*); and an order of objects whose content forms the accusatives of presentation (*yuṣmad-pratyaya gocare viṣayaḥ*) (that is, consisting of nonsubjective elements). It is clear that it is appropriate to interpret 'yuṣmad' here not in the primary sense of 'you' but as 'other than the self', where 'asmat' stands for 'I' in the sense of the subject. Awareness is therefore structured by ascription of characteristics to cognized elements —including, fundamentally, that of being extrinsic to the subject. The extrinsic nature of objects is implied by the claim that the act of cognition and its accusative are as different "as light and darkness."[19] This last is important because Śaṅkara's claim is that there is no getting around the source of the notion of externality of objects (and in a generally non-Cartesian way, their being extrinsic to the cognitive faculty): it is derived from the content of experience itself. Then, indubitable awareness is partly constitutive of an order of awareness in which awareness is awareness of something (namely, objects are what the subject's experience is the experience of). It is because of this that there is an epistemic life. That is to say, there are claims to 'know' what it is that is presented in experience. It is with this claim with that he begins the introduction to the *Brahmasūtrabhāṣya*.[20] Literally, the arrangement and nature of these objects are a superimposition (*adhyāsa*) on cognition.

The general Advaitic point is that superimposition is the process by which there is ascription of an attribute or quality (*dharmāḥ*) of the accusatives of cognition to the content of cognition. As a result, there is an interaction between the subjective state of awareness, and the entities, extrinsic to that awareness, which form its objects. That interaction leads to such typical experiential states as taking that "I am this" (*ahaṃ idaṃ*) and "This is mine" (*mamedaṃ*), and so on. So primarily, the Advaitin thinks that there is a curious situation wherein though the intrinsic state of awareness is fundamentally different from entities extrinsic to it, experience is itself constituted by a relation between the intrinsic and the extrinsic,

whereby the intrinsic state of awareness is qualified by the extrinsic state. Given the related Advaitic theory of a unified self, I shall generalize from the single subjective state, and talk of the subjective or cognitive order; and given the commonsense empiricism that there are objects of awareness, I shall generalize from the single object of cognition and talk of the order of objects or the extrinsic order.[21],[22]

Experience results in claims to know of objects, and that implies a notion of what it is to have knowledge (?*vidyā*) and what it is to lack knowledge (?*avidyā*). That notion is in turn possible because of a conception of what it is to distinguish between claims where there are such objects as are presented in cognition and claims where there are no such objects. But the requirement for such a system of validation and invalidation is itself derived from what experience presents to the subject: an order of objects whose arrangement the cognitive order must correctly reflect, by explicating a justificatory procedure which does not deviate from the causal chain that must exist between the object and the cognition of it. In short, the *pramāṇas* are experientially based.

The systematicity of cognitive life itself provides a conception of the *pramāṇas*, but it is by the use of the *pramāṇas* that the existence of those conditions which constitute the systematicity of experience (that is, the existence of valid epistemic activity) can be postulated. That is the significance of the *pramāṇas*: if their instrumentality is implied in epistemic activity, that is, if they are used for justificatory procedures, then so, too, is their causal role implied, which is to say that the source of their validation (the order of objects) just is the locus on which epistemic activity functions. As noted in section I, this form of empiricism, that is, a thesis that the system of validation available to us is one whose provenance is experience, was consensually favored by *pramāṇa* theorists, Naiyāyikas, Mīmāmsakas, Vedāntins, and Vijñānavādins alike; those like Nāgārjuna and Jayarāsi who did not accept the *pramāṇa* theory were altogether skeptical of the possibility of knowledge and the giving of a theory of reality. This fact must be kept in mind, because it is the consensus on the experiential origin of the system of validation which impels the discussion in the direction it actually takes. Śaṅkara is able to emphasize the relation between the available system of validation and the ineliminable feature of experience in the way he does because his opponents do not themselves challenge the experiential derivation of the system of validation.

2. The Dual Aspect: Śaṅkara and Strawson's Kant. Śaṅkara says that the ineliminable feature of the constitution of experience is in the form of a 'dual-aspect':

> It is constitutive of the nature of things that there is a fundamental distinction between the subject of experience and what is experienced, the subject of experience being the conscious embodied person, while the experienced consists of objects such as sounds etc.[23]

—he has an opponent say, before agreeing with him. So, there is a subjective order of awareness, intrinsic to a particular person, of an order of entities of which there is awareness. I take the liberty of calling that which Śaṅkara calls 'objects', in the plural, 'the order of objects', and the sequence of cognitions of a conscious unitary individual 'the cognitive order'. It is from this experiential situation that the systematic nature of the *pramāṇas* is derived, which in turn implies the systematic arrangement of the order of objects. Objects have to be that way, or else experience would not be understood the way it is. It is from experience that we get an idea of how the world must be for experience to possess the nature it does. If one can hazard a slogan, Śaṅkara relies on empirical material for a transcendental argument.

It is with some trepidation that one brings up the similarity between such an idea of the dual aspect of experience and the one Strawson derives[24] from his reading of Kant. There Strawson says that experience must be conceived as the passage of a subject through an objective world; this objectivity consists of an order and arrangement which can yield the formation of order and arrangement in the epistemic grasp of different subjects, and which is independent of any particular subjective grasp of it. There is no denying that Śaṅkara sees some such distinction between an order of awareness and an order of objects as a requisite for the explanation of the conditions under which cognition occurs. He gives, too, as we shall see, some idea of what he thinks this grasp of objects should consist in and what that implies about the nature of these objects in a broadly 'empirical realist' way.

There are, however, significant differences. For Kant, an 'object' implies 'objectivity', which is a weightier notion than that of entities extrinsic to

cognition, and one which includes the concept of a general independence of entities from the cognition of them and their intersubjective (hence 'other minds'-involving) stability. He attempts to achieve this transition through the argument for the necessary unity of consciousness, namely, the thesis that experience of a unified objective order requires a unified consciousness. Strawson interprets this as requiring a self-ascriptive, or reflective, capacity for the awareness that that unified subject possesses.

In Śaṅkara, as in other Advaitins, there is an interesting thesis of 'self-illumination' (*svaprakāś;a*) held to be possessed by a unified self or witnessing awareness (*sākśi-caitanya*). But it is not entirely clear that the sort of relationship found in the Kantian picture is available. Here, it is related to the controversy of what it is to know that one knows, and about a nonregressive use of the *pramāṇas*. Primarily, it has a soteriological function, besides which there are also notions of immateriality and personhood. As such, I shall not be examining it.[25] Instead, what we have here is a less weighty notion of objects: it does not include the a priori concept of objectivity, but just deals with a conception of entities as distinct from the cognition of them and which possess a complex of properties accessible through the complex of cognitive instruments possessed by the subject. For the purpose of distinguishing this more austere interpretation of objects than the Kantian one, I shall talk of an 'order of objects' or an 'extrinsic order' rather than an 'objective order'. It will also emerge that Śaṅkara's construal of the dual aspect is one in keeping with the nonrealism of Advaita.

3. Śaṅkara: General Conditions for a Systematic Cognitive Order. Before we examine the way the dream analogy is used by Advaita, we must first establish the nature of the 'empirically realist' nature of the cognition-object relationship which the Advaitin is willing to countenance. It is the characterization of this nature that establishes the fundamentals of the Advaitic view of experience. Śaṅkara lists, in the course of his critique of Buddhist idealism, the general conditions of the cognition-object correlation. He evidently takes the existence of this range of correlative types to be indicative of the explanation of the complex character of experience. First, I present the terms of my interpretation.

A cognition has content by representing an object, and it is by virtue of this representation that the cognition is characterized as the cognition of that

particular object (and no other). The cognition is what it is because of the object qualifying it. Therefore the object is the qualificative of cognition, and the cognition is the qualificand. The object gives content to the cognition through the cognition being a representation of that object.[26] For there to be a cognitive order which constitutes a grasp of an extrinsic order, these general conditions must hold. I give here a substantially interpretative rendering of a passage in which Śaṅkara states the conditions in terms of actual examples.[27] What follows is a reformulation of this passage:

> [And again,] in 'cognition of a pot' or 'cognition of a cloth', the qualificative distinctions occur with regard to pot and cloth, but not with the substantive qualificand cognitions, as, for example, in the instances of a 'white cow' and 'a black cow'; whiteness and blackness are different qualities but not [the principle of] 'cowhood'. And the difference of the one [the principle] from the other two [whiteness and blackness] is obvious, as is the difference between the latter two and the former; similarly, there is a distinction between [cognized] object and cognition. So, too, should be our understanding of the perception of a pot and a memory of it, where the substantive qualificands, perception and memory, are distinguished, but the qualifying [or qualificative] pot is [a] common [factor]. Thus, too, there are instances of the cognitive states of smelling the milk and tasting the milk, where the substantive qualificands 'smell' and 'taste' differ but not so the qualificative milk.[28]

   (1) For objects *a, b, c,…* and for cognition *C*, it must be the case that there is *C(a), C(b), C(c),…*; and there should be individuation in cognition where there are different qualificatives (*viśeṣana*) of cognition, *a, b, c,…*, and a common substantive qualificand (*viśeṣya*), cognition (*jñāna*).
   (2) For any object a cognized at time t_1 in the form of perception *P*, and at time t_2 in the form of an episode of remembrance, that is, an act of memory *M*, there should be individuation by cognition of the difference between $CPt_1,(a)$ and $CMt_2(a)$, where t_1 is the time of the presentation of the object, requiring the presence (*bhāva*) of that object located as represented, and t_2 the time of the episode of remembering the object, independent of the presence (though Śaṅkara puts it as actually requiring the absence, *abhāva*) of the object, and the qualificative a of cognition is

common, though there are different substantive qualificands, cognition through perception and cognition through memory.

(3) For any object *a*, for any two or more modes of cognition, as in the perceptual types smell (S) and taste (T), there must be individuation through such cognition as $C_T(a)$ and $C_S\{a\}$, where again the qualificative a of cognition is common and there is difference between the qualificands, cognition through the perception of taste and cognition through the perception of smell.

The importance of these conditions is clear enough. Condition (1) refers to the capacity of the cognitive faculty to instantiate, over a variety of particular instances of cognition, subjective states of apprehension whose content is determined by the characteristic nature (*svabhāva*) of whichever object is represented (keeping in mind the episodic nature of cognition, *jñāna*, as a particular state of representation of an object). It is therefore the most general condition required to characterize a legitimate cognitive order of awareness. Condition (2) talks of the continuity of that order by way of the relationship between the episode of cognition through presentation, and the episode of remembrance, which confers dispositionality to the cognitive faculty.[29] It therefore gives the condition under which cognitive elements are arranged as members of the cognitive order.[30] Condition (3) adverts to the interconnectedness of the instruments of the cognitive faculty, and points to the complex matrix of presentation and apprehension within which the relationship between the two orders functions.

More detailed and perhaps more careful formulations may be given to substantiate the account of what the conditions are for the cognition-object relationship, but we have here a basic account of these conditions, simple as they may seem more than a millennium later.

To sum up: for there to be experience, there must be a distinction between cognition and its object. We must assume that cognitive life is a primitive fact because subjects are logically obliged to affirm it. But the content of cognition is constituted by the representation of objects. Such content itself represents objects as external. The representation of objects leads up to the issue of whether objects of cognition are correctly or incorrectly represented; and this issue is addressed through the requirement that conditions (1), (2), and (3) hold in the case of correct cognition, or fail to hold in the case of the purported object not being correctly represented. It is the nature of cognitive life—experience—that there is systematic

representation of extrinsic objects. To account for this nature, we need an explanation for systematic representation. This explanation is given by there being an order of extrinsic objects distinct from cognition, whose characteristics are represented by cognition in a systematic way (that is, allowing for discrimination between correct and incorrect cognitions, and for appropriate representation) by virtue of being regulated by the *pramāṇa* system.

4. Buddhist Idealism and the Dual Aspect. The Advaitic picture, therefore, has the *pramāṇas* working within the framework of the dual-aspect thesis. In the *Bhāṣya*, we find Śaṅkara proceeding on the basis of the contention that the epistemological deliverances of the *pramāṇa* system are assured if there is a distinction such as the one he postulates. His opponent here is the Vijñānavādin Buddhist, who is an idealist in that he does not wish to accept the extrinsic nature of objects.[31]

A philosopher may think it misguided to take the distinction between the two orders as a primitive feature of the cognitive life and, indeed, constitutive of that life, regardless of whether that distinction is held to be either ontologically established or transcendentally required to explain *pramāṇa*-bound epistemic activity. Such a philosopher would hold that there is no need to include the assumption of such a distinction in an account of the conditions required for the cognitive life, let alone some 'transcendent' proof (in the Kantian sense of depending on material not accounted for from cognitive grasp) that there is such a dual order. Such a position would involve the attempt to do away with the distinction, having in its place reference purely to the structure of the subjective order. This indeed is the view of the Vijñānavādin Buddhist. At the very outset, one philosophical point must be made. Buddhist idealists like Vasubandhu adopted the position that no order extrinsic to the cognitive exists. Sometime after Vasubandhu, Diṅnāga stated his own thesis that every cognition had its own dual aspect: an object aspect (*arthābhāsa*) and a cognizing aspect (*svābhāsa*). This was still an idealistic rendering, for all it said was that the description of a cognition must itself consist of the object that the subject understood herself to perceive and the subject's state of having that perception. Post-Diṅnāga writers called the objectivai aspect of cognition the object form (*arthākāra*), which was one of the elements constituting cognition. This interpretation of cognition, therefore, put

forward the idea that since the form of the object was intrinsic to a cognition, description of that object form exhausted the description of what was the object of cognition. "[I]nstead of saying with the old Yogācārins [that is, the Vijñānavādins] that the external objects do not exist, for nothing but consciousness exists, one can now say … [that] references to external objects are dispensable."[32] This is perhaps a more sophisticated way of arriving at the idealist conclusion. It does seem, however, as if the interpretation that we could give of the general critique of Vijñānavāda found in Śaṅkara can actually encompass both positions. The Vijñānavādin that Śaṅkara has in mind looks very much like Vasubandhu, or, at least, the arguments Śaṅkara has the Vijñānavādin give are the same as Vasubandhu's. For this heuristic reason, and without any particular historical justification, we will consider Vasubandhu's own words in tandem with Śaṅkara's. In the *Trisvabhāvanirdeśa*, Vasubandhu rejects the distinction between the two orders:

> What is the conception of that which is nonexistent? [The answer is] 'mind' [mental projection] / For by it, the nonexistents are imagined; and inasmuch as the mind imagines objects, they do not exist at all.[33]

> What is it that is presented in cognition? The nonexistent which is projected [or imagined]. How is that presented in cognition? In the form of a twofold appearance [of the apprehender and the apprehended] / What is it in cognition that does not exist? That by which the twofold appearance is affected.[34]

This position is defended in the Viṃśatikā section of his *Vijñaptimatrātasiddhi*. Here he argues that there is reason to reject the existence of the extrinsic order as independent of subjective construction (*vikalpa*), which rejection is the central tenet of idealism. However, his rejection is tied to an atomistic conception of such an extrinsic order, on which I shall briefly comment later.

5. Vasubandhu, Descartes, and Dreams. The way in which the argument from the dream analogy is used is interesting in its resemblance to and difference from the way in which Descartes used it. It is important to make the comparison because the dream analogy has a certain resonance in

Western philosophy, and the difference in usage has to be pointed out. We will, therefore, briefly deal with the rich and controversial Cartesian case in order to note the points of resemblance and those of contrast.

In the First Meditation, Descartes notes that he is often astonished to find that he had not actually been sitting in front of the fire but had merely dreamt that he had, and says, "my astonishment is so great that it is almost capable of persuading me that I now dream."[35] This is not to say that he thinks he cannot know that he is not dreaming, though much discussion has proceeded as though he did. But the importance of dreaming is that the senses can be deceived; a set of external objects is presented to the subject, but there is no such set as the 'experience' in the dream has it. This is the initial lesson to be learned from erroneous judgments, and that is what Descartes does. In the Third Meditation, however, the *malin génie* hypothesis is put forward. An evil demon may be consistently deceiving me into thinking I have experience of the world, so that cognitive life does not in any way match the way the world is. It has sometimes been argued that there is nothing new that the evil demon hypothesis adds to the dream scenario; it is all a question of lack of veridical contact with the world.[36] It seems, however, as if that can be argued only if the dream scenario is strengthened in a certain way: it must become the hypothesis that I may always be dreaming, in the sense of not being in cognitive contact with the world by being in a permanent dream state. That, however, hardly sounds like a dream. On the other hand, there may be something fundamentally different between dreaming and being deceived by the demon, where an instance of the former only points to the impossibility of ruling out the latter. It has been argued that dreaming itself can make sense only in the context of being awake. There must in general be veridical experience for there to be error;[37] there must be real coins for there to be counterfeits.[38] It might be legitimate to assume, within Descartes' realist theory, that it is right to correlate the presentation of external objects in the waking state with veridical contact, and the absence of such presentation in dreams with error. As we shall see, this is not acceptable to the idealist in any case, and in fact precisely the idea he would seek to displace eventually. But in any case, it will not do to make such an assumption. Descartes does not seek to put forward the skeptical scenario per se in the dream analogy, but the possibility of being in error about the objects of cognition. It is a further step from the admission of this possibility to the hypothesis that a subject

can be in error about the whole cognized order of objects. In this context, the reasoning that waking is required for there to be dreaming is not useful; it may even be circular. That is to say, to point out the essential *relational dissimilarity* between dreams and the waking state will be beside the point. It was indeed something that was clearly recognized by Descartes. The question for him really was what guaranteed this dissimilarity; that is, what guaranteed a veridical contact with external objects such that the difference between dreams and the waking state could be made out?

So the real issue here is not about the falsity of dreams (defined in terms of failure to be in contact with the external order) vis-à-vis the waking state, for that just opens up the problem of contact with an external order in general. As Ralph Walker says, "[w]hat is at issue is whether all my sense-based beliefs about the world, and indeed all my other beliefs as well, may not actually be false, because produced in me by a powerful and malevolent deceiver."[39]

The Cartesian argument starts with the acknowledged case of dreaming. While dreaming, one does not know that there is no such world as is apparently spatiotemporally presented. Dreams show that there can be cognitive instances where there is no such world as there seems to be. Since no one particular cognition can by itself show that it is itself not erroneous, no particular belief can be guaranteed to be true. An evil demon could well control all of one's cognitions and create a situation analogous to dreaming, with one having no grasp of the external world, and a consequent erroneous cognition and false beliefs. From the experience of dreaming comes the idea that there can be instances of cognition without objects, where the subject is unaware that there are no such objects as presented. In that case, consequent beliefs are held to be false. If the evil demon were at work, then all beliefs would be false.

The question that arises immediately is what could render those beliefs *false*? Only within a realist view is it possible to assume that there should be beliefs about an external world even though those beliefs could be false. This is the central assumption that Descartes makes. His view is that there is a world which is independent of all subjective constraints and that knowledge is possible only when there is (veridical) grasp of that world. Only if there is an independent and knowledge-giving external world can a failure to grasp that world exactly render beliefs false. From within the terms of his argument, nothing Descartes says actually justifies the belief

that there is an independent and external world which alone ensures the veridicality of cognition. Yet that assumption is crucial because the Cartesian inquiry delivers the skeptical conclusion only against the background of the thought that there is an external world which regulates cognition and consequently allows knowledge of it. To put it briefly, it is because Descartes starts with a realist assumption that he arrives at the skeptical conclusion.

It was the absence of any immediate guarantee that there can be any distinction between a cognitive life (as in a dream) where there is representation of an external world which is not there and a cognitive life where there is representation of an external world which is there that led Descartes to the conclusion that there had to be proof that there is such an external world. This world is one which can determine all cognition as false if cognition is not of it. So it must be proved that the world in cognition is that independent world. That proof for Descartes, of course, was that there is a God who could not be a deceiver, but we are not concerned here with that.

6. The Interpretation of the Dream Case in Vasubandhu's Text. With Vasubandhu, the argument proceeds in the opposite direction. It would not be proper to say that Vasubandhu advances a skeptical hypothesis, that is, a hypothesis about the breakdown in the regularity of epistemic activity, unless one were ready to assume a realist position about the requirements for epistemic activity. Vasubandhu uses the dream analogy, and indeed the hypothesis of systematic nonextrinsic cognitive life, for the purpose of securing an idealist epistemology. His argument is found in the *Vijñaptimatratāsiddhi* (Treatise on the State of Cognitive Construction).

Vasubandhu, too, sees that the experience of dreaming raises a doubt about the external world. But his approach to the issue is different from Descartes'. While dreaming, one has systematic experience (which is what leads the subject to believe that she is awake). Dreams show that no particular cognitive instance can guarantee that there is an external object as is represented in experience. There can therefore be experience without external objects as represented, without the subject being aware that there are no such external objects. If a particular instance of cognition lacks the guarantee that there is an external object, any other cognitive instances would be similarly infected. If any cognition at all lacks the guarantee, no

cognition possesses it. If so, all cognitions lack that guarantee. Vasubandhu concludes that it is perfectly possible for cognition to occur without external objects and without an awareness that there are no external objects.

It does not follow from the representation of external objects in general that there are such external objects in general. Dreams demonstrate the dispensability of external objects. There can be cognition without objects, and there is no need to correlate external objects with veridical contact.

But Vasubandhu does not stop there. He wishes to explain systematic cognition, and therefore the possibility of knowledge. According to him, the appeal of dreams lies in the fact that dreaming experience is systematic and apparently about external objects. So he takes into account the fact that experience is systematic and that it is constituted by the representation of objects. What dreams show is that both these feature of experience— systematicity and the representation of objects— can be present even when there are no external objects. From that he concludes that cognition requires no external objects. But since objects are undoubtedly represented in cognition and since a knowledge of them is to be secured, he concludes that systematic experience and the representation of objects can occur as they do only if objects are not external to cognition at all, but intrinsic to it.

To recap, for Descartes, if the content of cognition is not representative of an independent order, then there is a serious threat to epistemic activity. For Vasubandhu, unless the content of cognition is representative of a dependent and constructed order, the account of how veridical cognitions— and epistemic activity—occur is incoherent. One may put the contrast thus: the Cartesian concern is with how systematic perception of the independent world is achieved; the Vijñānavādin's concern is with the very coherence of the idea that perception is systematically of an independent world.

It is possible for Vasubandhu to conclude as he does because of two moves at the heart of his argument. One is the rejection of the idea that there has to be an external and independent world which alone can guarantee systematic cognition. In the *Vimśatika* (verses 11–15), Vasubandhu takes it that if there is any conception of an external world, it must be an atomistic one, under which each substance and each quality is constituted by its own inherent atoms. Cognition for the atomist is supposed to be accounted for by the causal power of these constitutive atoms acting on the cognizing subject/cognitive order, such that each cognition is caused by the relevant atoms. Vasubandhu says that if the extrinsic order is what is

experienced or cognized and such an order is atomistically constituted, then the very idea of systematic cognition becomes incoherent. He argues that if the cognized order is taken to be an atomistic extrinsic one, then cognition must be either (1) of single wholes for each substance/quality represented, or (2) of the totality of individual constitutive atoms of the represented object of cognition. (1) It is not the former because, even though, for example, the demonstrative cognition 'this is white' ought to occur (on the atomist's account) as a result of being caused strictly and solely by the whiteness atoms (quality atoms), the cognition in fact does not represent just the whiteness distinct from the substantial parts but an entire object which has, among other qualities, that of whiteness. Thus, even though the atomist analyzes the cognition as having been caused strictly by the 'whiteness atoms', leaving no explanatory space for the causal role of other atoms, like those which are supposed to constitute other qualities and substances, the cognition of whiteness is always accompanied by a representation of other features of the object—features, that is, which must be accounted for but cannot be on the atomist's causal account. (2) It is not the latter because, as a matter of fact, cognition does not represent a swarm of discrete atoms but complexly conceived objects. To sum up, if the world is an extrinsic and independent one, conceived atomistically, then the features of cognition are not accounted for. The most important feature of cognition—the representation of complexly propertied objects—cannot be explained by an atomistic account.

The second move Vasubandhu makes follows from this rejection of an extrinsic order: the assumption that there can be the apparent representation of an external world without such an external world, even when there is *veridical* cognition. The Buddhist is prepared to sacrifice the apparent externality of the world in order to assure himself that there is systematic cognition and knowledge. If we see the idealist move as an antiskeptical one, then it is possible to conclude that the realist assumption of an independent, albeit (for Vasubandhu) atomistic, world is replaced with an idealist assumption that veridical cognition can be intrinsic even if the representation of objects as external continuants is wrong. Vasubandhu moves from an antiskeptical assumption to an idealist conclusion. Indeed, he does so only because he cannot see how knowledge can be guaranteed unless objects are intrinsic to cognition.

It must be noted that Śaṅkara himself rejects atomism as incoherent.[40] As that is the case, even though Vasubandhu argues against an atomistic extrinsic world, the weight of his argument can be discounted in the context in which we are interested, for his Advaitic opponent in any case is not interested in defending that sort of realism. Thus, the attempt to demonstrate the failure of atomism to account for the features of cognition, while an important part of Vasubandhu's general strategy, presents no problem to the Advaitin; the latter's own conception of the extrinsic order is based, among other things, on a similar rejection of atomism. The apparently realist argument for an extrinsic order which Śaṅkara presents is entirely different from the atomistic one which Vasubandhu claims to have rebutted and which Śaṅkara likewise rejects. For this reason, I take the main argument between the Buddhist idealist and the Advaitin to lie elsewhere than in a discussion about the coherence of atomism.

The Advaitic strategy that we are concerned with here is to challenge, first of all, the idealist assumption that there can be any intelligible account of systematic experience and knowledge which rejects the external world. The criticism of the analogy of dreaming will center on the Buddhist attempt to deny the relational dissimilarity between dreaming and waking.

We will now examine the Vijñānavādin's criticism of the cognitive order and its (paradigmatically external, perceptual) objects, adhering to the contours of the argument that has been presented. Then, Śaṅkara's rebuttal will follow, including his analysis of the dream argument and the inadequacy of its support to the idealist thesis that there are no objects as are perceived to exist externally. Śaṅkara himself gives an outline of the Buddhist idealist's position in the *Bhāṣya*.[41] It is clear, however, that he must have had the *Viṃśatikā* or a similar text in mind, for his treatment is quite faithful to the Buddhist arguments. Where necessary, therefore, some of Vasubandhu's own words will be discussed in amplification of the points Śaṅkara makes.

7. The Vijñānavādin: Dreams Can Prove There Is No Extrinsic World. Śaṅkara gives a concise description of the Buddhist position. Quite simply, the system of validation, that is, the means of knowledge, the object of knowledge, and the result of epistemic activity, can all occur in systematic regularity only because they are constructively represented in cognition. In Śaṅkara's words,

For, even if it be the case that there is an external object, there can be no application of the system of validation [the *pramāṇas*] unless that object be located in cognitive content.[42]

The Buddhist is taken to hold that it is just not possible (*asaṃbhavāt*) for there to be external objects. The motivations for this view are many, some quite obscure: broadly, they have to do with the soteriological concern of interpreting the Buddha's teachings regarding the transience of the material world, and with the problems of building an ontology with the philosophical categories available to them. The latter lead to such issues as the atomicity of physical bodies, the whole-part relationship, and so on. They do not detain us here, and we will take these motivations for granted. Coming to the relevant argument, we find something like this: the common feature of representation is a cognitive state which is the enabling condition for the presentation of objects. This condition is the characteristic of experience (*anubhava-mātram*) whereby, for each cognitive instance, there is only that individual representation which exhausts the description of what it is for there to be an object of cognition. Obviously, the Buddhist view is taken to deal just with cognized objects, for there would be, for philosophers suspicious of entities actually accessible to sensory grasp, no question of entities beyond the ken of the senses. So it is understood that the Buddhist view is that an object is constituted by its being the sort of entity the cognitive faculty has a capacity for representing in an instance of awareness. Such identity-specific, that is, 'particularized', representation would not occur unless there was some unique feature to each cognitive instance itself; if that is so, it must be admitted that the form of the cognized entity (just) is representation in the content of the cognition; that is, cognition has the 'same-form' as the object in its content.[43] This argument is also attributed to Dharmakirti.[44] Identification of an object (that is, the knowledge of it) consists in cognition representing it appropriately. The presentation of objects can be explained just in terms of the contents of cognition; it is futile to posit an external order (*bāhyārthasadbhāva kalpanā*). In this way, there is an assurance that a cognition is a cognition of its object. The epistemic attainment (of knowledge) is assured because there is a correlation (or lack of difference) between the occurrence of objects and the cognition of objects (*sahopalambhaniyamādabhedo viṣaya-vijñānayor āpatati*).

Śaṅkara understands the Buddhist as arguing that this correlation is explicable only in terms of the object's being an element in the content of the appropriate cognitive episode; there is no ontic distinction between the state of objects and the state of the cognitive series. If there were to be some natural (or, more contentiously, 'real') distinction between the two, it is puzzling, according to the Buddhist, as to what would stop (cause a hindrance to, *pratibandhakāranatvāt*) the object and cognition from ceasing to be correlated in the way they evidently are in ordinary experience.

That presentation in cognition can actually include the feature of externality, and with it the possibility of independence from cognitive states even when the object is not extrinsic to the cognition of it, is unproblematic to the Vijñānavādin. Look at a dream. In a dream state, all sorts of entities are presented; and although it lacks an appropriate external object, there is a substantive distinction between apprehension and the apprehended.[45]

Likewise, it must be understood that the form of apprehension (of objects) in the cognition of pillars and so forth while awake is similar in presentation (to cognition).[46]

Śaṅkara's analysis is that the Vijñānavādin makes a claim to the effect that there is no epistemic distinction between the representation in cognition (*pratyayāviśeṣāt*) in the two cases. And, indeed, Vasu- bandhu does take such a line. In the course of doing so, he states some stock objections to his use of the dream analogy, and rejects their appeal. It is important to know how Vasubandhu himself phrases these objections and answers them, because a casual look at Śaṅkara's own critique may lead one to think that his arguments are sometimes the same as the ones Vasubandhu had dealt with and rebutted centuries earlier. But this is not so. Indeed, it is in the almost slippery formulations of Śaṅkara that one finds the fundamental theses of Advaitic nonrealism explicitly argued for by Vācaspati Miśra or Śrī Harṣa.

Let us, then, examine Vasubandhu's own formulation of the difficulties that he envisages as threatening his version of idealism. If the content of cognition does not represent (extrinsic) objects (*yadi vijñāptir anarthā*), an opponent of the Buddhist may say, there would be at least the following three problems.[47]

First, there would be no spatiotemporal regulation (*niyamo deśakālayoḥ*).[48] That is to say, experience is regular because it is determined by the stable objects of the world, which occupy a certain place

and are cognized at just that time when there is cognitive contact with them at that place. It is their occurrence, combined with the cognitive grasp of them, that causes experience at just the time and place to satisfy that condition of occurrence and no other. The Buddhist cannot ignore a causal theory of cognition which implies the existence of the extrinsic order.

Second, it would not be common to individual subjective orders (*santānasyāniyamaā ca*). Experience, if it were a cognitive sequence constructed by cognition itself, would not be, as it in fact is, of objects not limited to being presented to one subjective order alone, but accessible to other subjective orders.[49]

Third, there would be no causal function on action (*yuktā kṛtya-kriyā na ca*). Real food can be eaten and real weapons can hurt, but one is not satisfied by a dream apple.

It is clear that Vasubandhu advances these objections really in order to express the idealist ramifications of his argument. For, of course, it is the idealist's aim to give an account of experience that will mimic the conclusions of the realist. So Vasubandhu replies that as far as the first and third objections are concerned, nothing in his dream analogy will fail to cover these allegedly problematic cases.

In a dream, Vasubandhu argues, all sorts of things are 'seen' without those things being as they are seen.[50] They are not seen randomly, in all places, but in specific locations (within the dream scenario); and even these locations are not presented indiscriminately (that is, are not indifferent to systematic indexation). This spatiotemporal indexing (of dream images) is obtained without allegedly external objects.[51] Of course the occurrence of disconnected dreams does not vitiate the force of the point that there are regularities in dreams.

In much the same way,[52] action as a function of the objects of experience can be obtained as in a dream; for example, one could dream of running away from a charging elephant. It is important that the argument be that there is a parallel between apparently real actions while awake and the merely apparent actions in dreams. That is to say, in order to preserve the force of his claim, Vasubandhu must put the case that the waking life is as self-contained as is the dream one, and that consequently there is no relational dissimilarity between the two. His example here is, however, interestingly wrong. He argues that dreams can have all the causal powers of alleged waking life, for certain results can be brought about by dream

states. He illustrates his contention by pointing out that there can be ejaculation (that is, in the 'real' or waking world) when there is a dream of sexual union. But this just is an illustration of the interpenetration of dreams and the waking state, quite inapt for his purposes.

The simple solution he offers for worries about causal efficacy and effective production is this: so long as there can be apparent occurrences of such events as causal regularity and subjective reaction within dream scenarios themselves, the Buddhist can reinforce the analogy by encompassing these events within the ambit of dreams. The more there are similarities between dreams and the waking state, the more tactically advantageous it is for Vasubandhu. Since he is not arguing that one may be perpetually dreaming, the claim that dreams can be described only in contrast to being awake does not worry Vasubandhu, though, as we shall see, it should. He must simply find reasons for why an experiential order which lacks extrinsic objects is plausible. In his argumentative strategy, though not his motivation, Vasubandhu resembles Descartes.

The other objection is as to why it seems to a subject that experience consists of intersubjectively accessible objects. Rather like Berkeley, Vasubandhu is concerned about the external world, but not about other subjects. Of course, Berkeley does argue for the necessity of a mind other than one's own, but that is really God's Mind; and if he did write about other minds, whatever he wrote is lost. In Vasubandhu's case this absence of suspicion about other subjects is at one with the prevalent thought in the Indian tradition (apart from the Lokāyata materialists perhaps). Soteriological conviction probably lies behind this nonsolipsistic attitude.

In any case, Vasubandhu sets out to answer how intersubjectivity, or common presentation to different streams of cognition, is possible. He refers to the Buddhist myth of hell,[53] which is an experience of torment for the ghosts of evildoers. It is held by the Buddhists that it is morally unacceptable that the guards in that hell, who oversee the tortures carried out in unspeakable conditions, can themselves have done anything to have deserved hell; nor can they be born in hell, for creatures only enter the life cycle on earth. So, argues Vasubandhu, these 'guards' are not real creatures at all; and hell is not a place to *be* in. Rather, it is the cognitive condition under which evildoers have subjective states equivalent to experience. That condition includes all the alleged requirements of interaction with an extrinsic world. These are four: (1) the spatio-temporal indexation of each

particular experience, (2) the presentation of objects to cognition, (3) the intersubjective constancy of objects of experience, and (4) action as a function of causal efficacy.

That is to say, this hell is a hell for more than just a single subject; it is just the same sort of experience that souls which had committed similar evils have, even though the experience is the cognitive projection of each such soul. There are specific such experiences: swimming in a river of pus and filth is quite different from being pierced with spears or being flayed, and these torments are consequences of prior action, the pain that follows a consequence of that torment.

Later on, Vasubandhu adds that loss of memory (and dream visions) and other such states can be caused by the manipulative consciousness of demons and so forth.[54]

This hair-raising scenario can be seen as something like one where Berkeleyan subjects are manipulated by a Cartesian demon! The last suggestion of Vasubandhu's indeed comes quite close to the brains-in-vats scenario of Putnam[55] and others.[56] As is well known, Putnam envisaged a scenario where a mad scientist fixes up a brain in a vat and has its nerve endings wired up apparently to receive information of an extrinsic world. A possibility raised is that we are all brains in vats. The reading that one ought to give of the Vijñānavādin's tale is that there can be presentation to consciousness of the sort of entities as are familiarly interpreted as objects extrinsic to the cognitive faculty; this presentation can conform to the pattern of features that are associated with an extrinsic order, without there being such an order. There cannot be a substantive difference in the description one can give from *within* one's experiential material of what it is to have a genuinely extrinsic order, and what it is to experience systematically a projective one. If a substantive distinction cannot be made, from within one's experience, between having experience of a genuine extrinsic order and having a systematic representation of objects intrinsic to the subject, then there is nothing to stop the idealist from denying any distinctive role for the extrinsic order (postulated or real). The nonexistence of that order does not lead to epistemic breakdown. Instead, only if the presented order is intrinsically constructed could there be any meaningful epistemic activity.

8. Śaṅkara and the Extrinsic Order: The Buddhist Analogy of Dreams Fails. Śaṅkara's aim must therefore be to show that the extrinsic order is required to explain experience, contra Vasubandhu. He must also try and show what the dream analogy fails to achieve, and say to what extent it does work. This latter aim is in a sense continuous with his critique of Vijñānavāda, for while the former aim is directed at establishing the anti-idealist basis of Advaita, the latter amounts to a statement on its nonrealism.

Śaṅkara starts off with the simple assertion that external objects (paradigm-extrinsic entities, available to perception) are not nonexistent, because they are perceived (*upalabdheḥ*). The argument is directed at the Buddhist's contention that the simultaneous occurrence of cognition and its object, and the experience of the individuation of an 'objective' element being invariably correlated to cognition of it, prove the ontological identity of cognized and cognitive orders. It is usually thought that the opponent here is Dharamakīrti. There is a famous saying of his:

> Blue and the cognition of blue are not different entities, for the one is invariably apprehended with the other. One should recognize their difference as due to false cognition, as with the moon [the double moon seen by an astigmatic], which is single.[57]

This conclusion is based on the reasoning that there is no object which is unapprehended, even though all objects are commonly defined as cognizable entities; and there is no awareness of a cognition in which there is no (cognizable) object.[58] Śaṅkara questions the correctness of this analysis. The nature of perception of external objects consists in the correlative occurrence of the cognition and its object, yes. But that cognition includes a representation of the externality of that object correlated to cognition; each object is cognized with its cognitive act.[59] Śaṅkara's conclusion is that it cannot be said that the object perceived is absent.[60]

His reasoning is as follows. The Buddhist has said that the waking world can be cognitively self-contained as a dream is, for even without such things as food, one can have the experience of being satisfied for having eaten, within a dream. Śaṅkara plays on this example. What is the cognitive state of subjects vis-à-vis the objects in question? It is the *perception* that they are *extrinsic* to the cognitive faculty. So the Vijñā-navādin cannot

claim that there is no perception *that* there are objects (that is, entities extrinsic to the cognitive faculty). As for the dream where one eats and is satisfied, it is a dream of eating and being satisfied. That is to say, the self-contained nature of the dream may well be akin to the allegedly self-contained nature of the waking state, for, remember, Vasubandhu is not trying to say that we are perpetually dreaming. But it is the nature of this waking state that it is one partly constituted by a perception *that* one eats food and is satisfied. If the Buddhist is to persist in differentiating between the constitution of the perception that he in fact has (that there is an extrinsic order) and the claim that there is no object of perception, then he must assert something rather odd. As Śaṅkara asks,

> [H]ow can someone's words be acceptable if he says, "I do not perceive, and that object does not exist," even while himself perceiving an external object through sensory contact?[61]

This is rather like a man who, while eating and experiencing satisfaction says, "Neither do I eat nor do I get any satisfaction".[62] This is all just to extract from the Buddhist the admission that it is not as if there is no perception of an object (*na kaścidartham upalabhe*) but that there is no ontological disjunction between the perceived and perception of it (*upalabdhivyatiriktam nopalabdha*).

The immediate question Śaṅkara asks is what the disjunctive elements are. The fact is that experience does not consist of a series of subjective grasps of *perception*, but of objects *perceived*. The Buddhist cannot make the case that the idealist metaphysics adequately explains the structure of experience. That experience is just not explained in terms of a subject's ordering of various perceptual instances, but rather of the subject's ordering of what gives content and form to that perception. Two issues run together here: (1) there is a claim for the need to distinguish between perception and the object of perception; and (2) there is a claim that the perception of the externality of the object perceived is the basis on which the distinction is postulated. Śaṅkara is making a case that the latter claim is self-evident, thereby hoping to substantiate the former. What he seems to say is that it is a curious way of going about things to conceive that people take their cognitive life to consist of an apprehension of the sensory mode of the presentation of an object, rather than the apprehension of an object (usually)

with an awareness of what sensory mode it is by which that object is apprehended.[63] Saying that the perception of an object is correlated with its object, and that the 'grasp' of an object is nothing more than the subject's perception of it, is not the same as saying that that object is nothing else than that perception. If it were the same, there would not be any issue of the extrinsic nature of objects being partly constitutive of the perception of objects. One may put the Advaitic question this way: if the essence of objects is their perception, what is the essence of their perception as extrinsic to the cognitive faculty? Śaṅkara thinks that the perception of this extrinsic nature is an ineliminable feature of experience, and that therefore the conditions required for experience must be conceived in such a way as to include the possession of this feature.

> And that is why an ordinary person understands these others [the Vijñāna-vādins] as assuming the existence of an external entity even while they deny it by saying. "That which is only the content of an internal state appears as though external."[64]

Śaṅkara here is quoting Diṅnāga, who claims that the object-based causal support (*ālambana*) of perception is not given by external objects but is the form given to cognition by its own internal construction (*antarjñe-yarūpa*).[65] He latches onto the role of the concept 'as though external' in the Buddhist explication of the conditions under which experience occurs. This conception of externality is important, because that is what plays a determining role in regulating what are objects of cognition. It is Śaṅkara's contention that experience can be made sense of only if the conception of an order extrinsic to the cognitive faculty is entertained. Once it is admitted that the conception of externality (and of objects being extrinsic in general) is fundamental to the explication of the conditions required for experience, the force of the idealist's rejection of the dual aspect of experience and the purely projective nature of the epistemic life is lost.

> Accordingly, those who wish to accept truth as what is experienced should admit the external presentation of objects as they appear, and not hold the notion that it is 'as if' objects are presented externally.[66]

Śaṅkara accepts the premise that truth is put in terms of experience; he is not committed to any realist notion of a truth (or notion of the nature of the extrinsic world) independent of experiential constraints. But all the same, even with that nonrealist premise, he still concludes that the idea of external objects must be admitted, unlike the Buddhist. He wants both a conception of externality and an experiential constraint.

The role of the material of experience is therefore significant, as is evident in Śaṅkara's critique of the dream analogy.[67] But first, one thing must be noted concerning his analysis of dreams. It was suggested earlier that pointing out the essential relational dissimilarity between dreams and waking is not really very useful against the Cartesian hypothesis. That was so because the role of dreaming was only to bring attention to error and thereafter to sketch the scenario of pervasive error. In Vasubandhu's case, however, this criticism does have some force. For him, the role of dreams is to support the thesis that there could be cognitive life sans objects. The argument in Vasubandhu revolves around the absence of external objects in dreams, where that absence is defined in terms of its being the opposite of what objects are when one is awake—present. There is thus an ineliminable reference to the state of affairs when one is awake, and this reference is important. It has been suggested that Vasubandhu's example of real ejaculation as a result of a dream of coitus fails at just the point where it should not: it breaks down the self-contained nature, which he wishes to preserve, of each world, the waking one and the one in dreams. Śaṅkara remarks dryly at a later point in the *Bhāṣya*,[68] that if dream states were claimed to have effect in the 'real' world, a man dreaming of visiting the land of the Pañcālas would then have to wake up there. Śaṅkara puts the case in terms of the material of experience. There is a contrasting perception of the presence and absence of objects, which contrast enables Vasubandhu to draw his analogy. But what is this analogy based on? The answer: the material of waking experience itself. And Śaṅkara thinks it is quite wrong for the Buddhist, who distrusts the experience of the perception of externality, nevertheless to want to use the case of his cognition in a dream to cast doubt on the conditions under which there is experience in the waking state. How can he at one and the same time question the legitimacy of the structure of experience and yet construct an analogy whose logic is based on that experiential order itself?

That being so, it cannot be asserted by a man who comprehends the difference between the two [states] that the apprehension of the waking state is false, just because it is an apprehension resembling that in a dream. And it is not proper for knowledgeable people to deny their own experience.[69]

Moreover, because it will contradict one's experience, one who cannot establish the lack of objectual support possessed by cognition in the waking state should not wish to establish such a lack of objectual support on the basis of its similarity to cognition in the dream state [for that would itself contradict experience].[70]

The rule that Śaṅkara explicitly evokes here is one which states:

If a characteristic is not itself constitutive of the identity of an entity, it cannot be adduced as being possessed by that entity on account of that entity's similarity to another [entity which does possess that characteristic].[71]

If nonexternality is not constitutive of the identity of waking experience, it cannot be adduced as being possessed by waking experience on account solely of waking experience being similar to dreaming experience (whose identity is indeed constituted by the nonexternality of objects).

The argument here is tactically similar to the antiskeptical one that one must have waking experience to understand what is different about dreaming. But the issue is different in this regard: in the Cartesian case, the example is set up in such a way that to be awake is to be in contact with an extrinsic order, and therefore to have veridical cognition; to dream is to *fail* to have such contact, and therefore to have erroneous cognition. The Cartesian argument equates the absence of an external order with which to be in contact with a failure to *know*, this can be done only against the background of the assumption that to know is to be in contact with an independent extrinsic order. If so, it would be logical for a realist-minded skeptic to say that one must have veridical cognition (that is, be awake) to *know* what it is to have erroneous cognition (that is, to be dreaming). Then, the relevant question would be to ask how that veridicality, realistically defined as contact with an independent extrinsic order, is itself assured in

the first place (as it would fail to be so if the demon deceives one). In the case of Vasubandhu, veridicality is not defined as such contact. Here, to dream is to have cognition without an extrinsic order; therefore, if there can be cognition without an extrinsic order, to be awake may also be to have cognition without an extrinsic order. So, on Vasubandhu's view, veridicality is not defined in terms of what dreams fail to have vis-à-vis waking. That is to say, dreams are not defined as failing to be veridical by virtue of being out of contact with an independent order, because the idealist thinks that *all* cognitions occur without an independent and extrinsic order anyway. Dreams do not lead the idealist, unlike the realist (skeptic or antiskeptic), to think that apparent contact with the objects of cognition may be erroneous. The idealist thinks, instead, that the objects of cognition may not be external at all in any case. If so, it is not futile to criticize the idealist argument by saying that one must be able to *know* what it is to be awake to know what it is to dream.

The realist antiskeptic begs the question of how *veridicality* is defined as contact with an independent and external world, but he is not vulnerable to the doubt as to how dreams are defined vis-à-vis waking (for the realist defines dreams in terms of an absence of contact and waking as the presence of contact with a presumed external world). The idealist is *not* guilty of begging the question of veridicality (that is, he does not question-beggingly define it in terms of a presumed external world); but he does beg the question of *externality*, that is, of how he came to presume that he had access to this concept in the first place if the externality-presenting features of waking experience are to be rejected altogether. Vasubandhu, of course, does argue against the notion of external objects, which he takes to be conceived atomistically by his realist opponent. Since he finds the notion of atomistically constructed external objects paradoxical, he rejects altogether the possibility of explaining cognition in terms of (even nonatomistically construed) external objects. Vasubandhu then takes it that dreams disprove the need for any notion of externality to explain cognition, forgetting that the very notion of externality (albeit a nonatomistic one, which is to say, the notion with which the nonatomistic Advaitin is concerned) which he questions is one he himself gained only from waking experience. This criticism of Vasubandhu would not, of course, establish the externality of objects as the source of veridicality. If the Advaitin claims that it does, he would indeed beg the question himself. But the Advaitin argues only for the

requirement that there be a *conception* of externality so that the conditions under which experience occurs may be explicated.

9. The Extent and Limitations of Transcendental Arguments for an Extrinsic Order. Śaṅkara's criticism of the Vijñānavādin's denial of externality, then, is based not on any proof of that externality, but on the analysis of the conditions under which there is presentation of objects to cognition. Clearly, Śaṅkara takes his commitment to an extrinsic order to be established in some way because of the structure of representation in cognition. This may, I suggest, be equivalent to the claim that the order of objects is constrained by cognition for the Advaitin. The constraint is: the order of objects must possess the characteristics it does because that is what would explain why the cognitive order is constituted the way it is by representation of an arrangement of objects. Objects are part of the extrinsic order, in the way they are conceived to be, to the extent that the experience of them can be accounted for in this way.

Śaṅkara now has the Vijñānavādin claim a nonempirical reason for his rejection of externality (and by extension, the extrinsic nature of objects). The Vijñānavādin says that he came to the conclusion that there is nothing extrinsic to the cognitive faculty because it is just not possible for objects to exist, that is, to be external entities. Presumably, this is based on the consideration that if there is both a correlative occurrence of perception and its object, and a real distinction between them, then nothing could adequately explain how these distinct entities—a concept-loaded perception and a complexly propertied object—are correlated invariably and systematically as they are in veridical cognition (for, remember, Vasubandhu thinks that if that object were an atomistically constituted one, then the nature of the perception of it would not be explicable).

Śaṅkara's reply is not about the legitimacy of the claim that no object could possibly exist externally. His answer is best seen as an implicit criticism of arguments based on 'transcendent' reasoning: reasoning not legitimized by the possibility of confirmation through cognitive grasp. The criticism is that the Buddhist does not pay attention to what experience presents, concerning himself instead with an explanation based on what he thinks experience *must* present (namely, a false sense of extrinsic existence). Now it is doubtful if the Buddhist always argues this way; the problem with Vasubandhu only seems to be his interpretation of the

conditions of experience. However, it must be admitted that the polemical writings do show this tendency; for example, Vasubandhu says, in the *Madhyānta-vibhāga-kārikā*: "The nonexistent is imagined,"[72] where there is no particular argument to back up the claim. But then again the Advaitins themselves are hardly miserly with polemical statements. Be that as it may, this criticism should more properly be interpreted as a pretext for Śaṅkara to state his own view on the relation between the material of experience and systematic epistemic activity.

> The possibility or impossibility of the occurrence of entities is determined in accordance with the applicability or nonapplicability of the system of validation [the *pramāṇas*], but the applicability or nonapplicability of the system of validation is not ascertained in accordance with the [postulated] possibility or impossibility [of the occurrence of entities].[73]

> It is possible that that occurs which is accessible through any one of the instruments of valid cognition, such as perception; and that which is not accessible through any of those instruments of validation, it is impossible that it exists.[74]

It is cunning of Śaṅkara to accuse the idealist of ignoring the constraint from cognition, when it is the idealist who most wishes to deny any entities —like atoms—which do not form the content of the representations of the cognitive faculty; and yet, it does seem justified. The Buddhist may wish to deny that anything more than the content of cognition is available to the subject, and that therefore there is nothing more to the conception of the objects of experience than that content. But the content of cognition also provides the subject with the conception of the externality of these objects. To subordinate the presence of that latter conception to the desired conclusion derived from the former conception seems dishonest to the Advaitin. The application of the system of validation leads to the availability and requisite acceptance of a proper (presumably nonatomistic) conception of externality. To deny that (just because one particular conception, the atomistic one, seems problematic) is to transgress the rule that one should not tailor the system of validation to the ideological postulation of what is possible and what is not. This is more than just a criticism of the Buddhist; it is one arm of Advaitic metaphysics. The order

of objects is the one upon which the system of validation is operative. Member elements form the objects of epistemic claims which can be validated or invalidated by the use of the *pramāṇas*. If claims were made that there are certain objects or, in general, an order of objects, and these claims cannot be validated by use of the *pramāṇas*, then it cannot be claimed that there are such objects. From the available textual material, it seems safe to say that this should mean that there cannot be any epistemic activity if claims are about entities taken as inaccessible to cognitive grasp. It is wise not to read into this the claim that Śaṅkara says that only what is cognized is in some sense 'real'. This latter interpretation would be at odds with his hostility to the perception-bound doctrine of the Buddhists.

We then come to what is effectively the other arm of Advaita metaphysics (in the area which concerns us here).

External objects are made accessible to all the appropriate instruments of validation.[75]

This is crucial to Śaṅkara's thesis. The analysis of dreams is meant to establish the point that that analogy does not work well enough to explain experience without recourse to at least some conception of externality. The critique of the dream analogy has led to the expression of the role of the *pramāṇas*: (a) they work as a system of validation, and (b) that system implies a constraint on the cognized order. Now he claims that the very elements of the cognitive order are characterized by the fulfillment of two conditions:

(i) There is no representation in (cognitive) content of an object if there is no such requisite object.[76]

(ii) The externality of objects is simply (what is) perceived.[77]

The second condition is important, for Śaṅkara argues that the conception of externality itself cannot be argued away; there must be an explanation for this ineliminable datum of experience. He does not seem to think (it is sometimes unclear how much of a realist he took himself to be) that he has derived a proof that there must be an independent extrinsic order in the realist manner. But it does seem as if he is certain that experience cannot be anything at all as systematic as is required for the application of the system of validation, without accounting for this sense of externality. And given this feeling, it is clear that condition (i) must be interpreted causally. That is

to say, though there is a correlation of cognition and object, they are not ontologically identical. From the fact that when there is cognition that there is an object, and cognition includes a representation of that object as external to it, it can be concluded that it is by virtue of there being such an object that there is the cognition of it. It should be noted that Śaṅkara once more adheres to the nonrealist line on the conception of the extrinsic order. Such a conception is not the same as the one Vasubandhu rejects in the *Vimśatika*, where he argues that causal regularity is a feature of dreams as well. Śaṅkara's answer, in effect, is yes—but from that it does not follow that causal regularity is not a feature of (waking) experience; and the illusion of regularity in dreams has itself to be explained, especially when it has been shown that the conception of the nature of experience is a prerequisite for the understanding of the illusion of experience in dreams.

The claim that is defended is that there needs to be a distinction as described by the Advaitin. Śaṅkara says,

> [So] it has to be admitted that the regularity of the correlative appearance of cognition and its object is due to a relation of means and the goal, and not due to identity.[78]

Objects are just those entities toward which cognition is directed; consequently, cognition and objects are correlated because it is for the purpose of grasping objects that there is cognition. With this we conclude our discussion of Śaṅkara's critique of Buddhist idealism. He has attempted to show that an account of experience and cognition cannot dispense with the conception of an extrinsic order: he is a 'realist' to the Buddhist idealist. But this is only half the picture. In the next section, we will consider what it is that makes the Advaitin a nonrealist just as much as he is an anti-idealist. The issue is best brought out in the way the Advaitin accepts the analogy of dreams in a certain way, even if it is not the way the Buddhist does.

III

For the sake of historical accuracy, it should be noted that Śaṅkara was intent on establishing, through scriptural interpretation and argument about the legitimacy of scriptural testimony, the existence of an 'ultimate reality'

(*pāramārthika sattā*), the attainment of which is liberation (*mokśaḥ*). My interpretation of the dream analogy should not be taken as a denial of the importance of his soteriological concerns. The attitude here is that it is possible to examine the epistemological and certain metaphysical concerns of Śaṅkara which place the philosophical emphases elsewhere, without doing a disservice to the understanding of Advaita. As such, the specific issue of the use of the dream analogy leads up to the Upaniṣadic doctrine of liberation, but I shall be reading the text for that part of the argument which does not lose its legitimacy even if the scriptural underpinning is not considered, and the purely metaphysical issue alone is attended to. Perhaps, for one familiar with the attitudes of the Indian philosophers, this is one example of the coexistence of soteriological and analytic concerns which characterizes so many Indian texts.

1. The Legitimacy of the Analogy of Dreams. It has been pointed out by Ingalls that despite accusations that Śaṅkara's views were not profoundly different from those of the Buddhists he criticized, the fact is that there are substantial differences between the two.[79] Ingalls notes the fact that "Śaṅkara did not *begin* by denying the reality of the workaday world …" (emphasis Ingalls'). He thought, instead, as we have seen, that "the Buddhists completely reversed this process." In this regard, Ingalls comments[80] that Bhāskara is misguided in thinking[81] that Śaṅkara implicitly adopts the Buddhist position that dreams prove the nonexternal nature of the world. Ingalls points out that while his followers did slip into such arguments, Śaṅkara himself did not. He admits that even though Śaṅkara argues as a realist against the Vijñānavādin, he also uses the argument from dreams himself. Ingalls does not think that that makes him inconsistent or hypocritical. He points out that Śaṅkara does not explicitly reject the 'realist' argument against the dream analogy, as he would have to if he were an idealist. This does, of course, still leave open the question of why he *did* use the argument from dreams himself. We will attempt to answer this question now. Nevertheless, there is a valuable insight to be gained from Ingalls' comments, even if it is not immediately obvious. Śaṅkara argues both against the idealist use of the dream analogy, and for its legitimacy, which is to say he does not himself argue against the realist argument against the dream analogy. This indicates that the points he wanted to make in his rejection of the idealist use of the analogy, and his

acceptance of the use of that analogy, are different but complementary. It is their combination which makes his views 'nonrealist'. Ingalls' suggestion was that for historical and psychological reasons to do with the long history of Buddhist-Vedāntin rivalry, Śaṇkara would not knowingly have adopted a Buddhist position. This will be a more purely philosophical argument.

The Advaitin's view of what is legitimate about the dream analogy is that it raises the possibility of not being able to apply a general epistemic rule. That rule, call it [RC], is as follows.

[RC] to have veridical cognition is to be able to know that the extrinsic order is one which is accessible to the subject, such that the object of *this* cognition can be construed to be a member of that order, and therefore an object of knowledge.

The application of [RC] is not supposed to show that objects "really" exist, if '"really" exists' means 'proved, without appeal to the nature of experience, to exist as an object'. Yet the whole issue is held to be about what '"really" exists' means. For the Advaitin, if an object '"really" exists', that means something like that it is 'proved that the object would have to exist if the experience of it is to possess the features that it (the experience of that object) does'. Notice that as far as the metaphysical question is concerned, the Advaitin would only be prepared to give a transcendental argument about the conditions required for experience, rather than a transcendent description of the putative objects of the universe. Given this disagreement about the nature of physical reality, the question takes the form, not of whether objects "really" exist, but of what can be the correct explanation of the notion '"really" exists'.

What do dreams show, and what is the relevance of what is shown? In waking life, one is defined as *knowing* that there are no objects located and individuated as presented in dreams. But it is not known at the instance of dreaming that there are no objects individuated as presented. The fact that experiences in a dream are mere misperceptions is not grasped by one in a dream.[82] It is therefore not known while dreaming that one does not have access to the extrinsic order. Of course one is held to *know* that there is no access to an extrinsic order in dreams because one *knows* that there is access to such an order while awake. Given this sense of 'know', it is clear that one has to be awake to grasp what it is to dream and not have access to

an extrinsic order. But one does *not* know while dreaming that there is no access; one *knows* when awake that one does not know in a dream that there is no extrinsic order. But the point has already been proved. Knowledge of failure to cognize the extrinsic order is available only in cognition (when awake) relative to another cognition (while dreaming). Relative to what is it that it is *known* that there is an extrinsic order cognized while awake? After all,

> cognition with the stamp of conviction, supposed to be attained through veridical perception, does occur before waking to an ordinary man when he is asleep and sees things high and low.[83]

What it comes down to is that there can be neither a presumption that there is no independent extrinsic order nor proof that there must be such an independent order. So the logical possibility of an uncognized order cannot be ruled out, and that is what dreams eventually lead us to think. But does this mean that the cognitive life may be an illusory one, just because it cannot be ruled out that there can be a currently uncognized order, just because there are limits to empirical inquiry?

Śaṅkara had argued in the critique of Vijñānavāda that any conception of what it is to fail to be presented with objects (as in dreams) is parasitic on the conception of what it is to be presented with objects (when awake). Also, the conception of a presentation of extrinsic objects is an ineliminable constituent of the content of experience. The system of validation, which the *pramāṇas* comprise, is derived from the structure of the cognized order itself. Validity consists in the justified possession of the representation of the causal object (which is an element of the cognized order), and the system of validation makes available to cognition that justification by which a cognition is determined to be valid. For example, it is the tree being green and tall that causes me to see it as green and tall; but I can claim truly to have seen—and thus know something about—that tree only by being able to say of it that the tree I saw was green and tall. So, being able to perceive the tree (where perception is an instrument of *pramā*) is both the cause of my representation of it, and the justification I give for claiming to represent it veridically. Therein lies the regularity of cognition, based as it is on the nature of its objects.

Although the regularity of the cognitive order is dependent upon the regularity of the cognized order, the notion of the regularity of the cognized order is derived from the regularity of the cognitive order itself. This is a virtuous circle that the Advaitin does not wish to break, and cannot see how it can be broken. Returning to dreams: they are held to be cases of erroneous cognition. That is to say, we are able to apply the standards of validity to dreams and find them invalid. Underlying this judgment is the asymmetry between the dream and the waking states, which I have called a relational dissimilarity. Herein lies the explanation for our understanding of the notion of invalidity, and of the invalidity of dreams in particular.

> For someone having cognitive activity while dreaming, being bitten by a snake and bathing in water are events perceived to occur. Should it be argued that it is not true that such events [as the perception of these occurrences] occur, this is the reply: though it is not true that the actual events such as being bitten by a snake or bathing occur, there is comprehension that such occurrences as illusory perception did take place, for such awareness is not superseded even when one is awake. For even when one knows after waking up that the perception of events like being bitten by a snake and bathing in water were false, surely, one does not consider it false that one had knowledge of illusory perception.[84]

This is the essential point about dreams and the invalidation of cognitions. Dreams are not self-contained. Invalidation, as of dream cognition, is possible only because there is a system of validation, and the system of validation is available only because of the content of waking experience.

2. Two Conclusions from the Advaitic Use of the Dream Analogy and Their Consequences. This leaves us with two conclusions. (1) There can be cognitive states purporting to represent an extrinsic order even without any *knowledge* that there is an extrinsic order. That is because there can be no *knowledge* that there is an extrinsic order in dreams, for *no* extrinsic order is presented in dreams for any knowledge of that order to be possible then; but there can be dream states. If that is so, there is no general proof that there cannot be a cognitive order which fails [RC] in the realist sense. It cannot be ruled out that there cannot be some other order of reality which is not

normally (currently) cognized. (2) The conception of veridicality is dependent on the content of experience itself.

Conclusion (2) is the backbone of the argument that though we can discount dreams because we are able to judge that no extrinsic world is involved in it, we can so judge only because we have standards for that judgment (the system of validation) derived from experience—experience, that is, whose content is explicable only in terms of a presented extrinsic world. So if we use 'know' at all, we do so by virtue of our experience of an extrinsic world.

Conclusion (1) is more complex. The realist, who thinks that the extrinsic world is the sole and determinate real order, must stand by the requirement that cognition obey [RC] in a 'realist' way; that is, the order of objects of which experience is claimed is an order established to exist independently of the nature of experience. The Advaitic argument is that one cannot discount the possibility of cognition failing to meet [RC] in the realist sense. If there is an absence of proof that there must be *nothing other than* the extrinsic world (for that is what is meant by 'sole and determinate real order'), then the possibility that there may be a reality other than this extrinsic world cannot be discounted.

In dreaming, we have no proof that the 'experience' we have cannot 'give way' to some other sort of experience. When awake, we do see, by the argument from (2), that that inability to present proof of a sole and determinate dream world was founded on the fact that there *is* an order or reality to which we had no access while dreaming, and that there is an experience (that of the extrinsic world) to which dreaming 'gives way'. Now confronted with our inability to prove that our experience of the extrinsic world is the experience of a sole and determinate reality, we must consider the possibility of whether this inability is in turn founded on there being an order of reality to which we have no current access while awake, an order the experience of which our current experience could 'give way' to.

Can experience in the waking state be invalidated for this reason? The Advaitin thinks not. For the fact is that validity is a conception which is available only insofar as there is experience under conditions requiring the existence of that extrinsic order which explains the current structure of experience. There is no proof that there is an extrinsic order other than that it is required to explain experience. But just for that reason, there is no

proof that there is a system of validation other than that it explains the regularities of what is currently experienced. The notion of validity is available only because experience is in fact this way, and is just of this extrinsic world. If there were a state asymmetrically related to the waking state, then its existence could not render cognitive life invalid in any sense in which we use the term. The precondition for the application of the system of validity is the availability to experience of that extrinsic order which is required if the content of experience is to be what it is. If there is an order of reality which is possibly inaccessible to current experience, it would not be the order which validates or invalidates that experience. What would be the case if, say, there were indeed to be another hitherto unexperienced order and it is then 'experienced' (or there is some analogous contact)? The answer is that it would entail some 'system of validation' (or some analogous regularity-extracting system) which cannot be said to possess the same sense of validation that is currently available. After all, it is not as if there is regular interanimation between this state and the empirical one such as the one available between dreams and the empirical state. Of course, because of their belief in the authority of the scriptures, the Advaitins do claim that there is an 'ultimate' experience of realization (*brahmānubhava*) which would not be recognizable, or even describable, from current empirical states (that is, experience). But simply for the reason given, they also insist that the legitimacy of experience as it is known in this world cannot be denied, in the sense that there is no meaningful construal of invalidation that can be given in that case.

> Empirical practice, conforming to all the instruments of validation, cannot be discounted unless some other 'order of reality' is realized; for unless there is such an exception, the general rules obtain.[85]

This is by no means a clear position. The greatest uncertainty perhaps attaches to the issue of what should be made of the cognitive constraint on the system of validation. The reason for the problem, apart from the purely exegetical one of not having sufficient information in the text, is based on this consideration: as part of its steadfast opposition to the Buddhist theory that we somehow construct the objects of cognition, Advaita seems to reject the notion that physical reality is, in however sophisticated a manner, precisely our construction. Instead it seems to say that we cannot in fact

think other than as we do because how we think is derived from how we have experience, and how we have experience cannot be explained unless there is an extrinsic order from which how we think is derived. Yet what that extrinsic order is, we cannot say, other than through whatever experience we have, and therefore on the basis of how we think. This leads the Advaitin to combine two theses. One is that there could be an order of reality which is not the one explained as constituting a condition for the occurrence of current experience. The other is that we cannot be wrong about what we experience because what can be wrong is something we can say only about what is experienced, for wrongness is derived from what is cognitively or experientially available.[86]

3. Securing the Extrinsic Order through Transcendental Argument: Śaṇkara and Kant. The hypothesis that we may lack all veridical contact with an extrinsic order of reality may be advanced on the basis of the admission that although we possess a system of validation and a notion of invalidity, there may be no experience of that order which alone can render cognition valid. In rebuttal, however, we may say that it is not clear how the conception of invalidity, which is parasitic on the content of experience, can be applied to the regulative basis of this supposed order which is *ex hypothesi* not experienced. If we understand the hypothesis because we understand the notions of validity and invalidity, we do so precisely because we have the sort of experience we have. It would be unintelligible to suppose that there can be any such order, failure to cognize which renders cognitive life invalid.

   Alternatively, the hypothesis can be advanced that there may be an unexperienced order of reality and that that possibility cannot be dismissed. In that case, the answer could be that that order cannot be what constitutes the grounds for validity or invalidity, because what is available as the conception of validity is coextensive with what is experienced. Therefore, there may be an unexperienced order, but it would not affect the validation or invalidation of cognition.

   Albeit with much caution, some resemblance between Śaṇkara's strategy of tying the nature of ordinary experience to the objects of experience and Kant's must be mentioned. In the "Transcendental Deduction,"[87] Kant asks what the objects of representation are. On the one hand, they are 'nothing but sensible representations' and therefore cannot be capable of existing

outside the 'power of representation'. But on the other hand, we speak of objects as distinct from, yet answering to, our concepts of them. The concept of what these objects are comes from the experience of a systematic order of perceptions, that is, the representation of these objects. That is to say, the nature of experience is such that that nature (of systematic interconnected perceptions) gives us the ground for holding that experience is of an order extrinsic to cognition of them. Something has been said about what Śaṇkara requires of the cognition of objects, and the systematic complex that he requires surely looks like the sort of interconnectedness Kant talks about. There is, of course, more to this in Kant. Having shown in the "Aesthetic" that time and space are the forms of 'inner' and 'outer' sensibility, he thinks that the representation of an object in sense is nothing other than of what appears to us. Objects as perceived, therefore, are mere representations, not what they are without the imposition of space and time on the representation of them, though this space, in itself "a mere form of representation, has objective reality." There must, however, be an object which corresponds to our sensible knowledge of it, which is necessary to prevent knowledge through the interconnected nature of our experience "from being haphazard or arbitrary": the thing-in-itself, the object x, distinct from the representation of it and "nothing to us." As emerges in the "Paralogism of Ideality" (in the first edition), and in the section on dialectical inferences, this combination of sensible representation and things in themselves is crucial to the critique of idealism. Now, Śaṇkara's claim that there is no doubt that the content of experience includes the representation of external objects parallels that of Kant. Kant talks of represented objects as those things "the immediate perception [consciousness] of which is at the same time sufficient proof of their reality."[88] Further, in the intention that the role of objects in the regulation of the cognitive order and the inherent externality of objects of experience must be used against their opponents, the two are like-minded. But everything else looks different.

   Obviously, there is nothing in Śaṇkara like the categories, nothing like inner and outer sense. His strategy is different as well. Kant's contention that there is an immediate experience of external objects is directed at the sort of representationalist he calls the "transcendental realist who … plays the part of empirical idealist." The point that the representation of objects in experience is of objects that are indeed experienced is made in order to

dismiss the view that objects are merely inferred from the subject's access to the core of perception alone. Kant's aim is to counter the conclusion that it is uncertain whether experience is directly of external objects. Śaṇkara's point, on the other hand, is aimed primarily at what Kant would call a dogmatic idealist who claims that external objects do not exist. This aim of Kant's has to do with a more serious point of divergence. Kant, after all, wants to give an assurance that what is experienced must be what is real, in that it is a requirement of his metaphysical project that the order of objects must be the one which causes experience. Which is why, of course, things-in-themselves are central to his position. Strawson has noted[89] that, in the "Deduction" as elsewhere, Kant's thesis depends on a perception which results in sensible representations, but representations whose regularity must be determined by the things which have to be the way they are, even if how they are in themselves cannot be known. Strawson contends that there is no need to rely on a notion of a 'real' order of independent objects, for which sensible objects are a surrogate. It is quite enough to accept that "this conception would be empty unless experience contained such a ground for it as it does in that connectedness which makes possible the employment of ordinary empirical concepts of objects."[90] This is the well-known deflationary reinterpretation of Kant, which has been both defended and attacked, and I shall not go into its plausibility. However, it should be noted that, in a very important way, if Kant is to be interpreted rather than reinterpreted, then certainly the thing-in-itself is central to his position. As he himself sets up the issue, dispensing with them would push his position toward the sort of idealism which depends on the world being somehow constructed by spontaneous, subjective concepts or out of phenomenalistic entities. Both are offered as views he actually held but, as with Śaṇkara, only by ignoring his hostility to that sort of idealism. Things-in-themselves seem to have explanatory value as regulators of perception in that judgments on appearance must be in agreement with them; the matter of the unverifiability of their nature cannot discount their conceptual importance without an extremely strong empiricist interpretation of verifiability.[91] That is entirely in keeping with Kant's own view that the problem with empiricism is its refusal to go beyond the merely presented, and involves the Kantian strategy of postulating just what must be the case if the empirically available is to be explained. It is controversial, then, whether

Kant, in postulating an order of things-in-themselves, transgresses the limits he himself sets.

Be that as it may, both the Kantian and the Strawsonian strategies are concerned with stopping skepticism about knowledge of an external order. But the antiskeptical strategy is seen in both instances as consisting of an argument which allows an external order to determine, in one way or another, the regularities of experience (this depends on giving Kant the benefit of the doubt about his views on the nonsubjective source of the concepts of objects); that experienced order is the real (that is, the veridically experienceable) order apart from which there can be none other, and therefore experience cannot be other than what it is.

Now, Śaṇkara has nothing like a theory of things-in-themselves. His view of presented objects is altogether more austere than Kant's. He simply believes that experience can only be explained in terms of the apprehension of extrinsic objects, and that, beyond the availability of a theory dependent on that apprehension, there is no independent proof that there must be such objects. He is in agreement with the Kantian view that everything depends on the nature of experience in the explication of the nature of an extrinsic order of objects. He is nearer Strawson in not seeking a hidden order of objects, instead being content with there being such an order as is experienced. But transcendental arguments of the Kant-Strawson sort play a much more modest role in Śaṇkara's scheme of things. Experience as it currently is cannot consist of anything other than an extrinsic order if it is to exhibit the regularities it does and the systematic epistemic activity it affords. But that cannot show that there must be just that extrinsic order and that there must be just this experience alone. These cannot be guaranteed.

Either transcendental arguments do only what a nonrealist takes them to do, and show that experience can be accounted for the way it is only if an extrinsic order consistent with the systematic nature of that experience is postulated, or they can go beyond experience in some manner by yielding conclusions about how things are. But if transcendental arguments actually involve the nature of experience as the fundamental ground for explication, any such argument will be tainted by the nature of that experience and will not say anything more than that experience allows that that is how things are. It cannot, of course, merely be presumed that there is no proof of an extrinsic order or a world which accounts for how things are independently of experience; but no such proof is at hand. There may be proof that there

can be an independent order, but would this show that it is just that which is currently *experienced*? So long as the material of experience is central to an argument, the nonrealist will feel unsure about the likelihood of anything more than what he has shown. Perhaps there can be proof without experience, one that would involve Cod, for example. But that is another question altogether. And this is where Śaṅkara is so different from either Kant or Strawson. He will not guarantee that the currently experienced order is the independent extrinsic one, only that such an order would explain why experience reveals the system it naturally does. If any system is available at all, it is one which is available through the nature of experience as it is.

4. The Advaitin's Nonrealism. The conclusions we examined earlier—(1) and (2) in part 13—thus amount to this: there is no other notion of what it is to have systematic experience than the one available from that extrinsic order which is itself currently available to experience. But because of all that has gone before, it cannot be proved that this *must* be the sole order of reality.

This is where the Śaṅkarite wants to be for soteriological reasons. Here is why: he wants to claim two things.

  (i)   The reality of Brahman is not the experiential reality of the world; to experience the world is not to experience the reality which is Brahman.
  (ii) But at the same time, experience of the world is not, at the time of experience, illegitimate/invalid.

The usual challenge is to say that these are contradictory theses. If Brahman is the reality, then current experience is invalid. If current experience has valid standards, then it cannot be cancelled out in relation to Brahman.

The Advaitic strategy, then, is to secure a way of combining these theses. The Advaitin must show that

  (i') Current experience is not of the sole and determinate reality;
  (ii') but the standards for the validation of current experience are legitimate.

If (i') is correct, then it would be possible at least to make the claim that experience of the world does not exhaust what there is in reality, such that the possibility of experiencing some other order of reality— Brahmab—can be entertained. If (ii') can be defended, then the worry that all current

experience is somehow meaningless or empty—a skeptical and self-defeating stance par excellence—can be met, and accusations of self-refutation themselves refuted.

Our reconstruction of Śaṅkara's arguments leaves us with two moves:

(i*) Nothing that is available in our experience, that is to say, no knowledge claim which can meet the standards of the *pramāṇas*, allows us to claim that what is currently experienced can never be invalidated. This is the real lesson of the analogy of dreams. Dreams teach us that even with a consistent system for the validation of knowledge claims, nothing in what is experienced will allow of the noninvalidable assertion that what is currently experienced is the sole and determinate reality. Consequently, the soteriologi-cal claim, that this world is indeed subsumed by the reality of Brahman, cannot be gainsaid so easily.

(ii*) The system for the validation of claims arising from experience itself derives its authority from what is experienced. This was what the analysis of the *pramāṇa* theory taught us. The system of validation is legitimately applicable so long as that to which it is applied is the very same experienced world from which the system's authority is derived. Since the *pramāṇa* theory is understood in just this way—as being about the world from which its causal authority is derived—the legitimacy of the theory is limited to the currently experienced world. If all claims are valid or invalid because they succeed in or fail the tests of the *pramāṇa* theory (the system of validation), the validity of experiential claims is circumscribed by their being about the world that is experienced. The reality putatively behind the world would be legitimately and coherently known only according to standards derived from *it*, but these standards—the standards of yogis and realized souls—are currently unavailable to ordinary subjects.

It is clear that (i*) addresses the issue of (i'), and (ii*) that of (ii'). Alternative (ii*) also points to why nothing philosophical can be said about the nature of the ultimate reality: the standards required to know it are simply unavailable to us because we have not experienced that reality. On the other hand, we do have some sort of experience, which the transcendental argument has shown is possible only if it accords with the *pramāṇa* theory, and the claims to know which we make on the basis of that

theory are perfectly legitimate ones so long as they are about the objects of this currently experienced world.

This is why the epistemic modesty of the Advaitin ultimately leads to a quite radical conclusion about the possibility of an unexperienced order which will nevertheless not render empirical cognition invalid. From the point of view of the Kantian tradition, this leaves it as a matter of decision whether what results is a skeptical or an antiskeptical view of reality.

Concluding Philosophical Remarks

This, then, is the essential Advaitic position as I have sketched it and which I think most defensible. It may be characterized as being realist from an idealist point of view, idealist from a realist point of view, and skeptical about both points of view. It is realist because it asserts that the cognitive life can be explained only through the conception of an extrinsic, rather than a cognitively intrinsic, order. It is idealist because it holds that there is no proof that there must be an extrinsic order in whose absence there would be no cognitive life. Instead, it asserts that the existence of a systematic cognitive order can be ascertained only because there are, in general, objects of cognition. Therefore, even if it is logically possible that there is an uncognized order of objects, such an uncognized order will not be the determinant of the validity (or invalidity) of current cognition. If there is a determinant of such validation, it must be a cognized order. Advaita is skeptical of the idealist attempt to deny an extrinsic order. It maintains that the idealist disregards the extent to which cognition can go, namely, beyond the immediate or the particular cognitive instance. This is because the idealist merely presumes that there cannot be an extrinsic order. Advaita is also skeptical of the realist attempt to affirm the realist order. It maintains that the realist disregards the constraint on affirming anything about the extrinsic order, namely, that it is from the structure of the cognitive order that the conception of the extrinsic order is obtained; and that in turn is because the realist just presumes that there is an independent extrinsic order.

16 – I wish to thank an anonymous referee at *Philosophy East and West* for bringing Körner's writing on the subject to my attention.

17 – In construing transcendental arguments in this way, I have left aside another significant way in which the term 'transcendental argument' can be used: as the application of concepts to a transcendent reality, concepts borrowed from the "immanent" world of "supreme principles governing … belief about the world of intersubjectively interpreted experience," as Stephan Körner puts it, in *Metaphysics: Its Structure and Function* (p. 47). Körner argues that philosophers of different kinds have denied that such a conceptual grasp of reality is possible: by skeptics who deny any rationally justifiable grasp beyond subjective experience, by "antimetaphysical mystics" who hold such an application of concepts to be wholly inadequate, and by "metaphysical mystics" or "aesthetic metaphysicians" who think that conceptual application is at best metaphorical (p. 137).

18 – One further distinction must be mentioned: the one between 'representation' and 'presentation'. The representation of an object is what the subject 'makes' of that object (with the ambiguity about the ontological status of the object untouched). Representation is thus the subject's ordering in cognition of an object. The presentation of an object is the location/orientation of the object itself, such that it is accessible to the cognitive grasp of the subject. Presentation is therefore the ordering of the object such that the subject can cognize it. There can be

representation even when there is no presentation (for it may appear to the subject that there is an object when there is no object there).

20 – Ibid.

21 – More on this later; here I only wish to mention the harmless step I take from the singular to the plural so as to convey the sense of continuity betokened by talk of the two orders.

22 – Before going any further, I must note that the notion of superimposition was a controversial one in the tradition. The issue broadly was this: if there was a general requirement that there be objects for there to be cognition, how was error explained? More precisely, how was the possibility of cognition without its appropriate object (i.e., as in error) reconciled with the general requirement? Allied to this was another matter: a theory of how error occurred would elucidate the relationship between cognition and objects in general; if so, any such theory would lead to its own position on the nature of the cognized order of objects and as such result in a thesis on the metaphysical status of the world with regard to its independence from or dependence on, the order of experience. In Vācaspati, we find a discussion of error and superimposition as, too, of the sort of metaphysical status that consequently must be assigned to the order of objects.

23 – *prasiddho hy ayam bhoktṛ-bhogya-vibhāgo loke bhoktā cetanaḥ śārīro bhogyāḥ śabdādayo viṣayā iti* (Śaṅkara, *Brahmasūtrabhā☐ya* ll.i.13).

24 – Strawson, *Bounds of Sense*, p. 104 passim.

25 – This is not to deny that there may be interesting ways of relating the *svaprakāśā* thesis to the issue of a unified self, building as one could on the formulations Matilal has given regarding the views of the various schools on the issue of self-awareness; see Matilal, *Perception*, chap. 5.

26 – If the object were to be in the content of cognition itself, then the idealist thesis that objects are cognitive constructs would hold.

27 – Using Śaṅkara, *Brahmasūtrabhāṣya* ll.ii.28, pp. 552–553.

28 – *(api ca) ghaṭajñānaḷ paṭajñānaḷ api viśe☐anayor eva ghaṭa-paṭayor bhedo na viśe☐yasya jñānasya yathā suklo gauḥ kṛṣnorgour iti śaukl-yakarṣnyayor eva bhedo na gotvasya, dvābhyāṃ ca bhedaikasya siddho bhavaty ekasmāt ca dvayoḥ, tasmād arthajñānor bhedaḥ. tathā ghaṭadarśanaṃ ghaṭasmaraṇam ity atrāpi pratipatdvayaṃ atrāpi hi viśeṣyor eva darśana-smaraṇayor bhedo na viśeṣanasya gha-ṭasya. yathā kśīragandhaḥ kśīraraseti viśe☐yayor eva gandha-rasayor bhedo na viśeṣanasya kśīrasy etad iti* (Śaṅkara, *Brahmasūtrabhāṣya* ll.ii.28).

29 – By dispositionality I mean the tendency/ability of a subject to persist in taking some entity to be a particular, e.g., the *disposition* on the part of the subject to call that four-legged thing a horse through remembering a prior learning episode. The continuity implied by condition (2) is thus a continuity between a cognitive *episode*, where a four-legged creature is identified as a horse, and the *disposition* to continue to identify such a creature as a horse. In this way, a cognitive element—a 'horse-identifying episode'—becomes part of the cognitive order or, better still, becomes an ability to pick out certain other cognitive instances as having a horse as the identified object.

30 – There is much in the literature on memory, but, as with the issue of self-awareness to which it is closely related, it is beyond the purview of this essay.

31 – Of course, given the range of traditional scriptural issues with which Śaṅkara was concerned, he has plenty of other opponents as well whom he sees fit to criticize in the *Bhāṣya*, but we are not

concerned with them here.

DREAMS AND THE COHERENCE OF EXPERIENCE: AN ANTI-IDEALIST CRITIQUE FROM CLASSICAL INDIAN PHILOSOPHY

C. Ram-Prasad

I. INTRODUCTION

THE traditional realist claim is that objects that experience presents as existing externally, do in fact exist internally. The denial of externality appeals both to those who doubt that experience is ever veridical (in other words, who doubt that the objects experience presents are ever exactly identical with existing objects) and also to those who think that experience is veridical only if objects are not external.

Dreams hold an irresistible appeal for philosophers who wish to deny externality. Minimally, objects appear in dreams as occupying physical space. In other words, objects appear as distinct from the cognition of them. In particular, they do not appear as if they were in the subject's cognition alone, since to dream of an object is to dream of an object located in space. Both the Cartesian skeptic and the Berkeleyan idealist use dreams to challenge externality: a subject takes it that there is experience of a world of external objects, but there need be no such world as seems to be thus experienced. Cognition that there are external objects could therefore occur without such objects. But they draw two very different morals from this.

The Cartesian skeptic concludes that there is a doubt as to whether any cognition of external objects is veridical or not. The Berkeleyan idealist, in contrast, concludes that veridical cognition can occur without external objects. So the Cartesian skeptic presumes that verdical cognition requires that there is an external world to be grasped. Since dreams cast doubt on

whether there is such externality, they cast doubt upon the veridicality of cognition.

The idealist likewise accepts the doubt that dreams cast upon externality, but does not accept the implication of the non-veridicality of cognition. He therefore faces a different problem: that of providing a non-external guarantee of the veridicality of cognition. This disagreement about the consequence of denying externality was recognized by Kant. He distinguished, in characteristically idiosyncratic terminology, between Cartesian "problematic idealism" and Berkeleyan "dogmatic idealism."

Of course, there is much more to "dogmatic" idealism, even of the Berkleian sort, than the denial of externality. There is also the denial of material substance, the dependence of existence on God as Infinite Spirit, and especially the denial of mind-independent existence. However, this paper discusses only the idealist use of dreams as a denial of externality and the anti-idealist responses that can be made to it. The idealist doctrine I discuss is Vijñināvāda, as endorsed by the Buddhist Vasubandhu (4th–5th century), rather than Berkelyean idealism, although Berkeley's characterization of external space as "that phantom"[1] sits rather well with Vijñānavāda. And the anti-idealist response I discuss occurs in the Advaitin Śankara's works (from the 8th century), primarily, the *Brahmasūtrabhāṣya and the Bṛ had āraṇ yakabh āṣya*.

Vasubandhu is an idealist in a sense given by his own characterization of the Vijñānavāda position: "that which is distinguished does not exist thus; all is therefore mere representations in consciousness" (*yad vikalpyate tena tan-nāsti tena-idaṃ sarvaṃ vijñapti-mātrakaṃ*).[2] Experience presents us with a distinction between consciousness itself and the objects of which we are conscious. But such objects do not exist as thus experienced; they are mere appearances. As one of Vasubandhu's commentators puts it: "mere appearance is that in which the object, as it is conceived in cognition, is absent."[3] Vasubandhu uses dreaming to claim that an account of experience does not need this cognition-object distinction. He claims that such an account is independent of the notion of objects being external to cognition.

A point of clarification: I have called Vasubandhu an idealist only for the reason that he denies that experience requires any conception of external objects. In that sense, I have taken up only the first half of his thesis: that there are no objects as there seem to be in experience. This is because my paper is strictly limited to the question of providing an account of

experience. But there is indeed the second half of the thesis: Vasubandhu says of the consciousness of objects, "its object is not there, and that object being absent, it too is not there." This is more than a mere idealism about external objects. Clearly, this is not just not realism, it is not idealism either. Not only are objects denied but, ultimately, the consciousness of them as well. When both are denied, there is the powerful mystical concept of that "emptiness which is the basis of purity" (*śūnyatā hi viśuddhi — ālambana*). But I have consciously avoided making this an examination of rival soteriological doctrines. As a result, I have entirely avoided as well the issue of whether ultimately Vasubandhu need be thought of as an idealist. I accept the anticipated criticism that in some profound sense he is not an idealist. All I want to say is that he is an idealist in the limited sense in which I have described him. And it is this idealism that I take to be the object of refutation in these pages.

I have previously dealt in detail with Śaṅkara's general anti-idealist arguments in the *Brahmasūtrabhāsya*.[4] This paper analyses and reconstructs that particular section of that text which specifically targets the idealist use of dreams.

Śaṅkara's refutation of Vasubandhu is terse. Yet not only is it penetrating, it also illustrates the tenability of this type of a refutation.[5] This paper has roughly two stages to it. The first stage, in section II, concerns Vasubandhu's claim that dreams show that there can be experience even when external objects are specifically ruled out. Śaṅkara argues that dreams cannot be understood except on the assumption of the very notion of externality which Vasubandhu wishes to deny. The second stage, covering sections III and IV, deals with the issue of externality in general. There I shall argue that the disagreement between the two schools is over the role of the conception of externality in any account of experience. They are agreed that there can be no proof of externality. The Advaitin wishes to say that an assumption that there is an external world, i.e., the *conception* of externality, is needed for any account of experience. The Vijñānavāda, on the other hand, argues that there can be no distinction between consciousness and its object, and that therefore the very conception of externality is illusory and must be rejected before any coherent account of experience can be attempted. I shall examine and attempt to defend what I take to be the Advaitin's refutation the Vijñānavāda's thesis. In the final

section, I shall take a look at the consequences of idealism about external objects for the Vijñānavāda's philosophy.

II. ŚAṄKARA'S CRITIQUE OF VASUBANDHU'S USE OF DREAMS

Vasubandhu uses dreams to refute a version of realism that proceeds in terms of an atomistic account of external objects. This atomistic account holds that experience (especially perceptual experience) is caused by entities constituted by atoms. Ultimately therefore, atoms cause perception of those very objects that they (the atoms) constitute. Vasubandhu argues[6] that atoms could explain the perceptual experience of putative objects (constituted by those atoms) in only one of three ways, none of which is tenable:

   (i)   They act atomistically as a set of discrete atoms so as to cause perception as of parts.

   (ii) They act non-atomistically as a whole so as to cause perception as of a single whole entity.

   (iii) They act non-atomistically as single aggregation of atoms so as to cause perception as of an aggregate.

(i) is quickly eliminated because experience is not as if of a swarm of atoms but is as if of objects.

Vasubandhu's argument against the possibility of (ii) is this:[7] On the atomistic picture, to say that atoms constitute an object is to say that the various qualities of an object are made up of quality-atoms. For example, the blueness of a blue object is constituted by blue-qualia atoms. On the atomist's account, then, the cognition, "this is blue" must be caused by blueness-atoms forming a "color-whole." But of course, this is not how experience occurs; the color is not experienced as different from the parts of the object experienced. We do not perceive the blueness of a table independently of perceiving parts of a blue table or blue parts of the table. So, the atomistic picture cannot accommodate the perception of wholes.

There remains (iii), namely, the possibility that experience is perception of an aggregate of atoms. Vasubandhu now switches from arguments about

the commonsense nature of experience to the argument that (iii) can be true only if the atomistic view is incoherent. The argument is this *reductio*: if atoms are to come together to constitute an object, they must come in contact with one another, in which case the contact must be either partial or whole. They cannot be in contact wholly because whole contact is nothing but identity, and if there is identity in the occupancy of two atoms, that would only be to say they are the same atom, in which case there would be no such growth in dimension as is required to go from atomicity to whole objects. So dimension requires partial contact, i.e., contact of parts of atoms, such that parts not in contact can create size. But this would be to go against the primary definition of atoms as partless wholes. (And they need to be so defined because so long as they have parts, they can be divided; and if they can be divided they cannot be the ultimate constituent entities that they are required to be.) So the atomistic hypothesis, that an object is an aggregate of atoms, is itself unintelligible.

Vasubandhu concludes that cognitions such as color-perceptions cannot be explained in terms of objects whose qualities (such as color) are constituted atomistically. His alternative to explaining cognitions in terms of atomistically constituted objects is that in general, cognition occurs without objects at all (*vinā api arthena-iti prūvam-eva jñāpitaṃ*). Dreams are then used as a reason for accepting this general claim.

Here Vasubandhu's strategy departs interestingly from Berkeley's. Vasubandhu uses dreams for the express purpose of denying externalism. By contrast, although Berkeley mentions the non-externalist consequences of dreams,[8] he does not build an idealist argument around them, preferring merely to take them as the perfect metaphor for non-external experience in which ordinary perception of things is "a kind of waking dream."[9] In this respect, Vasubandhu's strategy is more Cartesian than Berkelyean, although (as noted in the last section) the difference between Vasubandhu and Descartes is that for Vasubandhu, dreaming is a reason for an idealist conclusion, rather than part of a skeptical method of systematic doubt.

Exactly how do dreams provide the grounds for idealism? In the *Vijñaptimātratāsiddhiḥ* ("The Doctrine of Consciousness-alone"),[10] Vasubandhu points out that in dreams experience can be internally systematic and can thus systematically represent objects even if the objects represented don't have an external existence. Dreams therefore demonstrate

the dispensability of objects in the analysis of cognition: externality is refuted.

Vasubandhu anticipates an objection to this conclusion. The objection, in the mouth of an imaginary opponent, is that experience displays the following three features: (i) spatiotemporal regularities, (ii) causal regularities, and (iii) inter-subjective consistency. This last refers to our impression that, in specified spatiotemporal locations, others appear to experience the same objects (given a suitably complex understanding of sameness) that we do. But, continues the objection, if dreaming and waking experience both lacked externality, but had these three features in common, then they would be indistinguishable. Consequently, spatiotemporal, casual, and intersubjective regularities would extend from one to the other indiscriminately: a dream-apple could be eaten with satisfaction when I woke up. Since this is false, there'must be a difference between dreaming and waking that guarantees that these three features hold only for waking experience. That difference can be only externality.

This objection fails. It argues that dreaming and waking experience can be distinguished only by the criterion of externality. But that is not a problem for Vasubandhu. Although he admits that (i) to (iii) are incontestable features of experience, he points out that these features can occur *within* dreams (without externality) perfectly consistently: my dream-eating of the dream-apple can dreamingly satisfy my dream-hunger. So since the three features can be accounted for in dreaming, without appeal to externality, then externality is not needed to account for those features per se, and hence is not needed to account for them in waking experience either. This response, of course, requires Vasubandhu to distinguish between waking and dreaming through criteria other than externality, because otherwise he would have to say a dream apple could satisfy a waking rather than a dream hunger, and this is a consequence he plainly wants to avoid. It seems obvious that Vasubandhu can meet this requirement. He could cite other criteria, such as clarity or long periods of consistency, which distinguish between dreaming and waking experiences. Admittedly, Vasubandhu himself fails to see the need to do so. Nonetheless, nothing in Vasubandhu's position commits him to give up the distinction between dreaming and waking. Assuming that he can base the distinction on criteria other than externality, the first objection indeed fails.

This clears the way for Śaṅkara's critique. The crux of the critique is not that the features of experience require externality. Rather, the problem is that externality is itself a feature of experience. Unlike Vasubandhu's imaginary opponent, Śaṅkara quite rightly acknowledges that the idealist can distinguish between dreaming and waking, but claims that the consequence of that distinction is problematic: "It cannot be asserted by a man who comprehends the difference between the two [sorts of experiences] that the apprehension of waking experience is false [as to its externality] just because it is an apprehension resembling that in a dream."[11]

The force of this objection is best appreciated by first restating the idealist argument from dreams semi-formally:

> (P1)   Dreams occur without external objects.

So (C)   Dreaming experience requires no externality.

So (C′)   Experience can therefore occur without externality.

So (C″)   Waking experience can occur without externality.

Śaṅkara argues against this:[12] "One who cannot establish the absence of objectual support [i.e., external objects] (which is the characteristic) of waking experiences should not try to establish such an absence of support on the basis of (their) similarity to dreaming experiences."

Śaṅkara's point is that, even if Vasubandhu can distinguish between waking and dreaming without reference to externality or objectual support (as he clearly can), he cannot go on coherently to deny externality as a criterion of waking experience altogether. In other words, the inference from (C′) to (C″) is invalid. For Vasubandhu's denial that waking experience needs externality is grounded by the claim that dreaming lacks externality. But Vasubandhu acquires the *concept* of externality from waking experience, in order to then deny that externality is a requirement of coherent experience. Śaṅkara objects that this move commits the fallacy of the ineffective major term (*sādhyavikala*):[13] "If a characteristic is not itself (proven to be) constitutive of the identity of an entity, it cannot be adduced as being possessed by that entity on account of that entity's similarity to another entity which does possess that characteristic."

The major term is the predicate of the subject in the proposition to be proved in the Indian inferential process. Therefore it denotes the

characteristic of the entity whose existence or nature is to be established. Śaṅkara's objection can be better appreciated as the point that the idealist is committed to the following argument:

(P) Waking experience (*W*) features the various qualities (*A*) of objects and their appearance of externality (*B*) (undeniable nature of experience). I.e., *W(A,B)*

(P2) Dreaming experience (*D*) features the various qualities (*A*) of objects and their appearance of externality (*B*) (which is why dreams resemble waking experience). I.e., *D(A,B)*

(P3) But dreaming (*D*) experience features the various qualities (*A*) of objects and their appearance of externality (*B*), but there is no actual externality (~*C*) (admitted by all). I.e., *D(A,B,~C)*

(P4) There is experience of the various qualities including externality without there being actual externality in dreams. I.e., *D(A,B,~C)*

(C) Therefore, there can be experience of qualities including externality without there being actual externality in waking. I.e., *W(A,B,~C)*.

This is of the form:

(P1) Wherever there is *W*, there is *A,B*;

(P2) Wherever there is *D*, there is *A,B*;

(P3) But wherever there is *D*, there is *A, B*, and ~*C*;

(P4) There is *A,B* and ~*C*, in *D*;

(C) Therefore, there can be *A, B*, as in *W*, and -*C*.

Since this argument-form is valid, any attack on the idealist's argument must focus on the epistemic role of the aquisition of the concept of externality, which that argument requires. This anti-idealist attack first establishes the *general* point that since *C*-ness has not been shown to be part of the identity of *D*, it is epistemically unjustifiable to conclude that C-ness is not a characteristic of *D*, merely on the ground of *D*'s similarity to *W*, which is non-*C*. The conclusion is unjustifiable because it makes it impossible to acquire the concept of *C*-ness. This point is established by invoking the parallel between it and the following argument:

(*P1*) Wherever there is a cow, there are four legs and two ears.

(*P2*) Wherever there is a horse, there are four legs and two ears.

(*P3*) But wherever there is a horse, there are four legs, two ears and no horns.

(*P4*) Four legs and two ears can be found wherever there are no horns, as in a horse.

(*C*)　Therefore, there can be four legs and two ears, as in a cow with no horns.

At this point it is important to note that both the idealist and his opponent assume both that the argument is not about counterfactual hornless cows. More importantly, both further assume that the universe is exclusively divided into horses and cows. This admittedly artificial assumption is justified, because it is needed to preserve the parallel with the original argument from dreams. In that argument, we are indeed justified in assuming that the universe of experience is exclusively divided into waking and dreaming.

The Śaṅkaritegeneral objection is now establised by example. It becomes the specific objection that since hornhood has not been shown to be part of the identity of a cow, it is epistemically unjustifiable to conclude that hornhood is not a characteristic of cows merely on the ground of their similarity to horses, which are not horned. The conclusion is unjustifiable because it makes it impossible to acquire the concept of hornhood. If one has encountered only horses, then one could not deny that cows have horns, because one needs prior encounters with cows in order to acquire the concept of hornhood. In other words, one's experience of non-horned horses can support a coherent denial that cows have horns only if one has the concept of hornhood. But one could have it only by experiencing horned cows, so the denial is coherent only if it is false.

Now that the Śaṅkarite general objection is established, it can be used against the argument from dreams. Since the idealist has yet to prove that the cognition of externality (its appearance) in waking is unsupported by external objects, he cannot derive the non-externality of objects in waking from the non-externality of objects in dreams, from the mere fact that dreams and waking have *other* features in common (like causal regularities). Moreover, the fact that the cognition of dreams is consistent

with their non-externality does not entail that waking experience can be explained without reference to the concept of external objects. Waking experience is required for the concept of externality, before externality can coherently be denied of dreams. It is thus incoherent to deny the externality of that (waking) experience from which the very concept of externality was first derived.

This objection effectively disposes of all idealist arguments denying externality *on the basis of dreaming experience*, such as the following argument in Berkeley:

Philonous: Do you not in a dream to perceive like objects?

Hylas: I do.

Philonous: And have they not then the same appearance of being distant? [or "outness," both of which are terms Berkeley uses to signify externality].

Hylas: They have.

Philonous: But you do not thence conclude that apparitions in a dream to be without the mind?

Hylas: By no means.

Philonous: You ought not therefore to conclude that sensible objects are without the mind, from their appearance or manner wherein they are perceived [i.e., as though they were outside, or external to the mind].[14]

The Śaṅkarite objection to this now becomes that the coherence of the very debate requires the clear understanding that dreams do not require external objects, but this understanding requires a grasp of the concept of external objects, as in waking experience. But Philonous goes on to deny that experience gives us any cause to think that objects are external, precisely on the basis of the presupposed non-externality of dreaming objects. The strategy of Śaṅkara's objection resembles that of the objection against Berkeley's argument from to the physiology of the eye to te denial of externality: his reasoning concerning space presupposes the existence of the very space he intends to deny.[15]

Vasubandhu might try to disarm the ankarite objection by reformulating his argument from dreams as a reductio, since then the fact that its

conclusion contradicts its supposition is entirely welcome. But the argument cannot be a reductio. If it were, it would have to be of the form:

(i)   It is the case that *p*;

(ii) If *p* then *q*;

(iii) If *q* then *r*;

(iv) But if *r* then *not-p*;

(v)   Therefore *not-p*.

Any such reductio succeeeds only if the conditional in both ii) and iii) is of the form "it must then be." But neither premise can be of this form in Vasubandhu's argument from dreams. That reformulated argument begins:

(*P1*) It is the case that experience occurs with (or "has") externality.

(*P2*) If experience has externality then it has other regularities.

Leaving *P3* aside for the moment, it continues:

(*P4*) But if there is dreaming experience, there is no externality.

(*C*)   Therefore it is not the case that experience occurs with externality.

Clearly, the argument can work only if *P3* is taken as

(*P3′*) If regularities occur it *could* then be dreaming experience

which is clearly a different claim from that required, namely:

(*P*) If regularities occur, it *must* then be dreaming experience.

Whatever the hardness of the "must," on no consistent construal would it be softer than the "could." So given *P3′* the conclusion has to be modified to something like

(*C′*) Therefore it might, or need, not be the case that experience occurs with externality.

But given that modification, the resulting argument is not a reductio at all.

III. ŚAṄKARA AND THE CONCEPT OF EXTERNALITY

Although the Śaṅkarite position is antiidealist, it is not realist in the sense of proving that the objects of experience are independent of such experience. So the idealist can protest that Śaṅkara establishes merely that waking experience is needed to have the concept of externality, on the ground that the externality of objects is a feature of waking experience. But the idealist could argue that the availability of the concept of externality is consistent with the fact of non-externality, even if it is not consistent with the coherent assertion of that fact. So all that the idealist needs is an account of experience that is consistent with the absence of externality. The price of giving such an account is abandoning the analogy of dreams, one well worth paying.

This new line of thought does not worry the Advaitin and his anti-idealist argument. It does not worry the Advaitin because he aims to show that accounting for experience requires the *assumption* of externality. This does not commit him to *establishing* the externality of objects, a task which he thinks is impossible. An anti-idealist about the denial of externality, he is equally an anti-realist about its assertion. For him, the issue is not the ontological status of objects but the concept of externality, seen as, and given by, the distinction between cognition and its object: "Since you admit dreaming experience to occur, you must admit that its content, the objects of dreaming, are distinct from awareness, whether you wish to term them "real" or unreal."[16]

The disagreement between the Advaitin and the Vijñānavāda could be misunderstood here, and consequently misrepresented. At first sight, the Advaitic argument against the Buddhist use of dreams looks like the claim that externality is required for experience, a claim that is clearly not established: there has been no demonstration that a world of objects, proven to be external to cognition, is required for experience. The grounding of *that* claim is not a matter of disagreement between the Advaitin and the Vijñānavāda. Both deny that there is a proof of an external world, though seeing this requires close attention to Śaṅkara's argument.

Having recognized this agreement, what can the Advaitin hope to achieve with his claim that externality is given in experience? What is the sting in the claim that the *assumption* of externality alone is needed, if the idealist can establish non-externality by means other than the analogy of dreaming? Indeed, the idealist can claim to have established the dispensability of

externality in his account of experience in just this way. All that needs to be done is to take Vasubandhu's argument that regularities and intersubjective constancy need no externality and drop the discredited attempt to do this via dreams. Indeed, any account of experience that dispenses with externality is good enough for this purpose. Vasubandhu's own phenomenalist work, the *Abhidarmakośa*,[17] for example, reduces objects of experience to the qualia of the appropriate senses. Alternatively, a modern defender of Vasubandhu could endorse Berkeley's elaborate demonstration in *An Essay Towards a New Theory of Vision*[18], that there can be perception of distances or outness (i.e., externality) even when the idealist ontology includes no such objects, but only ideas of the mind (even if the "Mind" is of a god).

The crucial point of disagreement then, between the Advaitin and the Vijñānavāda, is not that the Advaitin claims that

(i)   The proof of externality is required by any account of experience

but rather that he claims that

(i)   (ii) Some *assumption* or *concept* of externality is required by any account of experience.

(i) ontolologically commits its proponent either to (1) the realist position that there is a world of objects external to cognition (proof of whose existence would alone render any account of experience coherent) or to (2) a skepticism about realism, holding that no coherent account of experience is possible (because no proof of an external world is possible). Admittedly, many Advaitins have defended (1) elsewhere, but (as I have previously argued[19]) Śaṅkara himself eschews this position.

The idealist agrees with the Advaitin in rejecting the possibility of any proof of externality. Nor do they disagree in the sense that they provide *competing versions of the concept of externality*. It would therefore be misleading to situate the idealist's position on the experience of externality, in a broadly anti-realist framework. Rather, while the Advaitin claims (ii), the Vijñānavāda denies this, *on the ground that the very **idea** of externality is illusory and therefore should play no role in any account of experience*.

Vasubandhu's commitment to this ground is clear. His crucial claim about the nature of experience is that it involves the imagination of that which is not the case (in other words, the conception of the nonexistent (*abhūtaparikalpa*)). What *is* it that is not the case (or, what is it that is

unreal)? It is the distinction between that which is grasped and the grasper (*grāhya-grāhaka-vikalpaḥ*), i.e., consciousness and its object. Vasubandhu rejects the reality of this distinction because it entails that the conception of the grasped is different from, *or external to*, the grasper. Clearly Vasubandhu cannot afford to accept *that* distinction between grasper and grasped. Given his position, this is not merely the claim that no externality can be proved; it is the stronger claim that externality can be proved to be unreal or illusory: "determination of space, etc. is obtained just as in a dream" (*deśa-ādi-niyamaḥ siddhaḥ svapnavat*);[20] i.e., externality (spatiality) is illusory. So whether or not his argument from dreaming is tenable, Vasubandhu's point about space is clear: it is illusory. There is no space in which objects exist, because there is no distinction between objects and the cognition of them. So Vasubandhu is not calling for an account of experience in which externality (i.e., spatial distinction between object and cognition) can be translated into some non-realist framework. He is asking for the rejection of the role of spatial distinction on any account.

Vasubandhu starts the *Vimśatika* by telling us: "There is merely representation in cognition because there is merely the appearance of non-existent objects" (*vijñapti-mātrametad-asadartha-avabhāsant*). This is an affirmation that there is no externality. Now if it is *affirmed* that there is no externality, then it would not be consistent to *assume* that there is. One can claim *merely to assume* externality only when one lacks proof of either its existence or its non-existence. Vasubandhu's point is that externality is illusory and so should be rejected. Vasubandhu does not want to assimilate the experience of externality into a theory of coherent experience; he rejects any account whatsoever which would allow for that cognition- object distinction that constitutes the concept of externality. "Whatever matter is liable to be distinguished by some sort of [cognition-object] discrimination is just imaginary as to its nature, [for] it does not exist thus" (*yena yena vikalpena yad yad vastu vikalpyate/ parikalpita-eva asau svabhāvo na sa vidyate*).[21]

On the other hand, to assume externality one should at least not affirm that it is illusory. If it is already affirmed, as a consequence of the idealist argument, that externality is illusory, it would be contradictory to thereafter assume its reality. One must at least grant that experience does in some way ground such a distinction (though, as a non-realist, an Advaitin could and does later go on to say that that distinction cannot actually be proven.) This

is what we find Sankara saying at the very beginning of his work: the natural experience of the world (*naisargiko 'yam lokavyavahāraḥ*) evidently seems of the form of a subject being the recipient of presentation (*asmat-pratyaya gocare viṣayinī*) that are distinct from non-subjective presented objects (*yusmad-pratyaya gocare viṣayaḥ*). For him, therefore, experience is explicable only when the appearance of the cognition-object distinction is assumed. I have argued elsewhere that he does give an account, albeit a brief one, of how the assumption of externality can work within a general account of experience; an account, I claim, that has some resonance with Kant's.[22]

What is relevant, however, is that Vasubandhu not only does not want to account for externality in some non-realist way, he specifically claims that externality is illusory. If externality is affirmed as illusory, obviously it would not do to *then assume* that it exists, for it would be contradictory to do so. So a coherent account of experience must perforce reject any role for externality, assumed or real (objects…are distinct from awareness, *whether you wish to term them "real"or "unreal"*[23]). Consequently, Śaṅkara's attempt is not to show that Vasubandhu is wrong in rejecting proof of externality, for Śaṅkara himself accepts that rejection. To say that ankara's argument does not prove that externality exists would be to miss the point. His attempt, rather, is to show that Vasubandhu is wrong to reject the role of an *assumed* externality in any account of experience. So the argument is over whether it is correct to reject the very assumption of externality in a coherent account of experience.

IV. THE GENERAL ARGUMENT AGAINST IDEALISM

This is where we find Śaṅkara's argument telling, over and above his point against dreaming. Śaṅkara mentions Diṅnāga's view on the matter. Diṅnāga, like Vasubandhu before him, is attempting to explain the "manifold of experience" (*pratyayavaicitryam*) without reference to the concept of externality; the general idealist claim is that there is no perceptual grasp of anything distinct from that grasp itself.[24] Diṅnāga

maintains:[25] "That which has only an intrinsic, cognitive form appears as though it were external." The significance of this claim lies in the fact that it is supposed to contribute to a coherent account of experience. The idealist thesis is supposed to articulate the claim that experience can be accounted for without the assumption of externality. Śaṅkara, however, points out that the thesis cannot articulate the claim that experience can be accounted for without reference to the *concept* of externality.

He points out that "there is experience [or awareness — *upalabdhi*] and *a fortiori*, [the] distinction [of something] from experience must be admitted. Nobody experiences a [perceptual] experience of a pillar, a wall, etc.; rather people have experience of objects of experience as [being] a pillar, a wall, etc.[26]

The very nature of the experience of a pillar is of it *as* an external pillar (a pillar as an object of cognition). What exactly is the case Śaṅkara is making? After all, the idealist does not deny that there is the perception of externality. If this is so, what is to be gained from belaboring the point that experience does represent externality? The terse answer is this: Śaṅkara is saying that there can be no way in which an idealist can claim that experience is coherent on his account. The idealist's account, remember, is one in which the very notion of externality is denied any explanatory role. Indeed such externality is specifically taken to be illusory.

Experience of a world is coherent in an account of what is experienced, only when that account allows for cognitions — individual experiences of objects — to meet the requirements of the *pramāṇas*.[27] Briefly, this is what is meant: the *pramāṇas* are the various instruments by which knowledge is gained: perception and reasoning (to be more specific, inferential reasoning) being the commonly accepted ones. They are the modes of cognition (or ways through which the subject-object relationship of experience is established), and a cognitive episode or experiential event is knowledge-instantiating (is a *pramā*) if it does not deviate from the requirement for a true cognition. Non-deviation consists in sequences of cognitions (experience) being invariably correlated with the object of cognition.[28] One may say that cognition is knowledge-instantiating when the subject "tracks" that of which there is cognition. I use the familiar term "tracking" to describe the awareness of that invariable correlation between object and cognition that the Indians called "non-deviating" cognition. That

is to say, if the subject's cognitions of a specified object vary concomitantly with the varying location and qualities of the object, then the subject is able to make a true knowledge-claim; the subject has fulfilled the requirement that her cognitive states be sensitive to the state of the object in question. The nature and specification of the invariable concomitance or correlation will vary depending on the instrument or mode in question.[29]

The tests for non-deviation, i.e., the criteria for determining when exactly "tracking" has occurred successfully, are often the same for most schools (though some may vary from school to school). I do not wish to go into that issue here. I will simply say that the criteria used by the Buddhist schools are not always acceptable to the brahmanical schools (though all are agreed that the invariable concomitance must be established). In this paper, I will assume the legitimacy of various criterial sets (especially that of the Buddhist Vijñānavāda in question). The *pramāṇa* theory then specifies various modes of cognition and the requirement (with possible multiple criteria) for a cognition to be knowledge-instantiating. The theory therefore provides for a system by which cognitions can be determined to be veridical or erroneous. I therefore call the *pramāṇa* theory as a whole a system of validation, the validation of knowledge-claims.

Let us take validation to be the systematic distinction between true and false claims. Now, we can say that experience is coherent only if it is possible to apply the system of validation to cognitions and determine their status as veridical or erroneous. If it is impossible to test whether cognitions track their objects, then experience must be thought to be incoherent. To put this in another way, if the instruments of cognitions provide no general tracking except in specific cases of error, then experience must be thought to be incoherent. It follows that my *particular* account of cognition (i.e., one propounding a particular ontological position on what is experienced) in which the veracity of cognitions cannot be established must be seen as one committed to portraying experience as incoherent.

We may put the matter generally this way. Take any ontologically neutral statement of an experiential event (A) and an ontologically interpreted statement on what that event consists in (A'). Then, only if A' is true by the standards of the *pramāṇa* system would A be true. That is to say, only if the particular ontological position on the nature of experience (a sequence of cognitions) meets (through favored criteria) the requirement of the system of validation, can A be true. Conversely, if A') is determined to be false,

then *A* is false. The point is that any particular such *A'*) must be testable by the standards of the system of validation, so as to generate the truth-evaluated conclusion about the corresponding, neutral statement *A*. Since *A*) is neutral in the sense that it is faithful to the common features of experience, if its truth or falsehood is just the truth or falsehood of the corresponding ontologically interpreted statement *A'*, we can say that that ontological interpretation "saves the appearance" that *A* captures. In other words, if *A'*'s being true or false varies just according to the *pramna*-bound evaluation of the particular ontological account given in *A'*, then *A'* allows for systematic distinction between veracity and error, and therefore presents experience as coherent. All schools wishing to claim that experience is indeed coherent, and thus not systematically illusory, must be able therefore to provide for A's truth-evaluation solely in terms of the *pramāṇa*-bound evaluation of their particular account given in *A'*).

   Given this condition of the coherence of experience, let us look at a particular experiential state, that of a white, carved stone pillar. Suppose this results in the ontologically neutral statement,

   (*A*) There is a white, carved stone pillar.

This statement is ontologically neutral in that (i) it would be acceptable to all schools that accept that experience is coherent, whatever their ontology; and (ii) more importantly, it is the one acceptable to "all people" in "ordinary" experience, i.e., in a pre-theoretical way. The statement's truth-value must be preserved in any account of the relevant experience (or, strictly, experiential state); this is only to apply the requirement of *pramāṇa*-evaluation to test whether an account of experience can present that experience as coherent. Now, the idealist would analyze the experience thus:

   (*A'*) There is a cognitive construct/representation that there is a white, carved stone pillar.

To test whether the neutral statement *A* is true, the idealist would have to apply (his selected) criteria of the *pramāṇas* on the relevant idealist analysis of experience *A'*). These criteria for determining non-deviation are tenable: successful action consequent on judging that *A* (which is really a pragmatic test of causal consistency), inter-subjective consistency, continuity in cognitive representation, and so on. Let us, in any case, allow the idealist

the ability to perform truth-tests of these types on cognitive constructs. Suppose then that the tests are successful and it is concluded that there is an experience that there is a white, carved stone pillar that satisfies the criteria. Then, the subject has knowledge that there is such a pillar. If so, we may hold that the statement *A* "There is a white, carved stone pillar" is true. What has happened is that the idealist account seems to have satisfied our coherence requirement. The idealist analysis of experience is in terms of cognitive construction. The analysis given accounts for how a statement on experience can be true, and seems to do so via the use of the *pramāṇas* on experience (where experience is interpreted as being of cognitive constructs).

(*A*) "There is a white, carved stone pillar" is true is invariably concomitant with

(*A′*) It is *pramāṇa*-true that there is a cognitive construct that there is a white, carved, stonepillar.

A′) being true, there is knowledge that there is a white carved stone pillar. An account has been given in which the truth of *A* has been accounted for in terms of knowledge that *A′* is ture. Experience is coherent on the idealist account, i.e., on the account given by the idealist interpretation *A′*.

This is where Śaṅkara's argument is relevant.

> There is experience (or awareness — *upalabdhi*) and *a fortiori*, [the] distinction [of something] from experience must be admitted. Nobody experiences a [perceptual] experience of a pillar, a wall, etc.; rather people have experience of objects of experience as [being] a pillar, a wall, etc.

His point about the externality represented in experience can be understood by looking more closely at *A* to see whether it is the best candidate statement to represent *neutrally* the experiential state. His claim is that it is not. It is not, because, though it seems satisfactorily to represent the experience, a closer analysis reveals an elision in the statement. Even though *A* is the form one may colloquially give to the statement regarding the relevant experience, what one must actually state, if one is to be more accurate, is something like

(*B*) There is a white, carved stone pillar (five feet and directly) in front (of me or my line of vision).

This is simply to say that the statement must be about not only the qualities located in the pillar but the pillar as an *object*: in other words, not only about the pillar but the pillar as other than a perceptual/cognitive state itself. To say that the pillar is in front of me is to say that it appears to be located other than in — and therefore distinct from the contents of — my own mental space. Now, *A* is of a form in which every quality — shape, color, pattern and so on, can indeed be reduced to appropriate perceptual states, perceptions of an hexagonal cross-section, whiteness, diagonal lines, etc. *But A is deceptive*. When giving the qualitative appearance of the pillar, it suppresses the quality of the pillar as appearing to be external. The pillar, after all, also has the quality of appearing in experience as occupying non-metaphorical space, but this is not given in A. Being in such a space is also a quality the pillar possesses.

The idealist can now object: it precisely is his point that objects appear as if they were external, and he has never denied that. In fact, it looks as if *B* plays right into his hands, for in bringing out the cognition of externality, Sankara seems to have provided an even better candidate for the idealist translation of the experiential state. Thus:

(*B*) There is a white, carved stone pillar in front is analyzed as

(*B′*) It is *pramāṇa*-true that there is a cognitive construct that there is a white, carved, stone pillar in front.

In that case, the same, idealistic conclusion is held to follow, on the grounds that there is nothing incoherent about the possibility of a cognitive construct that there is a pillar in front of the subject.

The idealist's aim is to show that the concept of externality plays no role in an account of veridical experience (where veridicality is *pramāṇa*-true). This concept plays no role because, as we saw, it is explicitly seen as an illusion, and *the illusory cannot be part of an account of the veridical*. So the idealist is committed to showing that the experience of externality (i.e., that feature of experience that takes the form of representing objects as distinct from cognition) is in fact to be explained specifically without recourse to the concept of externality. If the account is to be free of any appeal to that concept, then it must explain the experience of externality in

terms of something else. This something else is the cognition itself. In the case at hand, it is the perceptual state of seeing. So the idealist's aim must be to account for such an experience, as is represented in B, explicitly through a concept that makes no use of the notion of externality (and of course, a perceptual state, which is a state of the subject's consciousness, cannot, by definition, be an application of the concept of externality, for the latter necessarily requires an object separate from the subject).

That is to say, if there is only a perceptual state (a cognitive construction of a white, carved stone pillar), then there would be an account of that pillar in which there is no role for the experience of a pillar as external. According to the Advaitin, however, this is just what is wrong about the idealist analysis. The concept of externality, applied to the perception that the pillar is in front, cannot be reduced to a concept that does not involve externality, namely the concept that there is only a perceptual state. Let us see how the Advaitic objection goes. Suppose that the idealist applies his favored criteria to check the validity of B'. Suppose too that B' is validated.[30]

So B' is validated using certain criteria whose legitimacy we have granted to the idealist. If so, then it is known that B'. *But if B' is true, then B is false.* If it is true that the pillar's being in front of me is truly part of a cognitive construct, then it is false that there is a pillar in front of me, because, if the pillar were indeed in front of me, it would be separate from me and therefore not a cognitive construct of mine. In fact, every neutral statement regarding the experience of objects being external is false if the idealist translation of the neutral statement on experience is true. Whatever the conclusion regarding the validity or invalidity of a particular idealist translation of a cognition of an external object, the corresponding neutral statement on experience will be false. Every statement of the form B'), which rejects the role of the concept of externality, requires the corresponding neutral statement B to be false, since B representing what B' implies is an illusion.

But now, if every such statement is false and yet the idealist insists on the legitimacy of his analysis, then experience cannot, on his account, be coherent. Experience *seems* to distinguish between correct and erroneous cognitions, between true and false statements about experience, but on the idealist view, experience is *in reality* always erroneous in its representation of externality.

V. THE DIFFERENCE BETWEEN SKEPTICAL AND IDEALIST STRATEGIES AGAINST THE CONCEPT OF EXTERNALITY

It does not matter, then, that the idealist can give an account of how perception seems to be *as if* of external objects, by using such notions as consistency, regularity, etc.; as long as a constitutive part of his thesis is that the concept of externality (which is just the application of the subject-object distinction to any account of experience) is illusory, then he is committed to saying that experience is systematically mistaken.

This conclusion is particularly galling to the idealist seen in the light of Western anti-skepticism. When the skeptic argues that we may be in error in judging experience to be of external objects, a reply that in fact we assuredly are in error to so judge seems singularly pointless. The situation is more complex with Vasubandhu. For it may well be that he is quite happy to accept the conclusion that experience is incoherent. After all, the case may be made that his arguments are really skeptical in intent.[31] This depends, of course, on what is meant by skepticism in this context. One form, found in Indian thought but not too obvious in the West, is a sort of "transcendental skepticism." It is the view that it cannot be determined that there is no other experience than the current (coherent or incoherent) one; it cannot be determined as to whether what current experience grasps is a determinate reality. Some Advaitins can be interpreted as holding this sort qf view, especially, Vācaspati Misra[32] and Srī Harsa.[33] (In Western thought, we do have something vaguely like it in one interpretation of Kant: "Although we cannot coherently rule in the possibility of [some transcendental] non-spatial and non-temporal awareness, we cannot reasonably rule it out."[34]) Soteriological claims in both brahmanical and Buddhist schools take this form. But that is not what is at issue here.

The skepticism here is of another form. Let us call it "empirical skepticism." On this view, it cannot be determined that *this* current experience of a purported reality is coherent; it cannot be determined whether current experience at all grasps any part of a determinate reality. Transcendental and empirical skepticism can be held separately. In Indian thought, they are best known for being held in tandem by the Mdhayamika school.

There is a strategy by which the coherence of current experience can be questioned so as to set the stage for the possibility of some other, this time coherent, and transcendental experience. (One could, of course, carefully maintain a silence about the nature of such transcendence, on pain of incoherence).

But Vasubandhu cannot afford to adopt this strategy. The reason is simple: if he were trying to say that current experience is incoherent, then he would not have acknowledged the need to demonstrate the coherence of (non-external) dreaming experience. Challenged by the thought that dreaming experience may be incoherent, he would gratefully have accepted it, as a prelude to the acceptance of the incoherence of waking experience. But he does not do that. He accepts that experience must be understood in terms of regularities and intersubjective consistency. It is precisely because he assumes that there is a need to square his account of experience with the requirement of coherence that he sets out to argue that dreams (when properly analyzed) indeed do display such regularities. So, although he wishes to adhere to some form of transcendental skepticism as a way of establishing the Buddhist soteriological doctrine of *nirvāṇa*, he is not prepared to defend empirical skepticism; at least, his strategy of defending experience as coherent on his non-externalist account seems to commit him to the rejection of empirical skepticism.

If that is his strategy, then he cannot accept the conclusion that experience is always incoherent in its misrepresentation of externality. He cannot have it both ways: he must either give up an idealist translation of experience in which any appeal to the concept of externality is ruled out, or he must accept that experience is incoherent by virtue of being systematically illusory with regard to the representation of such externality.

If Vasubandhu's argument is correct, then we should be aware at all times that experience is illusory; we should have veridical experience that objects are not external even though they are presented as if they were. So, let us suppose he is correct. We might then reason that while he himself cannot make this point (for he would be committed to rejecting the very regularities he is concerned to defend on his idealist account), could not someone committed to empirical skepticism happily take over this argument?

They could not, at least not through the particular argument Vasubandhu has made. For the case would be made only if he were correct, but he is not.

He is not correct because he has attempted to explain experience without the concept of externality, and that, we have already seen in our analysis of the argument from dreams, he has not succeeded in doing. As Śaṅkara says of his idealist opponents, "they too, in the manner known to all people, become aware of the appearance of externality and only because of that are able to use the qualifier 'as if' in the term 'as if external'; yet they deny externality."

He compares this cryptically — perhaps unfairly — to the case of someone who asserts that Viṣṇumitra is the son of a woman who is not a mother. In other words, the denial of externality requires the experience of externality; but this leads to the contradiction of denying experience, like first seeing a man and then asserting that he is an impossible entity. So, if anyone is to argue for empirical skepticism, they cannot do that via an argument against externality. Also, if anyone is to argue for transcendental skepticism, they cannot do that via such an argument either. The assumption of externality in any account of experience is unavoidable.[35]

What could be the next possible step in the controversy? It is conceivable that one could come up with a defence of Vasubandhu. This could take one of two forms. On the one hand, some flaw could be spotted in the argument I have given, and a coherent account of experience given in which the concept of externality still played no part. Obviously, I am at the moment unable to anticipate what that flaw could be. On the other hand, it might be argued that I have misinterpreted Vasubandhu. That is, it might be argued that Vasubandhu does not reject the role of the concept of externality — provided it is understood in a suitably non-realist way — and that, consequently, he too can offer a coherent account of experience. Now, that would be a matter of exegesis and I am open to correction. But it should be noted that if such an account is found in Vasubandhu, it would be incumbent on the interpreter to say whether this is different from the Advaitic account and, if so, how.[36]

26. (1929), p. 551.

27. I use "experience" here to mean the sequence of cognitions; I am therefore using experience (*anubhava*) in the narrow sense of cognitions of objects, rather than in the broader sense of everything — love, despair, hope, glory — that constitute a life. In the narrow sense, a cognitive episode (*jñāna*) is interchangeable in usage with an experiential event (*pratyaya*).

28. Invariable correlation or concomitance may be defined thus: y is invariably correlated with x if and only if: always y occurs only if x occurs; contraposing, never if x does not occur does y occur. (I give the contraposed form because there is a debate in Indian thought on whether they are epistemically equivalent, an equivalence or absence thereof which matters much in Indian "logical" thought.)

29. We will remain neutral on the debate over whether this awareness of the concomitance is part of the content of the cognition in question or whether it is another individuated cognition.

30. Here we must note that the idealist is committed to the possibility of a statement such as *B* being true, though, of course, he must recognize that error occurs and must be explained. Therefore, he must explain how certain statements can be false by the standards of the *pramna* system. He does this through his idealist theory of self-generated cognition (*tmakhytivda*) (including the theory of how error occurs). We shall forbear to go into the plausibility of that theory and grant him the possibility of being able to account for error through the use of his favored criteria within the system of validation.

35. It should be noted here that the point I am making is not about how we possess the concept of externality or space and distance; it is that there is that in our experience of objects by virtue of which we indeed grasp that concept. What is it by virtue of which we do so? The answer is that the experience we have is constituted as experience of objects as external. This does not settle the issue of whether this concept is prior to or gained from experience; but it is clearly not separable from experience of objects. So even if it were to be argued, as by an empiricist, that we gain the idea of externality from experience, so long as it is also maintained, as by the idealist, that that idea is in some sense a misrepresentation of what there really is, the conclusion holds that idealism cannot render experience coherent.

J. L. SHAW

THE NYĀYA ON EXISTENCE, KNOWABILITY AND NAMEABILITY[*]

According to the Nyāya[1] existence (*astitva*), knowability (*jñeyatva*), and nameability (*abhidheyatva*) are considered as universal properties. All the categories of the Nyāya—Vaiśeṣika system including absence (*abhāva*) are said to have these three properties. In contemporary Western philosophy also, the problem of existence including the problem of identity occupies some logicians. The Nyāya view on such related topics might shed some light.

In this context it is to be noted that there is a difference of opinion as to the nature of existence among the Naiyāyikas. Śrīdhara,[2] a Naiyāyika, following Praśastapāda has explained the distinction between existence (*astitva*) as a universal property and existence (*sattā*) as a generic property (*jāti*). According to him existence as a universal property (from now on to be called 'existence$_2$') is common to all the six positive categories, viz., substance, quality, action, inherence relation, generic property and particularity. Existence as a generic property (from now on to be called 'existence$_1$'), which is very close to the Aristotelian conception of universal, is present only in substance, quality and action through the inherence relation. We can say that any particular individual object in any of the three categories has got existence$_1$. It is present in such individual objects (*vyakti*) through the inherence relation (*samavāya sambandha*) which is also called the inseparable relation.

Now it may be asked why existence$_1$ is present only in substance, quality and action. In order to avoid many logical puzzles it is claimed that inherence (*samavāya*), generic property (*jāti*) and the particularity (*viśeṣa*)

[of atoms and other eternal or simple objects] do not have existence$_1$. If existence$_1$ which is a generic property is itself present in a generic property, we have the puzzle of self-predication. If existence$_1$ is present as a generic property in each particularity, it ceases to be unique and particular. Inherence (*samavāya*) connects a generic property (*jāti*) with an individual. Now if existence$_1$ is present in inherence, it is to be related to inherence by another inherence and so on. Hence in order to avoid this regress it is claimed that existence$_1$ is not present in inherence.[3]

In addition to the above logical reason, there might be some psychologicalor epistemological reason behind the distinction between existence$_1$ and existence$_2$. We perceive substance, quality and action directly. But other entities are not perceived with the same directness. For the perception of a generic property (*jāti*) as a generic property, we require the apprehension of similarity (*anuvṛtti pratyaya*) between disparate objects. Ultimate differentiae or particularities of ultimate substances are not perceived in the way ordinary objects are perceived because the atomic constituents of an object are not perceived when we perceive an object. The epistemic directness present in the perception of substance, quality and action is not present when we perceive the inherence relation (*samavāya sambandha*). Both inherence (*samavāya*) and absence (*abhāva*) are relational entities. The relational nature of absence (*abhāva*) is more than that of inherence (*samavāya*). An absence has got twofold relational dependence. An absence is always an absence of something and it is present in some locus. The Nyāya does not admit bare absence. Let us consider the absence of a pot. Here all pots together form the counterpositive (*pratiyogī*) of the absence. According to the Nyāya, there cannot be an absence of an unreal object. The counterpositive (*pratiyogl*) of an absence must be an actual or perceived object. This condition rules out absences such as the absence of a hare's horn or the absence of the son of a barren woman. Usually a distinction is drawn in Western philosophy between the hare's horn and the son of a barren woman. It is claimed that the former is logically possible, though in fact it never occurs; while the latter is logically impossible. The Nyāya use of the term 'impossible' (*aprasiddha*) includes both empirical impossibility and logical impossibility. So an impossible (*aprasiddha*) object cannot be a counterpositive of an absence.

The Nyāya has accepted a relational abstract called counterpositiveness (*pratiyogitā*) which relates an absence to its counterpositive. The counterpositiveness is a type of self-linking relation (*svarūpa sambandha*). This relation is distinct from the relation of identity. It is neither reflexive nor symmetric.

Moreover, according to the Nyāya an absence of something is present in some locus. The locus of an absence is a real entity. The absence of a pot occurs in a set of loci. Now the question is how the absence of a pot is related to its locus. The relation of absence of a pot to its locus is also a self-linking relation (*svarūpa sambandha*). This shows the dependent nature of the absence of something or absence as an ontological category. Since it is not reducible to any positive entity, it is ontologically distinct from positive entities. In the sequel we shall discuss whether existence$_2$ is to be ascribed to absence also. Before taking up this problem let us discuss a few more attempts to draw the distinction between existence$_1$ and existence$_2$.

Śrīdhara,[4] a Naiyāyika, says that some philosophers have explicated existence$_1$ as *pramāṇagamyatā*, i.e. as that which is known by the accepted means of knowledge. Perception, inference, testimony and comparison are regarded as accepted means or instruments of knowledge. But if this definition is interpreted in the following way, then it involves circularity. The accepted means of knowledge has been explicated in terms of the objects having existence$_1$. Formally it can be represented in the following way:

> x has existence$_1$
> > *Df* x is known by an accepted means of knowledge.
> x is an accepted means of knowledge
> > *Df* The object of x (i.e. the objects known by the means of knowledge x) is something which has existence$_1$.

This representation clearly reveals the circular nature of the above definition. Moreover, this definition involves an infinite regress. If the means or instruments of knowledge have existence$_1$, we need another means of knowledge to know this means of knowledge, and so on. For these reasons most of the Naiyāyikas do not accept the above definition of existence$_1$.

Another attempt[5] has been made to explicate the existence$_1$ in terms of *pramāṇasambandhyayogya-vastusvarūpa*, i.e. the objects which can be established by accepted means of knowledge. This definition refers to the dispositional quality of the objects, while the former definition does not refer to any dispositional quality of the objects. By referring to the dispositional quality of the object, this definition overcomes the cognitive circularity. A circularity is to be called cognitive if, in order to know *X*, we have to know *Y*, and *vice versa*. But an ordinary circularity where this type of cognitive difficulty does not arise is a case where the terms are interdefinable. The second definition of existence$_1$ mentioned above avoids the first type of circularity, but not the second type. The upholders of this interpretation of existence$_1$ argue, finally, that there is no need to accept existence$_1$ as a generic property (*jāti*), as an independent category distinct from substance, quality and action.

Another related question has to be answered in this connection. The question is, why should we include only substance, quality and action in one group? The question demands an answer in terms of the principle of grouping. Śrīdhara suggests a specification of the principle of grouping. According to him, existence$_1$ is to be accepted in order to give an account of the commonness in the perception (*akākāra-pratīti*) of substance, quality and action. In other words, when we perceive substance, quality and action, we not only perceive them as distinct from each other, but also perceive them as existent. This commonness in the perception cannot be accounted for in terms of the nature of either substance or quality or action alone. It must be different from, but common to substance, quality and action. This commonness in the perception has been further explained in terms of a notion that is distinct from the notion of absence (cf. *abhāvabilakṣaṇa*).[6]

This argument of Śrīdhara may be considered as an epistemic argument for the acceptance of existence$_1$. It is a fact that substance, quality and action appear as unified under the notion of existence$_x$. That which serves as a principle of unity is to be called a generic property (*jāti*). Since this principle fulfils all the conditions for the acceptance of a generic property (*jāti*), it is to be regarded as a generic property (*jāti*). In addition to this argument (i.e., commonness perceived in substance, quality and action) we put forward another epistemological argument for grouping them under one heading. The way we come to know substance, quality and action is not the

same as the way we come to know other categories, viz., generic property (*jāti*) as a genuine property, particularity (*viśeṣa*), inherence (*samavāya*) and absence (*abhāva*).

Now let us consider existence$_2$ (*astitva*). According to Śrīdhara[7] existence$_2$ is the common characteristic of all the six positive categories. Existence$_2$ is the unifying principle of substance, quality, action, particularity, generic property and inherence. According to this view, therefore, to say that x has existence$_2$ is equivalent to saying that x is a positive entity. This view does not ascribe existence$_2$ to absence (*abhāva*), although some other Naiyāyikas including Udayana[8] ascribed existence$_2$ to absence (*abhāva*) also. Some arguments might be devised for ascribing existence$_2$ to absence also. First of all, from the ontological point of view, the absence of a pot does not hold the same position as the son of a barren woman. It is not as unreal as the son of a barren woman. But from this it does not follow that it is as real as a positive entity. It has got, for example, two-fold dependence on positive entities. The counterpositive of an absence must be a real object as opposed to an unreal object. Any expression of the form 'absence of x' where 'x' ranges over both positive and negative entities, is significant if the expression 'absence of y', where 'y' ranges over positive entities only, is significant. Hence in order to determine whether 'absence of absence of a' is significant, we have to determine whether 'absence of a' is significant. The latter expression would be significant if 'a' stands for a positive entity. In this way an absence is dependent on a positive entity. Moreover, an absence of x *usually* requires a positive locus. From these facts one might say that an absence shares some features common to positive entities. Since existence$_2$ is the common feature of all the positive entities, we can ascribe this feature to absence also, and by the term 'positive entity' we demarcate or distinguish the six categories from absence. Now we are landed with a three-fold ontological classification of entities:

1.   Substance, quality and action,
2.   Substance, quality, action, particularity, generic property and inherence,
3.   Substance, quality, action, particularity, generic property,

inherence and absence.

According to our positive thesis if we follow the line of argument followed by some Naiyāyikas who have made the distinction between existence$_1$ and existence$_2$, we should introduce existence$_3$ also. If in order to explain the commonness of substance, quality and action we have to postulate existence$_1$, then in order to explain the commonness of the six positive categories we should postulate existence$_2$ and in order to explain the commonness of all ontological categories including absence (*abhāva*) we should postulate existence$_3$. Now the question is how these different existences (i.e existence$_1$, existence$_2$ and existence$_3$) are related. By applying the following principle they can be ranked in a hierarchical order. The principle may be stated in the following way:

> Existence$_n$ is more basic than existence$_{n+1}$ if and only if the objects to which existence$_n$ is applicable are more basic than the objects to which existence$_{n+1}$ is applicable.

According to the Nyāya not only existence (*astitva*) (existence $_3$ in our reconstruction of the Nyāya view) but also knowability (*jñeyatva*) and name-ability (*abhidheyatva*) are properties of all objects including absences. To exist is to be knowable and nameable. It is claimed that if something has one of the three properties, it has the remaining two properties as well. According to Śrīdhara[9] 'nameability' (*abhidheyatva*) means the property of being communicable through a (linguistic) expression (cf. *abhidhāna-pratipādanayogya*). Every object has the property of being communicable through language. Udayana,[10] a Naiyāyika, also defines 'nameability' (*abhidheyatva*) as the property of being connected (or related) with a word or an expression (cf. *śabdena saṃgatilakṣaṇasambandha*). This amounts to saying that the objects have the property of being referred to by expressions. From these definitions of Śrīdhara and Udayana it follows that the word 'name' in this context means 'referring expression'. So the expression 'nameability' stands for the property of being referred to by a referring expression.

According to Udayana,[11] 'knowability' (*jñeyatva*) means the property of being known or cognised (cf. *jñapya-jñapakalakṣaṇasambandha*). This amounts to saying that an object can be an object of knowledge or cognition.

From our discussion of existence$_3$ (*astitva*), knowability (*jñeyatva*) and nameability (*abhidheyatva*), it is obvious that the latter two are relational properties of objects. In the case of knowability (*jñeyatva*) the relation is between object and knowledge or cognition and in the case of nameability (*abhidheyatva*), the relation is between an object and a name (an expression). But existence$_3$ (*astitva*) is not considered as a relational property. Secondly, 'knowability' and 'nameability' are dispositional terms, but not 'existence'. Hence the former two terms refer to dispositional properties, but not the latter.

Now let us discuss the question in what sense existence$_3$, knowability and nameability are to be regarded as properties of all objects. The Nyāya claims that they are imposed properties (*upādhis*). According to the Nyāya, properties other than qualities, actions, particularities, and absences are of two types. One type of property is called a generic property (*jāti*), which roughly corresponds to class-essence, and the other type of property is called an imposed property (*upādhi*). All the properties other than class-essences are to be included in the latter group. A generic property or class-essence (*jāti*) is ontologically distinct from the individuals and it is related to the individual objects through the inherence relation. But an imposed property (*upādhi*) is not ontologically distinct from the possessor of it. Moreover, it is not related to its possessor through the inherence relation, but through what is called a self-linking relation (*svarūpa sambandha*). The property of humanity or man-ness is considered to be a generic property (*jāti*), and it resides in all human beings through the inherence relation. But the unique property of an individual person is considered to be an imposed property. The unique 'personality' of a person (*tad-vyaḥtitva*) is not ontologically distinct from the person in question, and it is related to that person through a self-linking relation (*svarūpa sambandha*). Any property of a generic property is also an imposed property. If potness is a generic property (*jāti*), theil the uniqueness of potness is an imposed property which qualifies potness, and it is related to potness through a self-linking relation (*svarūpa sambandha*).

The Nyāya claims that existences₃ (*astitva*), knowability (*jñeyatva*) and nameability (*abhidheyatva*) are to be regarded as imposed properties of all objects. Since they are properties of all objects, they cannot themselves be generic properties (*jātis*). If they are treated as generic properties (*jātis*), they cannot be properties of generic properties (*jātis*), inherence (*samavāya*), particularities (*viśeṣas*) and absence (*abhāva*). In order thus to avoid many logical puzzles, imposed properties (*upādhis*) are not treated as generic properties (*jātis*).

Let us now discuss some of the objections which can be raised against the Nyāya view.

It may be said that the Nyāya analysis of these terms involves circularity.[12] If we use nameability as a criterion of existence, we have to postulate objects corresponding to each name or referring expression. Now the question is, what is the criterion of nameability? If we take a grammatical criterion of names, any referring expression would be a name. On a grammatical criterion referring expressions such as 'John', 'Pegasus', 'the author of Waverley', 'the sky-flower', 'the son of a barren woman' would be treated as names. Hence if we accept nameability as a criterion of existence and a grammatical criterion of names, we have to include objects such as Pegasus and a hare's horn in our ontology. This move is not acceptable to the Nyāya. If we accept existence also as the criterion of nameability, the definition of existence becomes circular, and the empty referring expressions would not be considered as names. But the Nyāya draws a distinction between an empty referring expression like 'Pegasus' on the one hand, and a non-empty referring expression like 'Socrates' on the other. According to the Nyāya if *x* exists, then *x* is nameable. But this does not imply that if *x* is nameable, then *x* exists, where '*x*' ranges over both empty and non-empty domains. This will be obvious once we explain the distinction between an empty referring expression and a non-empty referring expression as made by the Nyāya philosophers.

If the empty referring expressions are considered as meaningless, we cannot make statements like 'a hare's horn does not exist' or 'no existent thing is unnameable'. The Nyāya would say that these statements need logical analysis. In the ideal language of the Nyāya the phrase 'the absence of horn in a hare' would occur instead of the phrase 'the absence of a hare's horn'. The phrase 'the absence of a hare's horn' violates one of the rules of negation. According to the Nyāya, in the phrase 'the absence of *x*', '*x* must

refer to a real entity. Since this condition is not fulfilled, the phrase 'the absence of a hare's horn' would be non-significant. Now the question is whether the term 'a hare's horn' is meaningful. According to the Nyāya, if an expression represents (or expresses) a qualificative cognition (*savikalpa-jn~āna*), it is to be considered as meaningful and the cognition would be either true or false. The cognitive content expressed by the term 'a hare's horn' may be represented thus:

C(hare-contentness — horn-contentness).

The term 'hare-contentness' signifies a relational abstract resident in a hare. In other words, it signifies a hare's property of being related to cognition. The term 'horn-contentness', similarly, signifies a horn's property of being related to cognition. 'C' signifies the *condition* relation or the *qualificand-qualifier* relation. The hare-contentness is conditioned by horn-contentness. In every qualificative cognition (*savikalpa-jn~āna*) this *condition* relation is present. According to the Nyāya the ultimate constituents of the content of a cognition are real entities. In the above example the terms 'horn' and 'hare' refer to real entities and hence they are non-empty terms. If these terms themselves represent qualificative cognitions, then the ultimate constituents of these contents would not be a hare or a horn, but the constituents of the cognitive content expressed by the expression 'hare' or 'horn'. As a matter of fact, according to the Nyāya the word 'hare' or 'horn' expresses a qualificative cognition. The cognitive content expressed by the word 'hare' might be represented in the following way:

C(hare-individual-contentness — hare-ness-contentness).

The term 'hare-individual-contentness' signifies hare-individual's property of being related to cognition, and the term 'hare-ness-contentness' signifies hare-ness's property of being related to cognition. The term 'C' signifies the *condition* relation or the *qualificand-qualifier* relation. The question of truth or falsity arises with respect to a qualificative cognition which involves a distinction between qualificand and qualifier. In the case of a true cognition the complex contentness resides in the object which corresponds to the complex content of a cognition, but in the case of a false cognition the complex contentness does not reside in the complex object corresponding to

the complex content, because there is no such complex object. The complex contentness is determined by its constituent contentnesses. This type of contentness which is present in every qualificative cognition (*savikalpa-jn~āna*) may be called condition-contentness (cf. *nirūpya-nirūpakabhāvāpanna-viṣayatā*).[13]

In the case of a true cognition also this complex contentness which is a function of its constituent contentnesses is present. In addition to this contentness which is present in all qualificative cognitions, a true cognition has another complex contentness (*viśiṣṭāviṣayatā*) which resides in the complex object corresponding to the cognitive content. In other words, according to the Nyāya theory of meaning the atomic parts of a meaningful expression must be non-empty and a complex expression may be empty or non-empty. A complex expression would be meaningful if its atomic parts are non-empty and its meaning can be explained in terms of the cognitive content. The expression 'a hare's horn' expresses a complex cognitive content and its constituent terms, viz. 'hare' and 'horn', are non-empty. Hence it is to be considered as meaningful. Since there is no object corresponding to the complex cognitive content, i.e. C(hare-contentness — horn-contentness), the sentence which expresses the content is to be considered as false.

Now let us consider the question whether the term 'unnameable' is meaningful according to the Nyāya. If the term 'unnameable' is meaningless, the expression 'no existent thing is unnameable' would be meaningless. The term 'unnameable' means 'absence of nameability'. According to the Nyāya theory of absence (negation), an absence must be an absence of a real entity and the absence of it (i.e. the real entity) must be locatable in some locus which is a real entity. The complex 'absence of nameability' fulfils the first requirement, but not the second requirement. (It is to be noted that the term 'absence of a hare's horn' does not fulfil the first requirement.) Since the negation of a universal property is not locatable anywhere, the Nyāya would not consider the negation of a universal property as another property. In this respect the Nyāya does not accept what is called the significance criterion of negation in Western logic. According to this criterion, if a term is meaningful, its negation is also meaningful. The terms 'existence', 'nameability' and 'knowability' are meaningful, but their negations are not meaningful, because they violate one of the conditions for negation (*abhāva*).

The Nyāya rules for absence are to be treated as rules for making negative terms. If a negative term does not denote a negative property occurring in some locus, it cannot be a genuine (or significant) negative term. Since the absence of a universal property is not locatable in some (real) locus, it cannot be treated as a genuine property and hence the term denoting such a property cannot be treated as a significant expression. If the term 'unnameable' is nonsignificant, the sentences 'no existent thing is unnameable' and 'all unnameable things are non-existent' are also non-significant. But the sentence 'all existent things are nameable' is true. Hence one may say that, according to the Nyāya, the rules of obversion, contraposition and double negation are not universally valid rules.

Now let us discuss the question whether there are three universal properties corresponding to the terms 'existence', 'knowability' and 'nameability'. The Nyāya accepts only one class-essence or generic property (*jāti*) for a class of objects. Corresponding to the class-word 'man' there is the generic property *humanity*. Similarly, corresponding to each term signifying a species, there is a generic property (*jāti*). If different terms are used to express the generic property of a class, they do not express distinct generic properties. They name the same generic property. Now if this argument is used in the context of imposed properties (*upādhis*), then 'existence', 'knowability' and 'nameability' would name the same imposed property.[14] But obviously an imposed property is not a generic property. And the criterion of identity of a generic property is not the same as that of an imposed property. This is underlined in the Nyāya distinction between a *jāti* or generic property and an *upādhi* or imposed property.

One can, however, question whether the Nyāya has used redundant terms in designating the same imposed property by using three different terms. If there is no difference between these terms, the charge of redundancy might be put forward against the Nyāya. But it appears to us that the Nyāya has not used redundant terms in this context. By using three different terms the Nyāya is emphasising the mode of presentation of the universal feature of all objects. If the term 'meaning' is used for 'the mode of presentation', it might be said that these terms differ in meaning, although they may have the same reference. This difference in meaning can be shown in several ways. The terms 'knowability' and 'nameability' emphasize the relational mode of presentation of the objects. The term 'knowability' emphasizes the relation of objects to knowledge or cognition and the term 'nameability'

emphasizes the relation of objects to names or expressions. Moreover, 'knowability' and 'nameability' are dispositional terms. But the term 'existence' does not signify the relational mode of presentation of the objects. Moreover, it is not a dispositional term like 'knowability' or 'nameability'. Hence if we draw such a distinction of meanings (modes of presentation) of these terms, we can say that these three terms may have the same reference, but they differ in meaning. If two expressions have the same reference, but differ in meaning, one of them cannot be called 'redundant' in the usual sense of the term. Hence the charge of redundancy cannot be brought against the Nyāya.[15]

[14] In this context one might ask whether one can talk about the same imposed property if the terms which signify this property are empty. According to the Nyāya semantics the expressions which signify an unreal imposed property are empty terms. The terms which signify the same unreal imposed property would express the same cognitive content. Hence the synonymity of the terms signifying the same unreal imposed property is to be explained in terms of the identity of the

cognitive content. That is to say, these terms express the same cognitive content. For a more comprehensive discussion on the Nyāya concept of empty terms see Matilal (1971), pp. 123–145, and Shaw (1974), pp. 332–343.

[15] For some of the points mentioned in this paper, I am indebted to Professor B. K. Matilal. I am also indebted to Professor G. E. Hughes for many valuable suggestions. However, the faults are mine.

IS WHATEVER EXISTS KNOWABLE AND NAMEABLE?

Roy W. Perrett

School of History, Philosophy and Politics, Massey University, Palmerston North, New Zealand

Naiyāyikas are fond of a slogan, which often appears as a kind of motto in their texts:"Whatever exists is knowable and nameable" *(astitvaṃ jñeyatvam abhidheyatvam)*. What does this mean? Is it true? The first part of this essay offers a brief explication of this important Nyāya thesis; the second part argues that, given certain plausible assumptions, the thesis is demonstrably false.

I

"Whatever exists is knowable and nameable." This thesis seems to have been introduced into Nyāya-Vaiśeṣika by Praśastapāda with the following elusive statement:

> All six categories possess existence, nameability and knowability *(sāṇṇām api padārthānām astitvābhidheyatvajñeyatvāni)*.[1]

Subsequent Naiyāyikas take over and develop this thesis in various interesting ways, but my concern here is with its philosophical significance and plausibility, rather than its history.[2]

Nyāya understands this thesis to be fully convertible: not only are all existents knowable and nameable, but anything knowable or nameable exists. That is, not only is existence a universal property, but so, too, are knowability and nameability. Prima facie the thesis is especially implausible when we consider the case of nameability. First, it seems we can readily name entities that do not exist (e.g., Pegasus, rabbit horns).

Second, we can apparently at least imagine that there may be unnameable entities. But in doing so we name these entities"unnameable." Thus, since they are so nameable, they must exist, but since they are both nameable and unnameable they also cannot exist—a contradiction.

To these objections Nyāya responds by distinguishing between empty referring expressions and non-empty referring expressions. Briefly, the Nyāya strategy is to treat empty referring terms as complex and their simple parts as standing for real elements. Sentences like"The rabbit horn does not exist," which apparently refer to nonexistent entities, are translated into sentences like"There is no relation between the rabbit and a horn," which refer only to entities (including relations) that are reals according to Nyāya metaphysics.[3]"Nameable" means, then, nameable in the ideal language of the Nyāya system wherein all genuine names refer to the reals admitted by Nyāya ontology. No such real is either unnameable or unknowable.

What about"knowable"? If every existent is knowable, by whom is it knowable? One possibility is that all existents are knowable by an omniscient God. From a fairly early date in the development of the school, Nyāya-Vaiśeṣika affirmed the existence of an omniscient *Īśvara*, who composed the Vedas, so it is not surprising that Naiyāya is explicitly committed to affirming that all truths are knowable by God. Indeed, we find that Viśvanātha's *Siddhāntamuktāvalī* glosses"knowability" thus:

> Knowableness *[jñeyatva]* is being an object of knowledge, and it is present in everything, because the state of being an object of God's knowledge is universally present.[4]

It is interesting to note, however, that older Naiyāyikas like Praśastapśda and Udayana make no mention of God in relation to the thesis that all existents are knowable. Clearly this is not because they are skeptical about God's existence: Praśastapāda is often identified with the Praśastamati whose proof of God's existence is mentioned by Śāntarakṣita, and Udayana's *Nyāyakusumāñjali* is the undisputed *locus classicus* for the usual Nyāya theistic proofs.[5] I suggest instead that this omission is because the scope of the knowability thesis is not supposed to be restricted just to knowability by God, but is supposed also to include knowability by humans. Recall the promise of the very first verse of Praśastapāda's *Padārthadharmasaṃgraha* (itself an allusion to *Vaiśeṣika Sūtra* I.i.4):

> A knowledge of the true nature of the six categories …—through their similarities and dissimilarities,—is the means of accomplishing the highest bliss *[niḥśreyasa = mokṣa]*.[6]

Nyāya-Vaiśeṣika is indeed theistic, but it also exhibits a very strong belief in the possibility of liberation through human effort, particularly intellectual effort. If knowledge of the categories *(padārtha)* is supposed to be the means to such liberation, then Nyāya is committed to the possibility of such knowledge by humans.

At least one modern Indian commentator on Nyāya-Vaiśeṣika, Sadananda Bhaduri, is approvingly explicit about this:

> [B]y insisting on knowability as a test of reality and thus suggesting that the two concepts are coextensive, the Vaisesika philosopher makes it perfectly clear that he is not prepared to give quarter to any form of agnosticism. Reality, according to him, is capable of being fully known by means of the resources given to the human mind.[7]

In other words, though Nyāya does indeed believe all existents are knowable by an omniscient God, it is also strongly committed to the thesis that all existents are knowable *by humans*. Given Nyāya's commitment to both the nameability thesis and a correspondence theory of truth, we can without any undue violence to their intentions represent Naiyāyikas as affirming the following two theses:

Divine Knowability: All truths are knowable by an omniscient God.
Human Knowability: All truths are knowable by humans.

This translation of the Nyāya knowability thesis into the possibility of propositional knowledge of truths may be controversial. After all, it might be objected, Nyāya talks of cognitions or awarenesses *(jñāna)*, not propositions. Thus it is more accurate to represent the Nyāya claim in terms of the *de re* knowability of all entities, rather than the *de dicto* knowability of all truths.[8] Contrary to this objection, however, I believe that it is indeed often justifiable to treat cognitions in Nyāya as if they were propositions or sets of interlocking propositions, and to state the knowability thesis in terms of propositional knowledge.

Of course, it is true that *jñāna* are not, strictly speaking, propositions, but episodic cognitions. They do, though, have a propositional structure, and for many purposes it is convenient to treat them as if they were propositions. Moreover, the Nyāya knowability thesis is not just the weak thesis that all entities are cognizable, but the strong thesis that all entities are *veridically* cognizable, that is, knowable in something like the Western sense of that term. (This is particularly evident in Navya-Nyāya where *prameyatva* sometimes replaces *jñeyatva* in the slogan.) Furthermore, Gahgesa insists both that only determinate cognitions *(savikalpaka jñāna)* can be veridical, and that all determinate cognitions are verbalizable. Hence it seems that in Navya-Nyāya all genuine knowledge is effectively propositional, all knowledge is fundamentally knowledge-that.

True, Nyāya also admits the existence of indeterminate cognitions *(nirvikalpaka jñāna)*, which are nonverbalizable. These are not apperceptible; they are known only by inference as a causal presupposition of determinate awarenesses. It is tempting to suppose that these can be understood in terms of *de re* knowability. But, at least for Navya-Nyāya, this would be a mistake. First, Gaṅgeśa insists that such indeterminate cognitions can be neither veridical nor non-veridical, and hence not knowledge. Second, Gaṅgeśa also holds that individuals are cognized only determinately. In an indeterminate cognition we are not directly aware of a bare particular. Rather we cognize only a qualifier, and a relation, and this cognition causes our determinate cognition of an individual as a qualificandum related to a qualifier.[9]

Finally, given these Navya-Nyāya doctrines, we might well be skeptical about the very applicability of the *de re/de dicto* distinction to Nyāya knowability. One familiar way of drawing this distinction (as found, for instance, in Montague grammar) is to say that in *de re* belief we assert a relation between a believer and another individual (i.e., between individuals), whereas in *de dicto* belief we assert a relation between an individual and a set of properties. But, according to Navya-Nyāya, in indeterminate cognition we have a relation only between an individual and a qualifier; so it is not *de re*. And in determinate cognition we have a relation between an individual and another individual only as a qualificandum related to a qualifier, where the qualificandum is not itself just a set of properties; so it is not *de dicto*. (Similar considerations count also against the claim that the Nyāya knowability thesis is about"knowledge

by acquaintance," since this latter kind of knowledge is supposed to involve a direct relation between a knower and an entity, unmediated by any description.)

To return, then, to the difference between divine and human knowability, divine knowability is of course not very controversial if understood in a hypothetical sense; that is, if there is an omniscient God, then presumably all truths are knowable by him. This is arguably just an implication of the concept of omniscience. Indeed, an even stronger thesis seems plausible: if there is an omniscient God, then presumably all truths are known by him. For God, then, knowability collapses into knownness.

For humans, however, things are rather different. First, human knowability does not so obviously collapse into human knownness: whatever the plausibility of the claim that all truths are humanly knowable, it is wildly implausible to suppose that all truths are humanly known. Second, the claim that all truths are knowable by humans is, at the very least, a highly controversial one. True, there are distinguished Western philosophers who also affirm it. Charles Sanders Peirce, for instance, rejected the notion of "incognizables," insisting that only what is knowable by us humans is real: "In short, *cognizability* (in its widest sense) and *being* are not merely metaphysically the same, but are synonymous terms"[10] And Michael Dummett affirms that there is only a fact of the matter when a claim to that effect is such that we humans "could in a finite time bring ourselves into a position in which we were justified either in asserting or denying [it]."[11] But in Western philosophy such views are most typically associated with some form of anti real ism (explicitly so in the case of Dummett). Nyāya-Vaiśeṣika, however, is usually classified as a robust realism. Is realism even *compatible with* the thesis of human knowability?

Thomas Nagel has argued that it is not, but he also stresses how much turns on how we understand the term "realism." One obvious possibility is to construe realism as the affirmation of the thesis that reality is independent of cognizers, that is, that the world does not depend upon cognizers for its existence. Idealism is then defined in terms of the denial of this thesis. But Nagel wants to capture what he takes to be a more insidious form of idealism:

> In simple terms [realism] is the view that the world is independent of our minds, but the problem is to explain this claim in a nontrivial way which

cannot be easily admitted by everyone.… The idealism to which this is opposed holds that what there is is what we can think about or conceive of, or what we or our descendants could come to think about or conceive of.[12]

In other words, according to Nagel, what idealism affirms and realism denies is that the contents of the universe are limited by our capacity for thought. On this understanding of"idealism," then, idealism makes conceivability a universal property. But, then, since nameability and knowability entail conceivability, Nyāya is also a form of idealism. This fits ill with the usual classification of Nyāya as a robust realism vigorously opposed to Buddhist idealism and phenomenalism.

It may be helpful here to remember that realism is traditionally acknowledged to have two distinct components—one metaphysical and one epistemological. The metaphysical component is the claim that there exists a"real world," that is, an objective, mind-independent, physical reality. The epistemological component is the claim that we can know something about this mind-independent realm. Obviously the epistemological claim presupposes the metaphysical claim. Now the Nyāya view is clearly realist in the epistemological sense: indeed the Nyāya knowability thesis might be seen as an extreme version of epistemological realism. But are Naiyāyikas truly realists in the metaphysical sense, given their denial of the unknowable and unnameable?

Traditional Western philosophical realism has insisted on preserving a gap between ontology and epistemology in order to allow for the possibility that there may very well be truths about reality that humans will never know. To suppose otherwise, it is feared, would be to collapse the distinction between fact and cognition. From this traditional perspective it is tempting to conclude that the Nyāya knowability thesis is a form of metaphysical antireal ism. But arguably there are actually a number of varieties of metaphysical realism, distinguished according to how we draw the fact/cognition distinction.

Nicholas Rescher has usefully suggested that one way we can attenuate the fact/ cognition distinction is by liberalizing cognizers. He asks us to consider the following series. *For something to be a fact it is necessary that it be knowable by,*

(1) *Oneself.*

(2) *One's contemporary (human) fellow inquirers.*
(3) *Us humans (at large and in the long run).*
(4) *Some actual species of intelligent creatures.*
(5) *Some physically realisable (though not necessarily actual) type of intelligent being— creatures conceivably endowed with cognitive resources far beyond our feeble human powers.*
(6) *An omniscient being (i.e. God).*[13]

Rescher suggests that no "*sensible* idealist maintains a position as strong as (1)," and no "*sensible* realist denies a position as weak as (6)."[14] What is in dispute is where to draw the line that marks the realism/idealism boundary. This suggestion would mean that the Nyāya commitment to divine knowability (equivalent to (6) above) is comfortably compatible with a "sensible" realism. What is more problematic is whether the Nyāya commitment to human knowability (equivalent to (3) above) is to be counted as realist. Rescher's own view is that (5) marks the idealist line: a realist is one who draws the line short of that. Nagel refuses to count advocates of (3) as genuine realists, though Rescher counts them as "*homo mensura* realists" who confine the real to what humans can, in principle, know. Thus, as Nagel counts realists, Nyāya is not among their number, but as Rescher (more permissively) counts realists, Nyāya is among their number.

Nothing substantive, of course, turns on which terminology we use to classify the Nyāya position, though it is useful to see why there might be some dispute as to whether Nyāya is properly described as realism. The substantive issue is whether (3) above is true: is it really the case that everything is humanly knowable, as Nyāya apparently supposes? I want to argue that, given certain plausible assumptions, the human knowability thesis is demonstrably false.

II

Let us begin by restating the relevant Nyāya commitments more formally. Consider first the following pair of theses:

Human Knowability: All truths are knowable by humans.

Human Knownness: All truths are known by humans.

Although Naiyāyikas are committed to the former thesis, they are far too sensible to be committed to the latter. Not only is human knownness not directly entailed by human knowability, but the thesis of human knownness is blatantly false. Instead Nyāya *affirms* human knowability and *denies* human knownness. Let us symbolize these two Nyāya theses thus:

T_1: $p \rightarrow \Diamond Kp$.
T_2: $\sim(p \rightarrow Kp)$.

But, given a couple of plausible assumptions, we now can show that the conjunction of these two theses is inconsistent, utilizing a proof first published by Frederic Fitch.[15]

The extra assumptions we need are two widely accepted principles of epistemic logic:

A_1: $Kp \rightarrow p$.
A_2: $K(p \& q) \rightarrow Kp \& Kq$.

The first assumption tells us that what is known is true. The second assumption tells us knowledge distributes over conjunction: if I know p and q, then I know p and I know q.

Consider again thesis T_2 (the negation of human knownness). If this thesis is true, then there is some truth p which is not humanly known. Symbolize this claim as "$p \& \sim Kp$" (which is, of course, just logically equivalent to "$\sim(p \rightarrow Kp)$"—i.e., T_2).

Now the *reductio* proof of the inconsistency of the premise set $\{T_1, T_2, A_1, A_2\}$ goes through as follows:

(1) $p \& \sim Kp$ From T_2

(2) $\Diamond K(p \& \sim Kp)$ From (1) & T_1

(3) $\Diamond (Kp \& K\sim Kp)$ From (2) & A_2

(4) $\Diamond$ (Kp & ~Kp)   From (3) & A$_1$

Since (4) is a contradiction, we know that at least one of our original assumptions is false. A$_1$ and A$_2$ are both uncontroversial principles of epistemic logic. T$_2$ is obviously true. Hence the conclusion to be drawn is that T$_1$ is false; that is, it is not the case that all truths are knowable by humans.

It may be objected that the argument above utilizes anachronistic logical assumptions. True, Nyāya explicitly embraces the principle of noncontradiction.[16] And perhaps the two principles of epistemic logic are plausible enough. But the proof uses the modal notion of logical possibility, even though Indian logic recognizes no such notion of modality.

It is unclear that this objection is at all successful. First, even if the classical Indian philosophers did not have our modern notion of logical possibility, it is still an open question how far their views can be reconstructed in terms of such a modality. (Indian logic does, for instance, recognize linguistic truths that may be interpreted as analytic: for example,"An x which is F is F.") Second, classical Nyāya does at least seem to be committed to something like Diodorean modalities, that is, an understanding of possibility and necessity such that to say that something is possible is to say that it obtains at some time or other, and to say that it is necessary is to say that it obtains at every time.[17] This is arguably implicit in the standard formulation in Indian logic of the"necessary" relation of pervasion *(vyāpti)*, which requires that for fire to pervade smoke it is never the case that in all those loci where smoke is present fire is absent.

Suppose, then, that we reconstrue the human knowability thesis not in terms of the logical possibility of such knowledge, but rather in terms of the Diodorean possibility of such knowledge; that is, to say that all truths are humanly knowable is just to say that all truths are humanly *known at some time*. Symbolize such a Diodorean possibility operator as"S," read as"At some time," and replace T$_1$ by:

T$_3$: p $\rightarrow$ SKp.

Obviously the first proof will now not go through exactly as before. But we can still prove the inconsistency of the new premise set $\{T_2, T_3, A_1, A_2\}$ as follows:

(5) p & ~Kp   From T_2

(6) SK(p & ~Kp)   From (5) & T_3

(7) S(Kp & K~Kp)   From (6) & A_2

(8) S(Kp & ~Kp)   From (7) & A_1

But (8) is also a contradiction. So once again at least one of our original assumptions is false, and it seems that this time T_3 is the most likely candidate. In other words, it is not even the case that at some time or other all truths are known by humans.

It seems, then, that the human knowability thesis is demonstrably false. Contrary to the familiar Nyāya slogan, it is not the case that whatever exists is knowable and nameable.

III

Is there any way out for Nyāya? There are at least two possibilities that merit further investigation. The first involves a challenge to the validity of my arguments against the knowability thesis; the second involves a challenge to my interpretation of the Nyāya knowability thesis. Let us take them in turn.

Timothy Williamson has pointed out that the Fitch-style proofs fail if we assume an intuitionist logic that denies the law of double negation, that is, the equivalence of ~~p and p.[18] Intuitionists admit that p implies ~~p, but not that ~~p implies p. They avoid an infinite series, however, by admitting the equivalence of ~p and ~~~p. Now the first proof above requires that (T_2) entails (1), and the second proof requires that (T_2) entails (5). But in intuitionist logic (T_2) only entails the double negation ~~(p & ~Kp), and negation elimination is problematic.

Of course, even if it is true that the Fitch proofs are invalid given intuitionist principles, this alone still gives us no motivation to adopt

intuitionism unless we are already independently convinced of the truth of the thesis of human knowability. Since this thesis is not itself obviously true, invoking intuitionism just to save it would seem unsatisfactorily ad hoc. However, if instead it was true that Nyāya had good independent reasons for denying the law of double negation, then there would be no problem with thus blocking the two arguments above.

An obvious difficulty with such a strategy is that Old Nyāya is usually thought to have *affirmed* the law of double negation: in Udayana's words,"The negation of the negation of *x* is identical with *x*."[19] Moreover, at least the more traditional wing of Navya-Nyāya, from Gaṅgeśa on, follows suit. The radical Navya-Naiyāyika Raghunātha Śiromaṇi, however, famously holds otherwise.[20] According to Raghunātha, the absence of an absence of *x* is not *x*, but a new category. He then avoids a regress by holding that a triple absence (absence of absence of absence of *x*) is essentially identical with the first absence. Daniel Ingalls has noted the apparent parallel here with the intuitionists' view that ~~p does not imply p, though ~~~p does imply ~p.[21] But is the parallel significant enough to provide any support for a Nyāya-style intuitionism that would block the Fitch proofs and save the knowability thesis?

The Navya-Nyāya understanding of negation is a complex issue, which I forbear from attempting to discuss in any detail here.[22] Very briefly, then, Navya-Nyāya distinguishes between two kinds of negation: absence *(atyantābhāva)* and difference *(anyonyābhāva)*.[23] Sentential negation is usually avoided in favor of something closer to (though not quite identical with) term negation. More precisely, according to Nyāya, what is negated is the second term of a dyadic relation *as the second term of that relation*. We get an *absence* when it is a negation of occurrence or location, and a *difference* when it is a negation of identity.

When a negation negates occurrence or location, it is construed as ascribing the absence of a property to that locus. The statement"The pot is not blue," for example, is analyzed as"The pot has an absence of blue-color." When a statement negates an identity between, say, a table and a cup, then it is analyzed as"A table is different from a cup," which in turn is analyzed as"A table lacks cupness." In other words, there is an extensional equivalence between"difference from a cup" and"absence of cupness" since both these properties are locatable in the very same set of loci.

Combining these two kinds of negation gives us different versions of double negation, and Navya-Naiyāyikas broadly agree on the status of most of them.[24] The controversial one that concerns us here, however, is the combination of two absences, namely the question of whether the absence of the absence of *x* is identical with *x*. Most Navya-Naiyāyikas affirm this identity, arguing as follows. Whenever we perceive the presence of an object (say, a pot) we do not perceive the absence of a pot in the same locus, and vice versa. Hence we must admit that there is the absence of the absence of a pot there, for the class of loci of the pot is identical with the class of loci of the absence of the absence of the pot. Symbolizing absence *(atyantābhāva)* by "~," we can state the majority Navya-Nyāya opinion thus: $\sim\sim x = x$.

Raghunātha dissents from this orthodoxy. He argues that the notion of negation conveyed by $\sim\sim x$ can never be conveyed by *x*. All absences share a common property: *the property of being an absence (abhāvatva)*. It is in terms of this unanalyzable imposed property of all absences that an absence is to be distinguished from a positive entity. Hence an absence of an absence of *x* cannot be the same as *x* if *x* is a positive entity. In other words, Raghunātha denies double negation in such cases and affirms: $\sim\sim x \neq x$. However, to block an infinite regress of absences he still affirms double negation in the case of a triple absence, that is, $\sim\sim\sim x = \sim x$. This is the Navya-Nyāya thesis that apparently parallels the intuitionist view that $\sim\sim p$ does not imply p though $\sim\sim\sim p$ does imply $\sim p$.

This difference of opinion between Raghunātha and fellow Navya-Naiyāyikas is an interesting and real one, but the contrast between the two camps can easily be overdrawn. Raghunātha is stressing a cognitive, difference between two modes of presentation rather than a difference in referent. That is, in the case of the presentation of the property *x* by "*x*," the *x* is presented under the mode of *x*-ness; in the case of the presentation by "$\sim\sim x$," the same *x* is presented under the mode of being $\sim\sim x$. However, both "*x*" and "$\sim\sim x$" refer to the same object, though under different modes of presentation. There is an *extensional* identity between the presence and absence ranges of the property *x*, but *intensionally x* and the absence of the absence of *x* are distinguishable.

What do we learn from this brief excursus into Navya-Nyāya? First, that the Navya-Nyāya denial of double negation that apparently parallels intuitionism is very much a minority view within Nyāya, associated

primarily with Raghunātha.[25] It cannot be properly represented as *the* Nyāya view. Second, once we contextualize the Navya-Nyāya thesis that apparently parallels the intuitionist denial of double negation, we see that the surface similarity does not go very deep. In other words, the very special sense in which Raghunātha denies double negation provides no support for the hope of a genuinely Nyāya-style intuitionism that would block the Fitch proofs and save the knowability thesis. I reaffirm, then, my original conclusion: given certain plausible assumptions, the human knowability thesis is demonstrably false. Contrary to the familiar Nyāya slogan, it is not the case that whatever exists is knowable and nameable.

IV

There is, however, a second possibility still to consider: namely, the proposal that even if the human knowability thesis as *I have construed it* is demonstrably false, Nyāya is really only committed to a much weaker thesis. The suggestion here is that the Nyāya version of the human knowability thesis has to be understood in terms of the Nyāya theory of *sāmānyalakṣaṇa-sannikarṣa*, that is, the Nyāya claim that there is a kind of"extraordinary" *(alaukika)* perception of a universal characterizing all members of a class, one of whose members is presented.[26] Naiyāyikas posit such extraordinary perception in order to explain how we can know the truth of those universal judgments (like"All smoky things are fiery") that underpin all inductive inferences. Viśvanātha presents the Nyāya position in his *Siddhāntamuktāvalī* thus:

> [W]here smoke or the like is connected with the [sense] organ, and the knowledge that it is smoke has arisen, with smoke as its substantive, in that knowledge smokehood is a feature. And through that smokehood as the connection, there arises the knowledge"cases of smoke" comprising all smoke.[27]

In other words, when we perceive individual smokes and fires we also perceive the universals *smokeness* and *fireness* inhering in them. Through this sense contact with smokeness and fireness, which are generic properties equally shared by all cases of smoke and fire, we can in turn (nonsensuously) perceive all cases of smoke and of fire. Thus, the universal

concomitance of smoke and fire is established through an "extraordinary" perception of the whole class of smoke-possessing things as related to fire. To the objection that this alleged kind of perception would entail omniscience the reply is that, though we can perceive all objects of knowledge comprehended under a generic character, they are not thereby known in detail and we cannot perceive their mutual differences.

Applying this to the human knowability thesis, then, it is possible to argue that Nyāya does not really claim that humans can *fully* know each and every thing. However, humans can know everything in a *generic* way if they cognize existence in an object. Thus, if we understand the Nyāya version of the human knowability thesis against the background of their *sāmānyalakṣaṇa-sannikarṣa* theory, there need be no contradiction in asserting that something is both known and not known: it is known in a generic way, but not in a fully specific way. In other words, the object is known generically as an entity or *padārtha*, but it is not known specifically as what it is as distinct from other objects. Similarly, consider again the distribution rule for knowledge:

A_2: $K(p \& q) \rightarrow Kp \& Kq$.

This may not hold good with respect to *sāmānyalakṣaṇa-sannikarṣa* if "Kp & Kq" implies the ability to discriminate p from q.

This interpretive proposal suggests that we need to distinguish two senses of "knowledge": generic knowledge and fully specific knowledge. Call these, respectively, *weak knowledge* and *strong knowledge*. Obviously the possibility of these two kinds of knowledge also implies the possibility of four corresponding kinds of human knowability or knownness. This enables us to distinguish the following four theses for consideration:

Strong Human Knowability: Whatever exists is strongly knowable by humans.
Weak Human Knowability: Whatever exists is weakly knowable by humans.
Strong Human Knownness: Whatever exists is strongly known by humans.
Weak Human Knownness: Whatever exists is weakly known by humans.

With these distinctions in mind, we can now restate the Nyāya position according to the interpretive proposal before us. With respect to

knowability: it is now claimed that Nyāya *does* affirm weak human knowability, but does *not* affirm strong human knowability. With respect to knownness: it is now claimed that Nyāya *denies* strong human knownness, but affirms weak human knownness (since weakly knowing any existent means we know generically all existents).

In reply to all this I want to make several points. First, the Nyāya knowability thesis thus interpreted is certainly a much less exciting and challenging thesis than the one that many commentators have taken Nyāya to be affirming. (Recall the passage from Sadananda Bhaduri that I quoted earlier, expressing his enthusiasm for what he took to be Nyāya-Vaisesika's refusal"to give quarter to any form of agnosticism" with its affirmation of the claim that reality is"capable of being fully known by means of the resources given to the human mind" [my emphasis].)

Second, it is hard to see how such weak knowability of the categories could guarantee the possibility of the (presumably) strong knowledge of the categories that Prasastapāda promises is the means to liberation. For since weakly knowing any existent means we know generically all existents, all knowers already have weak knowledge of the categories—apparently without thereby being any closer to liberation. So it must be strong knowledge of the *padārthas* that is required for liberation. But whereas the truth of the strong knowability thesis would imply the availability to humans of the means of liberation, the truth of weak knowability can offer no such comfort to the unliberated—which was presumably at least part of the motivation for the Nyāya knowability thesis in the first place.

Third, the proposal explicitly appeals to the *sāmānyalakṣaṇa-sannikarṣa* theory. But there is considerable controversy among Naiyāyikas as to the acceptability of that theory. The very earliest Nyāya texts do not even mention this kind of extraordinary perception, though the theory is mentioned positively in various Old Nyāya texts, notably the *Nyāyamañjari* of Jayanta Bhatta. It is Gaṅgeśa, however, who is usually credited with the most explicit development of the distinction between ordinary and extraordinary perception, and some of his enormous personal prestige correspondingly attaches to the theory. But there are also some very distinguished Naiyāyika dissenters: within Old Nyāya, for instance, Vācaspati Misra rejected the *sāmānyalakṣaṇa-sannikarṣa* theory; and within Navya-Nyāya, so, too, did both Maṇikaṇṭha Miśra and Raghunātha Śiromaṇi.[28] The weak human knowability thesis cannot, then, pretend to be

an interpretation of the traditional Nyāya doctrine of knowability that would be acceptable to *all* Naiyāyikas.

Finally, perhaps it is true that the thesis of weak human knowability is not vulnerable to the Fitch proofs in the way that strong human knowability is. But the thesis does require a commitment to the controversial *sāmānyalakṣaṇa-sannikarṣa* theory, and this theory is not universally accepted by Naiyāyikas precisely because it seems to some of them just as philosophically implausible as it does to, for instance, their Advaitin opponents (not to mention most modern Western philosophers). When we perceive a particular pot are we really aware not only of the presence of the universal potness in it, but also (generically) of the class of *all* pots? It is by no means clear that positing this kind of extraordinary perception is the only way we can justify universal judgments, and in the absence of any other supporting argument the theory seems to many to be just plain implausible.

Thus this second possible way out for Nyāya also seems to fail. Understanding the traditional Nyāya knowability thesis as merely being weak human knowability both gives us a version that is too weak to do the work the doctrine was originally supposed to do and commits Nyāya to the existence of a type of extraordinary perception unacceptable to many within the Nyāya camp (and to even more outside it). True, weak human knowability may not be demonstrably false in quite the same way that strong human knowability is. However, the philosophical costs to the Naiyāyika of accepting it in place of strong knowability seem prohibitive.

Naiyāyikas face, then, something of a dilemma—or, as it is called in Indian logic, a "double noose" *(ubhayataḥpāśā)*. On the one hand, if they hold that whatever exists is strongly knowable, then (given certain plausible assumptions) their thesis is demonstrably false. On the other hand, if they hold that whatever exists is only weakly knowable, then they are committed to a theory that is both implausible and too weak for their original purposes. Either way, the traditional Nyāya doctrine that whatever exists is knowable and nameable must be judged rationally unacceptable.

Notes

For assistance, both philosophical and bibliographical, I am grateful to Graham Oddie, Jay Shaw, Mark Siderits, and the late Richard Sylvan (né Routley).

22 – Good discussions of this topic are to be found in Bimal Krishna Matilal, *The Navya-Nyāya Doctrine of Negation* (Cambridge: Harvard University Press, 1968), and J. L. Shaw,"The Nyāya on Cognition and Negation," *Journal of Indian Philosophy* 8 (1980): 279–302.

23 – Strictly speaking, Navya-Nyāya recognizes two broad types of negation: what Ingalls calls"mutual absences" (*anyonyābhāva* ="differences") and"relational absences" *(saṃsargābhāva)* (Ingalls, *Materials for the Study of Navya-Nyāya Logic*, p. 54). The latter type is then divided into three subtypes:"prior absences" *(prāg-abhāva)*,"posterior absences" *(dhvaṃsābhāva)*, and"constant absences" *(atyantābhāva)*. Since it is only the third of these three subtypes that concerns us here, I shall reserve the term"absence" for it alone.

24 – For more on the details of double negation in Navya-Nyāya see: Matilal, *Logic, Language and Reality*, chap. 2.6, and J. L. Shaw,"The Nyāya on Double Negation," *Notre Dame Journal of Formal Logic* 29 (1988): 139–154.

25 – Indeed, elsewhere in his writings Raghunātha himself takes the orthodox line that an absolute absence of an absolute absence of *x* is the same thing as *x*: see Karl H. Potter and Sibajiban Bhattacharyya, eds., *Indian Philosophical Analysis: Nyāya-Vaiśeṣika from Gaṅgeśa to Raghunātha Śiromaṇi* (Princeton: Princeton University Press, 1992), p. 47.

On Knowing by Being Told

Arindam Chakrabarti

Visiting Professor in the Department of Philosophy at the University of Washington

I

   Words are sometimes said to clothe our thoughts and beliefs. But, like some clothes, they usually reveal more than they conceal, often imposing shapes on our ideas which they might have lacked in their naked state. Beliefs put on the dress of language not only when they are exhibited but also when they travel from one person to another. Perhaps this whole sartorial imagery is wrongheaded. The very notion of beliefs or awareness episodes in their prelinguistic nudity may be a myth.

   However, while enough attention has been paid by recent philosophy to the phenomenon of expressing or displaying our thoughts, beliefs, or pieces of knowledge through our utterances, the major role of language in instilling information, in causing people to have true thoughts, and in generating knowledge has remained relatively neglected. Too busy with explaining *exhibition*, we seem to have forgotten about the *transmission* of knowledge through the medium of speech. Yet, as has been realized and elaborately articulated by Indian philosophers well over a thousand years ago, true utterances in a certain language are not only *caused by* pieces of knowledge acquired by the sincere and competent speaker but can themselves, in their turn, *cause* genuine knowledge in the unsuspecting audience that is trained in that language. Reading books or newspapers, listening to experts' lectures or radio reports, or checking with parents or eyewitnesses, we come by such important pieces of knowledge as the knowledge that each cell in my body contains twenty-three pairs of chromosomes, that the forest fire in Yellowstone National Park is spreading, or that I was born in September. Some of these pieces of information could

have been obtained by some of us *perceptually* or *inferentially* but all of them may actually be learned from verbal testimony. As H. H. Price pointed out, we not only have to take on trust such facts as how old each of us is, but even our knowledge of what day or date or year it is today is based on the evidence of testimony. Due to the increasing sophistication of the specialized branches of science and technology, we have to swallow more and more information from reliable say-so rather than try to obtain firsthand inferential or directly perceptual knowledge of most facts about the world or know-how about machines. Yet, even now the proposal to count testimony as an independent avenue of knowledge on a par with but not reducible to perception, inference, or memory seems to smack of dogmatism or gullibility.

Until recently, it counted as a standard complaint against some classical Indian theories of knowledge that they recognize "Report of the Reliable" as an accredited source of or evidence for knowledge. After the great 'linguistic turn' took place in the West, comparative philosophers, who used to feel apologetic about the otherwise hardheaded Nyāya philosophy's concern with word-generated knowledge, started defensively to discover echoes and anticipations of contemporary issues in the elaborate ancient and medieval discussions by Indian philosophers on themes like the meanings of words, sentences, quantifiers, pronouns, proper names, negatives, imperatives, and so on. The sheer opulence of dialectical materials and well-worked-out insights—on issues like the meanings of empty subject-terms, of existence denials, sentence-holism versus word-atomism, secondary (or metaphorical) versus literal (or first) meaning, the role of the speaker's intention in meaning-determination, and so on— sometimes dazzled our eyes. Far too many resonances were traced, rather stretched anticipations were highlighted, and momentous distinctions were slurred over. Among the many confusions (naturally and productively paving the way to clarifications!) that have arisen out of these reinterpretations of classical Indian epistemology and philosophy of language in the contemporary philosophical idiom, haziness about the concept of *word-generated awareness* (*śābdabodha*) is an important one.

The Sanskrit word *bodha* is derived from the same root as *buddhi*, which is announced to be synonymous, at least in the relevant philosophical tradition, with other words like *jñāna* or *upaiabdhi*, which mean (usually episodic) "awareness," "cognition," "or apprehension." Interestingly, in

modern regional Indian languages, *bodha* sometimes means "understanding" or "grasp of meaning." Hence the natural tendency to interpret *śābdabodha* (where *śābda* means "caused by *śābda* or word") as "understanding of a sentence." But as we look carefully in the literature, we find that what in Western philosophy (and common English) is meant by "understanding of a sentence" is quite different from what in Nyāya philosophy goes by the name of "the awareness generated by the sentence" (alternatively called "awareness of the *relatedness* of the meanings of the individual words in the speaker-intended order"). The point I am making may sound initially to be only terminological. When upon hearing you say that p, I come to know that it is the case that p—I am having word-generated knowledge that p. But this knowledge is by no means describable as my *understanding* of your utterance "P." My understanding of your utterance consists of my knowledge *of* what you mean to say, whereas my word-generated knowledge consists of my knowledge *that* what you say is in fact the case. However, the phrase "knowledge of what you mean to say" can be misleading. That is why, once this terminological confusion is clarified, the issue goes deeper. The more-or-less received wisdom of contemporary Western theory of language is that when a hearer listens to the utterance of a sentence "S" by a competent speaker, she *first* comes to recognize the force and content of the utterance (knows what speech act has been performed) and *then* goes on either to accept or to reject, that is, to believe or to disbelieve, the content. Let us roughly call this picture "Understanding followed by trust."

About both kinds of putatively speech-generated awareness—namely, *understanding* and *trust*—we could ask the following two questions: (1) Does it deserve the title of "knowledge"? and (2) Is it reducible to sense perception, inference, or memory, or is it a unique kind of knowledge?

But the most momentous contrast between the Western view above and the classical Indian (Nyāya) view of the matter lies in the tatter's tendency to reject the "understanding followed by trust" picture. If to understand your statement "Snow is white" is *not* to apprehend (with however shallow a conviction) that snow is white, then what is such understanding an apprehension *of*? The Nyāya—-like many contemporary philosophers—does not admit intentional entities like meanings, propositions, or Fregean senses. Unless we admit a beliefless noncommittal state of apprehension (which we might call "mere comprehension"), it becomes difficult to

answer this question without losing sight of the distinction between word-generated awareness (roughly, trust) and the so-called understanding. So, Nyāya regards the trusting reception of information as the primary cognitive attitude to meaningful, nonfictional, nonfigurative speech. I wish in this essay to address the following three issues.

(1) Is word-generated awareness (in the sense sketched above) classifiable as perception, memory, or inference?

(2) Does the Nyāya account of the content of word-generated awareness in the general terms of qualificand (subject) and qualifier (predicated property) *fail* to work in the case of sentences in the *nonindicative*—especially *imperative* or *optative*—mood?

(3) Is the Nyāya refusal to accept the "understanding followed by trust" picture based on a mistaken defense of gullibility?

My general thrust would be to try to gather arguments for a *negative* answer to all three questions. I discuss question (1) in sections II, III, V, VI, VII, and VIII. Question (2) is discussed briefly in section IV. Question (3) is discussed in the final section (IX).

II

One significant dictionary definition of the verb "to tell" is "to make known." Under normal circumstances S can make p known to H only if she herself knows that p. Hence, the idiom of *"transmission"* of knowledge. Through the words of a language, the same piece of information (something which will be captured by the Nyāya epistemologists as two or more knowledge episodes with *identical* content structure), as it were, travels from the honest, true-believing, generous speaker to the inquisitive hearer who has mastery over the language in question. This was once described by John McDowell as the phenomenon of contagion of knowledge:

> If someone knows that p and says that p, then typically someone who hears and understands him is in a position to know that p.[1]

Of course, not all telling is knowledge-generating. The speaker herself could be mistaken, she could lie, she could be joking, she could be telling

stories. That is why, when explaining the concept of a reliable authority, the "*āpta*", Vātsyāyana comments:

> By "*āpta*" is meant any informer who has himself somehow directly apprehended the matter and is impelled by a natural desire to communicate facts as he has found them…. This definition applies equally to sages who have had direct vision of truth, to Aryans, and to Mlechhas or heretics.[2]

Two things are to be noticed. First, it is not enough to know the truth. Someone may know the facts, but either because she lacks the desire to pass this knowledge on to others, or because she is too lazy to talk communicatively, or deliberately refrains from telling the truth, or because he has a perverse misanthropy in him, he or she may not tell the truth or state it otherwise. But as long as there is no reason to suspect such abnormal features as mistake, delusion, deception, or defective sensory mechanism, the speaker can conventionally be taken not only to be one who *expresses* his *purport* but also to be one who communicates *facts*, giving us not only a piece of his mind but a glimpse of the world as he has known it.

Second, this is not intended as a defense of overcredulousness. It might appear as if in emphasizing this knowledge-spreading function of speech we are about to forget the notoriety which 'rumor'—typically untrue information—has for its tendency to spread. The admission of words as a source of knowledge is no defense of overcredulousness or gullibility. It is just the robust recognition of the fact that without this straightforward and natural method of handing down knowledge through language, not only religion or common morality but even science or historiography would be impossible. It is not *in spite of*, but *because of* the progress of science that larger and larger amounts of findings, premises, theories, results of experiments, and technical know-how have to be taken on authority or learned directly from uttered or printed words. If each individual or generation had to perceive *directly*, verify inductively, or work out everything from scratch, then, as a famous Sanskrit couplet goes,

> This world would be immersed in total darkness of ignorance, deprived of the light which we call "speech."

Unfortunately, the so called communication-intention theorists of language use, in their enthusiasm to explain the more sophisticated manipulative use of speech to induce in the hearer appropriate beliefs regarding the speaker's intentions, have tended almost to ignore this basic knowledge-yielding employment of our linguistic repertoire. McDowell draws attention to this feature of communication by reminding us of the evolutionary survival value of the capacity of sentient creatures to spread important news in the most practical way by making significant noises. The alarm cries of some birds at the sight of a predator are surely not used just for the purpose of inducing in the hearer a recognition of the squawker's intention to alarm, but simply to pass on the beneficial results of one individual's perceptual data to other individuals. Of course, the ability to raise a false alarm, epitomized in the tragic fable of the shepherd boy who was taken to be a habitual liar, marks the characteristically human exploitation of language to cry "wolf" when there is none! Michael Dummett remarks somewhere that we fully master the practice of speech only when we can tell or suspect lies. Yet we must not lose our grip over the basic insight that, after all, words stand for objects, and assertions are primarily used to record facts, statements get their meanings from the standard practice of intending and taking them to be true, commands are intended to be obeyed, questions to be answered, and so on. Just as all pretense, mockery, impersonation, and deceit have to be parasitic on out-and-out, genuine, honest behavior, we cannot but take the truth-telling, knowledge-transmitting, information-instilling use as the standard use of language. When the real wolf comes, we have no other choice but to cry "wolf" again!

III

The following story of the genesis of a standard utterance is related by Mathuranatha (in the seventeenth century) at the beginning of his gloss on the fourth part of *Tattvacintāmaṇi*.

At first, the speaker comes to apprehend a certain state of affairs (which will eventually be the complex meant by the sentence). Then he becomes aware of his own awareness. Next he desires that another person should

also acquire such a piece of awareness. As he recognizes that the utterance of a certain sentence should produce this desired occurrent belief in the other person, he wishes to utter such a sentence. Realizing that the exercise of the appropriate vocal chord and other parts of the mouth, and so on is both within his powers and conducive to the fulfillment of this desire of uttering a sentence, he tries to perform those vocal and other phonetic acts whence the successive distinct acoustic events happen, and thus emerges that string of articulate sounds which we call the utterance of a sentence.[3]

The story on the receiving end runs somewhat as follows. Sometime earlier, the hearer had come to learn either spontaneously or by explicit training, a series of such meaning-rules of the form "From this *word* that *thing* is to be understood" (where *words* include nouns, verbs, participles, suffixes, verb inflectors, and so on, and *things* include particular substances, stances, qualities, relational properties, universals, actions and events, numbers, and so on) about all the individual words occurring in the sentence issued by the speaker. He must also have learned how, semantically, to encash features of the sentence like word order, implicit contextual factors (if any) such as may be needed to disambiguate equivocal expressions by determining the speaker's *intention* on that particular occasion, and he must have cultivated a general sense of what sorts of objective combinations of things, properties, and relations meant by the words are (or are not) *fit* to be entertained as actually obtaining. Now, as he hears these words, his episodic or dispositional memory of their individual meanings presents to him the meant items, first individually and then as held together. After he comes to hear the last phoneme, he apprehends the contiguity of the mutually relevant words, perceives their mutual syntactic, grammatical, and semantic dovetailing, believes or at least suspects the meant complex to be *fit* to be actual, and then firmly believes that those meant entities are in fact related to one another in the alleged order by the intended relation. If, in the actual world, the entities *are* so related the resulting belief amounts to knowledge; if not, it is an error.[4] In either case it is a special sort of belief or awareness which is obtained through listening (with comprehension) to the well-formed utterance of a communicative speaker. If, in answer to a self-enquiry or an epistemic challenge in the form "How did I/you know this?" or "Why do you believe this?" one must

reflectively offer an honest introspective report, the standard form that the report takes is "*I heard it*" or "*I was told*" (one never says, in such circumstances, "I guessed" or "I inferred"). Appeal to the reliability, sincerity, seriousness, and so on of the speaker and so on or any coherence criteria or pragmatic success and so on comes at a subsequent stage when, according to Nyāya, you are not justifying or giving evidence for *what* you know but justifying or giving evidence for the claim *that* you *know* it.

IV

There is one problem very likely to loom large in any project of interpreting traditional Indian materials in this area in the contemporary Western idiom: the problem of the cognitive content of nonindicative utterances. Imperative or optative sentences like "Bring the cow" or "Beat the cow with the stick" are given in Indian epistemology as illustrations of knowledge-generating utterances, quite indiscriminately along with straightforwardly indicative utterances like "Buffaloes are grazing by the side of the river" or mixed statements like "Here comes the son of the king; let the man be driven out of the way!" This juxtaposition of commands and assertions is by no means careless or accidental. There were other rival schools (apart from the Nyāya, upon which we are basing our account here) which regarded only religious and moral injunctions, hence utterances in the Imperative mood, to be knowledge-generating. Without going into intricate detail concerning their views about scriptural (Vedic) sentences, we can just note here that such imperatives were taken by them to be on the one hand uncaused or unuttered by any human or even divine author or speaker, and on the other hand conveying absolute obligatoriness of certain rituals or prohibitedness of certain actions. As such, these commands could not possibly be *false*, (or even true) nor could their content be known by any other direct means, for perception or generalization therefrom could hardly ever tell us what ought to be done in a deontological sense. Some modern interpreters of such classical Indian views have tended to think that it is the replaceability of testimonial evidence which makes it unworthy of epistemic prestige in the case of statements of fact, whereas in the case of categorical imperatives, its very irreplaceability makes testimony respectable as a source of knowledge of duty. What was novel and—in the

traditional Indian scene— courageous of Nyāya was to extend the domain of *śabda* (word) as a source of knowledge to ordinary matters of fact— flouting deliberately the stricture imposed by other schools of thought as to the assignment of specific sorts of knowables to specific ways of acquiring knowledge. You could come to know the same objects or same sorts of things through many alternative ways of knowing. One can come to know that there is fire on the hill by walking up to the hill and observing the fire for oneself, or from a distance infer it by seeing smoke, which one has ascertained first as an invariable mark of fire, or from trustfully understanding an eyewitness' utterances to that effect.

To come back to our original uneasiness about the informational content of commands or requests or moral injunctions: for one thing, we must notice that the verb "to tell" is also used most naturally in the context of an imperative utterance. Just as someone *tells me what happened*, someone *tells me what to do*, where to go, what to bring, and so on. So, somehow the notion of 'what is told' must include both states of affairs which can or cannot *be the case*, and actions which should or should not *be done*. The Nyāya theory of action has a general rule: from cognition flows desire, from desire volition, from volition effort, and from effort the actual performance of the action.

The standard case of action-motivating desire comes from a triple awareness: (a) awareness that performance of the action will produce desirable results, (b) awareness that it will not produce undesirable results strong enough to counterbalance the former, and (c) awareness that such an act is within the power of the actor. Now, when S tells H to "Bring the cow," what H learns immediately from the utterance is the following: the addressee (in this case H, reflexively identified as "I myself when the information is *received* and as "you" when it is *passed on*) has to be an agent of the act of bringing the cow. Since information or messages received from utterances must be capable of turning into knowledge— and knowledge is somehow essentially linked up with the *truth* of the content— the informational content must be such that it can be *true* (or false) on standard appropriate occasions. As we know from the now-notorious problems of the separation and marriage of the assertoric force from/with the neutral content, in the Western analytic tradition, the only form which is suitable to bear *truth* seems to be the indicative form; thus the embedded content even of imperatives had to be construed in the qualificand-qualifier

form, which is the Nyāya substitute for the Western subject-predicate form of "basic combination." Orders are not as such capable of being *true* or *false*, hence Dummett's suggestion that we modify their correctness condition as *obedience conditions*. So the troublesome bit, namely "*a* has to be *f*" or "make *a* become *f*," in our initial construal of the content of an imperative utterance is reparsed as a *kind* of predication, where the predicated property was not apprehended as already actually residing in the qualificand or subject, but as "intendedly residing" or "commandedly residing" therein. We must realize, of course, that for *f* to commandedly reside in *a, f* need not *somehow* actually reside in *a*; all it means is that *a is asked or desired to have f*. Hence the truth-biased reconstrual of the message passed on through "Bring the cow" runs as follows:

> The addressee is the seat of the commanded/desired agency, which is conducive to the action of bringing, which has the cow as an accusative.

To use Matilal's notation here, the content will look like this:

Q (you, Q (agency, Q (Bringing, Q (accusativeness, Cow))))

However, we must be cautious to interpret the *second* "Q" as standing for a special intentional qualification. It still remains difficult to imagine how the conditions of knowledgehood of the belief resulting from an imperative sentence will be enunciated upon this allegedly uniform account of meaning which somehow skirts the difficulties of the *sense and force* model. Obviously, it would be quite ludicrous to insist that for the command to be 'correct' (that is, for it to be knowledge-generating) the addressee should already *have* the agency toward the action which he is asked to do. No command to shut the door can be felicitously issued to one who has already shut it. Indeed, it is the *absence* of the agency to the action commanded which, normally, entitles the addressee to be asked to do it. But here, again, we seem to have missed the mark. We were not looking for the conditions under which there exists a *point* to issuing the command. The *point* of the utterance has to be distinguished from the *message* encoded in it. In this case, the message seems essentially to *involve* the idea of the addressee's being *required/desired/obligated* to perform an action. Hence the command is rightly understood if and only if one knows *what action the addressee is desired to perform*, which translates in the qualification idiom as: *of what speaker-desired action the hearer is to be an agent*. This is how, roughly,

uniformity of interpretation is achieved across indicative and imperative forms of utterances. When we come to think of it, we do quite naturally learn from 'instruction' (for example, "First remove lid, then unscrew handle…") in printed manuals without bothering to bring in the speaker. What knowledge do they generate in us? When I read *commands* (in a manual or on a computer screen), I know *that* I am supposed to remove the lid or press the "start" key. Quite straightforwardly I (the addressee) am the subject or qualificand and "being supposed to do this or that" is the predicate or qualifier. Thus the awareness generated by the imperatives doesn't have to bring in the speaker (there might be none) into the content.

V

With these preliminaries provisionally cleared up, we can now approach our central question: is verbal testimony an independent way of acquiring beliefs (which may turn out to be pieces of *knowledge*)? Gaṅgeśa (early fourteenth century), the father of the New Nyāya, rejects the suggestion that testimony is not a source of knowledge *at all* rather summarily with a quick pointer to a self-refutation. When the hypothetical discreditor of testimony *tells* us: "Words can never give us knowledge," how are we to take *that* statement? Do those words uttered by the antagonist of word-generated knowledge give us any knowledge? If they themselves do not convey any knowledge then the antagonist's statement is simply not *true*. If that statement is true, that is, if those words themselves convey knowledge, then words do, on this occasion at least, generate knowledge in us and hence the falsity of the antagonist's contention. There is a patent performative contradiction in stating in words that words can never arouse true beliefs. But such an easy victory was not to Gaṅgeśa's taste. So he considers the possibility that maybe those words of the skeptic or the heretic arouse in us a sort of inner mental awareness which can reveal the unreliability of directly word-generated beliefs without itself being such a directly word-generated belief. All we have to prove in order to evade self-refutation is that such a mental awareness is a kind of perception or inference rather than itself a piece of special testimonial knowledge. Thus the question whether testimony is *at all* an admissible avenue of knowledge eventually reduces to the question whether all alleged cases of knowledge by testimony are

reducible to cases of memory, perception, introspection, or inference. Before we take up this real issue of independence or irreducibility of testimony as it was discussed in late medieval *Indian* epistemology, let us look once more at the corresponding *Western* scene.

Hume was one of the few modern philosophers in this tradition to attempt a sustained account of knowledge from testimony, and his discussion in the section on *Miracles* in the *Enquiry* (section X) has since then come to be regarded as the standard take-off point. He does not dispute the fact which has been reemphasized in more recent times by J. L. Austin as follows:

> If asked, "How do you know the election is today?" I am apt to reply "I read it in *The Times*" and if asked "How do you know the Persians were defeated at the Marathon?" I am apt to reply "Herodotus expressly states that they were." In these cases 'know' is correctly used: we know 'at second hand' when we can cite an authority who was in a position to know (possible himself only at second hand). The statement of an authority makes me aware of something, enables me to know something, which I shouldn't otherwise have known. It is a source of knowledge.[5]

All that Hume insists is that our reliance on witnesses, historians, reporters, and experts is *derivative* of our reliance on inferences based on inductive generalizations from observations of constant co-occurrence. Thus the threat to testimony, even here, is the threat of *reduction* to inference or, more ambiguously, to customary observation or experience. But as Coady (1973) has ably argued,[6] Hume's program of reduction can be damaged by a destructive dilemma. When Hume argues that we trust others' words because *we* have, in the past, experienced them to be true, what does he mean by "our experience"? If he means the experience of a *single* person (namely, the one who draws this conclusion from an inductive generalization treating the words as inferential *signs* of the truth of the report), then the diagnosis is simply false because the range of observation of a single person hardly justifies any such claim to know such a general connection between assertions and facts. Simple reports like a letter from a friend which arrives by post and tells us that the friend is writing from thousands of miles away, could not be trusted with any degree of certainty if one had first to ascertain by observation all by oneself all the relevant

types of facts which are involved in the postal path of a letter arriving from a considerable distance. As we pass on to more specialized scientific information, the observational responsibilities implied by a plausible claim of an inductively acquired belief become too absurdly enormous to be discharged by a single individual with limited time, expertise, and cognitive equipment. The only other alternative is to include *others' experience*, or a communal notion of experience in the sense of "we have experienced in the past." But the moment we do that we are bound to beg the question about our trust in testimony because the only standard way we come to know of others' experiences at such a sophisticated level of confirmation requirement is to hear their avowal or verbal reports. So the Humean attempt to reduce testimony to empirical reasoning is either completely unrealistic or circular.

Another sphere where the role of testimony Is almost irreplaceable is our knowledge of the meanings of words. At the superficial level, we have no conceivable way of challenging the authority of dictionaries and our language teachers. To insist that one can "look up" the lexicon on one's own, or "observe" usage instead of relying on the instructor's words, would once again be circular, for the role of perception in such "looking up" or "seeing usage" is deceptive. What we are basically doing to know "what means what" is to place trust on the expert's or native user's explicit or implicit, formulated or contextual definitions of word meanings. At a deeper level, Putnam's notion of division of linguistic labor brings out clearly the role of testimony in language acquisition. When the chemist tells me with appropriate demonstration of a certain substance that "This is sodium sulfate," I immediately come to know what that term means. How? By testimonial evidence, to be sure! Such facts about *meaning* actually determine our knowledge of facts about the *world*, in ways much discussed by Quine, Davidson, and Putnam, and both sorts of facts are thus seen to be known through trustful or—more accurately—distrustless comprehension of the utterances of competent speakers. We do not have to establish the separate trustworthiness of the source; it is enough if no evidence to the contrary is already available. So, the question is not at all whether testimony is a source of knowledge. It is simply dishonest to doubt that. If fallibility of our sensory equipment does not tell against the reliability of perception, and the general skepticism about validity of inductive inferences can be met by a naturalistic or pragmatic response, it will be

sheer prejudicial use of double standards to refuse the title of knowledge to testimonial true beliefs on the ground that all understandable utterances *could* be generally false. Indeed, as we shall try to argue toward the end of this essay, understandable utterances *could not* be mostly or generally incorrect, and we must therefore suppose that testimonially acquired beliefs do merit as much general presumption of truth as do our direct reports of perception. So the question, to repeat, is not whether the words of others constitute a source of knowledge at all, but whether they constitute an *independent* source of knowledge.

VI

There was a school of classical Indian thought which did not recognize any other means of knowledge except sense perception. Naturally, they either had to reject most of our nonperceptual knowledge claims or somehow had to reduce them to perception. Now, the best way to classify our knowledge obtained from hearing and comprehending the true utterance of a generous, unsecretive, and competent speaker as perception is surely not to insist that, through the words, we actually see or touch or taste or smell the objects talked about physically. To listen to an account of any incident would then have to be something like the experience described by Aldous Huxley in *A Brave New World*, of watching a "Feelie" (where not only sight and sound but all of the five aspects of sense experience are reproduced). No ordinary contact between sense organs and the objects about which information is orally received could be postulated. Hence the perceptualist reductionists resort to the so-called extraordinary contact, called contact-through-memory-awareness (*jñāna-lakṣana-sannikarṣa*). It could be held that because, on some previous occasion or other, the hearer must have perceived individually the items or kinds of items talked about by the speaker, his memory of those objects (including substances, qualities, relations, and so on) aroused by the use of the relevant words serves to establish an extraordinary contact between his senses and those items themselves—and thus the communicative intent becomes perceptually presented to him by his listening to the utterance, given that he is semantically trained. Against this suggestion, at least three strong arguments have been given.

First, there is a phenomenological, introspective evidence to the effect that what we learn from a sentence is not immediately afterwards felt as something that we have seen, or directly perceived, but as something which we have "heard" in that special nonsensuous sense of hearing in which we hear messages rather than just noises. Although after some very lucid or vivid verbal explanations we make the remark "I see" or "I can almost feel it" (hence the analogy with that extraordinary type of perception of sandalwood as *looking* fragrant or that of a rotten pastry as *smelling* sour), our reception of verbally communicated information is not intuitively felt to be *direct* or *presentative* in nature. (Of course, it would be rash to conclude that since it is *indirect* it must be *inferential*, as Fricker [1987] seems to have done.)[7]

Second, the order or direction of qualification involved in the complex content of the qualificative awareness resulting from hearing a sentence is irreversibly determined by the word order and the nominal case endings and other inflective marks. Thus from an utterance of the sentence "the table is brown" we shall never have the awareness where the *color brown* figures as subject and *inhering in the table* figures as the qualifier. It has to be an awareness of the table qualified by the brown color. But the qualification structure would have been reversible as long as the fact captured remains the same, had the experience been *perceptual*. When I *see* that the cat is on the mat I can be correctly described to have seen that the mat is under the cat as well. Direct access gives us a freedom to rearrange my empirical content while testimonial knowledge remains bound to the order dictated by the words.

Third, once we rely on memory-assisted perception, we have to include in the content of our alleged testimonial knowledge all that I am reminded of by the utterance or at the time of listening to it. In perceptual experience, the subject is well known to be helplessly at the mercy of the senses, and when the links of stored past experience are added, the chances of being perceptually presented with data far exceeding the bare meaning of the utterance are very high. We might be reminded of some accidental feature of the speaker (that he is a Californian, or has blocked nostrils, for instance) by the special accent or tone which we cannot help hearing along with the utterance. If the utterance were "Oxford is a boring city," the resulting perceptual content would be something like the proposition that *a*

Californian believes that Oxford is a boring city. But that is not the word-generated belief that we wished to capture by the perceptual reduction.

Actually, perceiving the mere words never gives us the putatively *perceptual* knowledge of the reported fact. We have to be aware of the contiguity of the words uttered, their syntactical 'expecting' of each other, and their fitness to represent a situation which is not known to be nonactual, and so on, and if all these conditions are fulfilled, we need not construe the resulting knowledge as a memory-linked, extraordinary perception artificially confined only to the properly word-recalled objects, but can more parsimoniously and realistically admit that this was a noninferential, nonperceptual, word-generated awareness of the meant relation between just the meant entities—no more, no less.

VII

If it is not reducible to perception, then our putative knowledge from other's speech is even less likely to be regarded as a straightforward case of remembering. We can come to understand and have true beliefs about situations which we *never* witnessed perceptually before we heard the sentence which describes the situation. If testimonial knowledge were to be a subclass of memory cognition, then we could claim to be informed only by sentences which describe a state of affairs which we have, ourselves, directly experienced before. The whole point of telling others about places, subjects, events, and discoveries of which the listeners have no direct experience would be foiled.

VIII

We can now consider a few of the attempts to reduce word-generated awareness to inference. Two types of inferences have been proposed by the philosophers (Vaiśeṣika school) who try to subsume testimony under inference, namely, those which revolve around the words or the utterance itself and those which revolve around one or more of the *objects* whose mutual relatedness is asserted by the utterance and grasped by the audience.

To consider briefly the first sort of inferential reduction, suppose the sentence uttered is "That cow is white." The inferential reformulation of the knowledge generated by this cluster of words will run somewhat as follows. (We are following the Nyāya model of inference where there is a subject of inference, that is, *a place, pakṣa*, for example, a hill, in which a predicated property, *the inferable, śādhya*, for example, a fire, is established, via the presence of a sign, reason, middle term or *mark, hetu*, for example, smoke, which is known to be connected with the inferable by a relation of *pervasion, vyāpti*, or invariable unconditional concomitance.) The words "that," "cow," "is," and "white" (= the place) have the property of having been uttered due to or preceded by an awareness (in the speaker) of the purported relation between the purported qualificand and the purported qualifier (= the inferable), because they constitute a string of words connected to each other by syntactic and semantic expectancy and compatibility of meanings, and so on (= the mark).

But even if the inference goes through, it only makes us know, if anything at all, the fact that the speaker himself, before uttering the sentence, must have believed that such and such is the case (that the cow is white). How does that generate in the hearer the same belief?

For one thing, the features of a sentence which serve as the "mark" of an inference—like contiguity and expectancy of words, fitness of the meant complex of entities, and so on—must be *known* and firmly believed in, in order that the inference can be epistemically effective. We never arrive at the conclusion of an inference from a shaky awareness of the reason, ground, or mark. Yet it is well-established that we do not have to be certain about the mutual expectancy of the words; it is enough if they, *in fact*, have that feature. We definitely do not need to have a prior firm belief in the factual fitness of the meant content in order to acquire knowledge from the utterance of the words. It is enough if we can entertain the possibility of the individual meanings of the constituent words to be factually combined. (We do not receive any information, even doubtfully, from a sentence like "Mrs. Thatcher had three wives," because we have a firm belief in the *unfitness* of the content.)

The preceding inferential reconstrual, therefore, in a way yields a belief with both *more* and *less* content than the belief which it was expected to account for. It is richer in content than the alleged testimonial knowledge because it is a belief about the speaker's belief and not about a cow, which

is what the disputed testimonial knowledge is about. Each time S utters the sentence "a is f," S does not manage to or want to *say* that S believes that a is f. The latter involves references to S and S's mental states (its belief) besides a and f. Gaṅgeśa at this point anticipates the problem of referential opacity of intentional contexts and says that we *cannot* argue at this point that, after all, in knowing S's belief about a's being f we also come to know that a is f. This may seem to be the requirement if one follows *blindly* the Nyāya account of the causal mechanism of all multiply qualificative cognition. We could not be aware of a multiply complex qualificative content, for example, Q (Q (A, f), Q (B, G)), unless we are first aware of each embedded qualified qualificand and qualifier. Unless you believe that the stick is red you cannot come to believe that the man is carrying a red stick. Similarly, if you read, as Nyāya usually does, all awareness in a *de re* manner, then, to be aware of S's awareness of a's being f, you have to know first that a is f, because (again, to use Matilal's notation) the content of the belief about S's awareness will be

$$Q (S, Q (\text{awareness}, Q (a, f)))$$

—and in order to arrive at the whole content you must causally and epistemologically work your way back from the innermost qualified content.

But to this Gaṅgeśa raises the insightful objection that, if this were always required, then whenever we ascribed a mistaken belief to another person we would ourselves be mistaken. Thus, God, being aware of all our errors, will actually have to be in error Himself. This brings out why the conclusion of the inference gives us *less* information than what the sentence conveys. Hence, our inference about the utterance U being generated by the speaker's belief that p would not take care of our word-generated awareness that p is directly generated by our listening appropriately to the utterance U. There are many other sophisticated and more carefully constructed versions of the attempted inferential reading of testimonial evidence, but let us pass on now to the other type of inference, namely, where the meant entities themselves figure as *subjects* or *places* where some relevant properties are inferred.

Take the sentence: "John is ill.' This generates in anyone who has mastery of English, who knows who this John is, and who does not question

the credibility of the speaker, the belief that John is ill. Is this belief inferentially obtained? Could it be an inference *about* John (whom the hearer has seen before and now is reminded of by the utterance of his name), an inference to the effect that he has the property of illness (and thus that the predicated property will be the *inferable* and John will be the *place* or subject of inference)?

What will serve as the *mark* or ground for such an inference? Obviously, we have nothing to go by except some features of the words or the sentence as heard and interpreted by the speaker. But the features of words like contiguity, expectancy, and so on could not be *marks*, because the marks and the inferable must be capable of residing in the same locus; at least the mark should be believed to reside in the subject of inference. But features like contiguity or expectancy are syntactic and semantic features of the *utterances* which cannot be looked for in *John* or any of the meant entities. So the mark will be essentially faulty. In response to the difficulty above we could somehow manipulate the *mark* so that this defect of *unavailability* in the *place* of inference does not vitiate it. We could dress up the inference as follows: John (= the place) has the property of illness (= the inferable), because he is recalled by the word "John" in a sequence of words where the other words "is ill," meaning what they do, have the property of "expecting" the word "John." But to tighten up this inference into a valid form, we have to add the semantic feature of "fitness" of the meant entities —once again, because we can never validly *infer* the actual obtaining of the state of affairs reported by an utterance by merely arguing on the basis of syntactic or grammatical features of the utterance. Once we presuppose knowledge of such a semantically strengthened *mark*, we shall actually assume, within the premises of the inference, a prior knowledge of the *truth* of the information, thus rendering all knowledge from testimony into a reknowing of the already known. The inferences become epistemically circular, and the essential freshness of testimonial knowledge is lost.

IX

I started by distinguishing between understanding and word-generated knowledge. The distinction is not drawn in terms of truth or falsity or correctness or incorrectness. There is no tendency in Nyāya to hold that

word-generated awareness is always *knowledge*. We can have false belief generated by believingly comprehended false sentences. The contents of such false beliefs are neatly explained by the general Nyāya technique of assigning misallocated intentional *roles* to bits of the real world, without postulating Fregean false thoughts or Moorean propositions as nonactual floating targets of shared false beliefs or any such twilight entities! Even such false beliefs are word-generated beliefs. So the problem is not with false awareness of contents but with *unbelieving* awareness of contents. Even for one special sort of unbelieving awareness of contents which may result from a sentence known by the hearer to be semantically unfit, that is, patently false, Nyāya has an account. This is the notion of a conniving or mock awareness which is exploited in giving an account of our interpretation of fanciful tales or our attitude toward a contention which we are going to refute. Fitness is no longer a condition; it is rather that a firm awareness of unfitness causes such fictional apprehension of unfit contents. But it seems really like a lacuna in Nyāya philosophy of language (somewhat compensated for by the Grammarian philosophers, who were happier to suppose such intentional entities with ontologically emaciated status corresponding to empty terms or false sentences) that nothing like a propositional content is ever admitted to serve as the object of a belief-free grasp of the meaning of a sentence. It has been established almost without controversy in Western epistemology and philosophy of language that we must grasp the content before judging the content to be true. Although Frege himself drew our attention repeatedly to the informational vacuity of the adjective "true" so that knowing that p, and knowing that p is true, could always collapse to the same thing, it was he who insisted upon a distinction between the three acts of: (1) apprehending thought content, (2) judging it to be true, and (3) asserting it to be true. More recently, Gareth Evans has explicitly formulated the principle of *belief-independence of informational states*:

> [T]he subject's being in an informational state is independent of whether or not he believes that the state is veridical.[8]

But the examples that he gives are of illusions and false impressions which persist even after clear recognition of or firm belief in the non-veridicality of the experience. It is unclear, however, how, without positing ontological

entities like Fregean *thoughts or propositions* (subsisting but not existing), one can call such states "states of *knowledge*." If such beliefless understanding is called knowledge (and sometimes it is said that such knowledge is more definitely obtainable from hearing sentences in a familiar language than *knowledge of the fact* reported in the sentence), then what is it a knowledge of? To answer that it is the *knowledge of meaning* gets us nowhere. If we want to retain our robust sense of reality then we cannot claim to have knowledge of some entities called 'meanings' without *believing* that such meanings are there in the world for us to know them. To continue to insist that the *being there* of the meant content does not constitute the existence of the fact which the sentence would have pictured if it were true is to be left with only one alternative apart from the unpalatable Fregean third realm of the senses, namely, Wittgenstein's Tractarian notion of states of affairs which might or might not exist.

I am myself very much inclined to do justice to what Evans calls the "most subtle and complicated phenomenon" of the ontologically noncommittal language games of giving and receiving information without the full load of belief in their reality. Yet it seems unavoidable to have the believing awareness of content as the *standard* and *normal* case, and build our theories of unbelieving understanding (for example, of jokes or fictional sentences) *derivatively* upon them. To make an account of a normal, serious, information-instilling use of language necessarily go through this murky state of belief-free presentation of contents (when we do not know where in our ontology to accommodate such floating contents) seems to be inviting obfuscation! I am sure that we do unbelievingly understand a lot of utterances, but it is too much to argue that all knowledge of facts through testimony has to go through this noncommittal state of belief-free information intake.

It is only when we have a two-step theory like the one I have been arguing against that we tend to treat the end belief of the credulous audience as inferential, and often inadequately warranted at that. Interestingly enough, Fricker calls the so-called second step (coming to believe that the grasped content is actually the case) the *first-level hearer's belief*. Her notion of *second-level hearer's belief* is, of course, different from that of understanding; it is not belief-free. It is a belief, not about the world, but about the speech act performed by the speaker. Nyāya will have no trouble with that. Surely when I hear you utter a sentence, I perceptually recognize

that you have made an assertion with a certain content. This could be perception. I can also make an inference from this to the effect that you *want* to tell me something by the use of that sentence. But this is not what Nyāya would mean by "word-generated knowledge," because your words did not say "I am making an assertion that…." To be *informed* by your assertion is to believe that what you assert is the *case*.

And this belief can turn out to be *knowledge* when the assertion is true and my apprehension of it follows the intention of the speaker and the grammatical and lexical rules of interpretation of that language. To continue to cling to the view that my (second-level) knowledge that an assertion has been made (and so on) is somehow securer and better justified than my claimed knowledge that what is asserted is the case is to succumb to the skeptical pressure—which Fricker does— *that all intelligible speech could be consistently and systematically* taken as *false*. Thus Fricker draws the corollary from her *inferential* account of first-level hearers' beliefs (the Nyāya *śābdabodha*): "that it is perfectly coherent to suppose an individual who understands others' utterances perfectly, and yet never believes what they say." She goes on to say that such an individual would indeed be "odd." But this word of disapproval is misleadingly mild. I think it could be shown following Davidsonian lines that entertaining such uniform unbelief would deprive the distrustful interpreter of even his capacity to *interpret* correctly. "Too much actual error robs a person of things to go wrong about."[9]

Of course, knowledge is not easy to come by. We must be very cautious. But, the skeptical possibility of the entire web of our beliefs about the world being massively mistaken is no *more* infectious or genuinely threatening to testimony-transmitted beliefs than to our perceptual resources or to our nondeductive inferences. If all this sounds like a defense of gullibility then gullibility needs some defense.

NYĀYA THEORY OF DOUBT

JITENDRANATH MOHANTY

I

The Nyāya logic contains a theory of doubt. A preoccupation with the nature, origin and structure of doubt seems out of place in a logical system inasmuch as logic has been taken to be concerned, speaking rather broadly, with formally valid thought abstracted from its psychological context. Now, Nyāya logic—in fact all Indian logic—does not conform to this conception. It is in a broad sense coextensive with, and indeed indistinguishable from, a theory of knowledge, and concerns itself with all kinds of knowledge, the non-propositional and the invalid ones not excluding. In a narrower sense it is of course a theory of inference.[1] But even as a theory of inference it does not (i) concern itself with the bare form, though some amount of formalism has been developed, and (ii) it does not separate logic from psychology in a way that western formal logic has done. Consequently, it is as much interested in the psychological conditions of the origin of a certain type of knowledge, say e. g. of inference, as in the conditions of its logical validity[2].

It is in the light of these remarks about the general nature of the Nyāya logic that we are to understand the reasons for its preoccupation with doubt. For, inquiry (or, as the Nyāyabhāṣya says, *pramāṇairarthaparikṣaṇām* i. e. the attempt to determine the nature of the object with the help of the various sources of true knowledge) presupposes a prior state of doubt; though the Nyaya allows for the case where we make an inference even when there is prior certainty, there being however a special desire to infer. The fact remains however that apart from such cases of intellectual curiosity to provide reasons for what one already knows for certain the most important stimulation for making an inference is provided by a doubt about the presence of the *sāidhya* in the *pakṣa* (e. g. of the fire in the hill

It is further important to bear, in mind the fact that for the Nyāya, as for most systems of Indian philosophy, doubt is a species of knowledge, so that

if I have a doubt of the form 'Is S p or not?', most Indian logicians would say that I am having a knowledge—though not a valid one about S. This rather strange contention, so much at variance with both the philosophical and the ordinary usages of the English word 'knowledge' may be accounted for in either of two ways. It may be either that the Indian philosophers, supported by the conventions of the Sanskrit language are using the word in such a wide sense as to include even doubt and error. Or, it may be—and this seems to me to be the more reasonable account—that the Sanskrit word *'Jñāna'* should not be rendered into the English word 'knowledge', so that doubt and error are species of *Jñāna* but not of knowledge. *'Jñāna'* means any conscious state which is characterised by a reference to an object beyond it, and surely doubt and error are states in which we are conscious *of* something. To be conscious of something amounts, according to the Nyāya, to having a *Jñāna* about that object.

There are various classifications of *jñāna*, the most usual one being into *anubhūti* and *smṛti* (memory). The former may conveniently be defined as all *jñāna* other than memory. *Anubhūti* again is usually subdivided into *pramā* (or true) and *apramā* (or false). A true *jñāna* is one in which the object is known exactly as it is, and a false one is one in which the object is known as what it is not.[3] False *jñāna* is either doubt or error. It may be noted that the exact equivalent of the English word 'knowlede' is, in this scheme, *'pramājñāna'*. Doubt is a kind of false *jñāna*.

Since it has now been pointed out that *'jñāna'* is not strictly synonymous with 'knowledge', we shall henceforth in this paper use the word 'knowledge' *as if* it were so synonymous, and leave the matter at that with the hope that there is no further scope for misunderstanding.

II

The *Siddhāntamuktavaĭ* defines doubt as a knowledge which is *ekadharmikaviruddhabhāvābhāvaprakārakam*, i. e. a knowledge which has (two) contradictory *prakāras*— one positive and the other negative—but referring to the same substantive. From amongst the host of definitions to be found in the Nyāya literature, this one may be singled out for its precision and simplicity, and may be worthwhile to fix upon it. For an

explanation of the definition it is of course necessary to prefix a few words about the concept of *prakāra*.[4]

It is well known that according to the Nyāya, knowledge is ontically formelss (*nirākāra*) and owes its determinations to its object. It is however capable of being logically analysed. Possibility of such analysis presupposes that knowledge has forms of its own in a quite different sense. But what precisely is this sense? The Nyāya no doubt advocates a direct realism, and holds that knowledge in an important sense has no forms of its own, that it is *nirākāra*, its specific forms being derived entirely from its object. However, the Nyāya also believes in the possibility of analysis of knowledge, which presupposes that knowledge has its constituent logical elements and relations.

In primary unreflective attitude, knowledge is directed towards its object but not towards itself. The content of knowledge is brought to light only in the subsequent reflective attitude. In this reflective awareness, it is the contents of the primary knowledge that are directly intended, whereas the object of the primary knowledge is intended only as ancillary (*puchchhalagna*). All such contents of knowledge which reflection discovers are brought under one category, technically called *viṣayatā* which again is further subdivided into three sub-categories: *vśeṣyatā, prakāratā* and *samsargatā. Viśeṣyatā* is the general title for all knowledgercontents referring to substantives *prakāratā* for all contents referring to adjectives, and *samsargaā* for those that refer to relations.[5]

For illustration, consider the knowledge expressed in the judgment 'This is pot' (*Ayam ghato*). This knowledge may be analysed, at the first instance, into the following contents:

(i) a *prakāratā* referring to (the Nyāya would elliptically say, ('attached to') pot-ness;

(ii) a *viśeṣyatā* referring to the pot (in so far as potness qualifies the pot)

(iii) a *prakāratā* referring to the pot (in so far as the pot is a determination of the mere *this*);

(iv) a *viśeṣyatā* referring to the *this* (in so far as it is determined by the pot);

(v) a *prakāratā* referring to this-ness (in so far as it qualifies the *this*);

and (vi) a second *viśeṣyatā* referring to the *this* (in so far as it is qualified
by this-ness).

Let us now introduce a few symbolical devices with a view to facilitate a schematic representation of these contents in their mutual interrelations.

We symbolise a *viśeṣyatā* by enclosing the name for the corresponding element within the braces {}, and a *prakāratā* by enclosing the name for its corresponding element within the braces ().

Thus ' {this}' and '(pot)' would read as 'the *viśeṣyatā* referring to *this*' and 'the *prakāratā* referring to potl respectively.

If and when a certain *prakāratā* determines or limits a certain *viśeṣyatā* we shall simply write the symbol for the *viśeṣyatā* first and write that for the *prakāratā* after it. Thus ' {this} (pot)' would read as 'the *viśeṣyatā* referring to *this* is determined by the *prakāratā* referring' to poť.

Enclosing the whole analysiens by the brackets [] and writing K before it, we shall symbolise the knowledge whose logical structure is exhibited within the outermost brackets. Thus 'K [{this} (potness)}' is to be read as 'the knowledge whose *viśeṣyatā* referring to *this* is limited by the *prakāratā* referring to potness'.

'.' would symbolise 'and' and '~' would symbolise 'not' Thus 'K [{s} (p). {t} (q)]' would read as 'the knowledge whose *viśeṣyatā* referring to s is limited by the *prakāratā* referring to p, and whose *viśeṣyatā* referring to t is limited by the *prakāratā* referring to q'. But 'K [{s}((p). (q))]' would read as 'the knowledge whose *viśeṣyatā* referring to s is limited by two *prakāratās*, one referring to p and the other referring to q'.

'K [{s} (~p)]' would read as 'the knowledge whose *viśeṣyalā* referring to s is limited by the *prakāratā* referring to the negation or *abhāva* of p'. But 'K[{s} ~(p)]' would read as 'the knowledge whose *viśeṣyatā* referring to s is not limited by the *prakāratā* referring to p. K [{s} ~(~p)] would on the other hand read as the knowledge whose *viśeṣyatā* referring to s is not limited by the *prakāratā* referring to the negation of p'.

The Nyāya defines a *niścaya* or a certain knowledge as one which, not having ~p as a *prakāra* has p as a *prakāra* (where, as here, p is a term-variable).[6] Following the symbolic conventions stated above, we may then define a *niścaya* as

$$K [\{s\}(p). \{s\}\sim(\sim p)]\ \ldots\ldots(1)$$

As contrasted with *niścaya*, a doubt may then be defined as a knowledge which has two mutually incompatible predicates (*ekedharmika-*

viruddhabhāvāvaprakārakam) one of which is the negation of the other. In the case of the doubt 'Is this a man or a lamp-post?, two mutually incompatible predicates are being employed. It is however not sufficient for a knowlodge to be called a doubt that it should have two incompatible predicates, for it may be—as in the case of the so called *samuccayajñāna*—that the two incompatible predicates are referred to two different subjects (e. g. 'This is a man and that is a lamp-post). If *samuccayajñāna* is to be represented symbolically as

$$K [\{s\} (p). \{t\} (q)^1 \ldots\ldots\ldots(2)$$

a doubt has to be represented as

$$K [\{s\} (p). \{s\} (q)]$$

, where p and q are mutually incompatible predicates ……………(3)

Thus there are two essential components of doubt. In the first place, the predicates must be mutually incompatible. Secondly, they must be referred to the same subject. We shall enquire a little more into each of these.

That the predicates of a doubt should be incompatibles is suggested by the connective 'or'.[7] The *Rāmarudri* defines incompatibility thus: *"virodhaśca tadadhikaraṇāvṛttitvam"*.[8] On this definition, to say that p and q are incompatibles would mean that one of them is never present in the locus of the other. The author of the *Nyāyalīlãvalī* is not satisfied with this definition of incompatibility, for in that case the definition of doubt would illegitimately apply to such a case of error as 'This conchshell is yellow' whose analysis may be stated as [K {this} (conchshellness). {this} (yellowness)], where, granted that conch-shells are always white and never yellow, the two predicates are incompatibles according to the definition of 'incompatibility' given above. It is necessary therefore that the two predicates should be logical contradictories, p and ~p, one of which is *bhāva* and the other *abhāva*. Doubt in that case would be defined as *'bhāvābhāvaprakārakajñānam'* and symbolically represented, instead of (3), as:

$$K [\{s\} (p). \{s\} (\sim p)] \ldots\ldots\ldots\ldots(4)$$

The adjective *viruddha* (incompatible, or opposed) may still be regarded as not redundant inasmuch as there may be cases where p and ~p may be predicated of the same subject without it being a case of doubt, as e, g. in the judgement 'The yonder tree both has and has not contact with a monkey.' In this case, contact with the monkey (*kapisamyoga*) and absence of such a contact may both be rightly predicated of the same thing at the

same time, for it may have the contact in one part of it, and absence of it in another part. *Dinakarī* therefore suggests that the adjective *'viruddha'* has significance. Even the contradictory predicates must be really incompatibles. Doubt then is *'viruddhabhāvābhāvaprakārakajñānam*!* [9]

I think, however, that the adjective *'viruddha'* is superfluous. The two predicates 'contact' and 'absence of contact' become incompatibles as soon as the subject is further determined. That the subject of both is to be the same implies, strictly understood, that the two subjects must have the same limitor (*avacchedaka*). Referred to the same tree in the same part of it at the same time, i. e. in the same patio-temporal limitations, the two predicates would certainly constitute a case of doubt.

This shows the importance of the second component of the definition of doubt, namely, the requirement that the two predicates must be referred to the same subject. The idea of sameness is deceptive. Consider a deliberate contradictory judgment (*āhāryajñāna*) of the form 'This hill without fire has a fire in it' (*nirbahni parvato bahnimāniti*) whose form is 'S which is ~p is p.' Here two mutually opposed and contradictory predicates are being referred to the same subject, and yet we do not have a case of doubt. Following *Rāmarudri*, we may say that the analysis of such a case shows its form to be

$$K [\{s\} (\sim p)] (p)] \ldots\ldots\ldots(5)$$

which is differeut from K [{{s} (p). {s} (~p)] The difference, likely to be obvious from a mere inspection of the two schemata, lies in the fact that in the case of (5) ~p is predicated of mere s whereas p is predicated of s as qualified by ~p, while in (4) both p and ~p are predicated of one and *the same* s.

The definition may nevertheless seem to apply to cases of deliberate contradictory judgements of the form "S is both p and ~p" which clearly are not cases of doubt: However, such judgements may be regarded as carrying only *śābdajñāna*, so that the *prakāras* are not p and ~p themselves but the property that p and ~p are prakāras (*virodhinānāprakārakatvaprakāraka*). This serves to distinguish a mere *śābda* awareness of a contradiction from a doubt where p and ~p themselves are the *prakāras (virodhinānāprakāraka)*. This ingenuous distinction drawn by Vardhamāna both in *Līlāvaliprakāśah*[10] and in *Kiraṇāvaliprakāśah*[11], may have its source in the consideration that a *śābda* knowledge is mediated through a sentence, so that in this case of merely verbal knowledge, p and ~p directly qualify the

sentence and the fact of their so qualifying the sentence may then be regarded as qualifying the resulting knowledge. In our symbolism, this case may be represented as

$$K\left[\{s\}.\left((p).(\sim p)\right)\right] \ldots\ldots\ldots\ldots(6)$$

Gadādhara holds that the two contents or *viṣayatās* belonging to a doubt have the following three properties:

(i)   One of them is incompatible with the other in the sense that one acts as a hindrance (*pratibandhaka*) to the other:

(ii) neverthless, the two are co-present;

and (iii) the one content belongs to the knowledge only as qualified by the other., and therefore not as an independent content.[12]

The Naiyāyikas have further discussed the question — not of great importance though — if a doubt has two predicates or four. Added to this is the controversy, touched upon earlier, as to whether in case there are two alternatives they are both positive incompatibles or logical contradictories. We get accordingly three schemata which may be exhibited as follows:

(a)   Two positive alternatives theory:

$$K\left[\{s\}(p).\ \{s\}(q)\right], \text{ p and q being incompatibles.}$$

(b)   One positive and the other negative alternative theory:

$$K\left[\{s\}(p).\{s\}(\sim p)\right]$$

(c)   Four alternatives theory:

$$K\left[\{s\}(p).\{s\}(\sim p).\{s\}(q).\{s\}(\sim q)\right]$$

There seems nevertheless to be something about a doubt which escapes the attempt to analyse it logically. We may grant that the Nyāya is not committing the obvious error of mistaking a doubt-sentence as a prepositional one. What the Naiyāyika seeks to analyse is not the sentence, not the proposition certainly in this case — for there is no proposition here — but the *jñiāna* as apprehended in reflective awareness. In spite of all this we may nevertheless point out that the above analysis still misses something essential to doubt *qua* doubt.

There were amongst the Naiyāyikas some who sought to reduce a doubt-sentence to the compresence of two contradictory assertions *S is p* and *S is not p*. This view traditionally ascribed to the author of *Ratnakoṣa* is voiced by Gaṅgeśa, when he in course of an argumentation with the Mīmāmsakas, contends that doubt is *nothing but* such joint predication.[13] Happily, this view is not shared by Gaṅgeśa himself, for he tells us soon after that doubts

are characterised by *Kotyutkatatva*, i e. difference in the relative strength of the alternative predicates. In a mere compresence of two predications, the question of relative strength of the alternatives would not arise. Vacaspati refers to three possibilities from this point of view: either the affirmative predicate (p) is relatively stronger, or the negative predicate (~p) is the stronger one, or it may be that both the alternatives are equally strong.[14] In any case, doubt would involve an oscillation of the mind between the two alternatives: it is this which he has in mind when Vardhamāna so aptly characterises doubt as *dolāyitānekakotika*, i. e. as a knowledge where there is as it were an oscillation between the alternatives. I think, it is this state of the mind, this *dolāyitatva* that is an essential character of doubt and should be added to the structural analysis explained above, — unless of course it could be shown that such a character follows from the structure revealed in (4). I do not know however how this could be shown.

Distinction should nevertheless be drawn between doubt and question. Doubt is no doubt one of the sources of enquiry, though not all doubt is so. There are doubts that are not important enough and are just set aside and do not initiate any enquiry whatsoever.[15]

III

Having given an outline of the structural analysis of doubt given by the Naiyāyikas, we may now tnrn to certain ancillary issues concerning it. There is in the first place the question of classifying doubt into various types, and there is secondly the question regarding the causes of doubt. The Naiyāyikas have generally taken up these two issues together and have classified doubt according to its origination. The Naiyāyikas are not all agreed about any of these issues, and Gotama's *sūtra* on this has been subjected to conflicting interpretations. Vātsāyana, Uddyotakara and Vācaspati differ amongst themselves, not to speak of their differences from the Navya Naiyāyikas. It is difficult to evolve an agreed formula. I give below what seems to me to be an account which cuts across the divergences of opinion about the causes of doubt.

These causes may be divided into two groups: the general causes and the specific causes. By the general causes of doubt we mean those factors which must be present so that any doubt at all may occur. They are in other

words causes of doubt *qua* doubt. The specific causes are the causes only of specific kinds of doubt, and are not therefore to be regarded as causes of doubt *qua* doubt. If doubts are to be grouped in accordance with their origination, it is only these latter, namely the specific causes that are to be taken into consideration.

A. The general causes may be brought under two sub-heads, the positive and the negative.

(a) The positive general causes of doubt are two: (i) *dharmi-jñāna* and (ii) *viśeṣasmṛti*.

(i) In the first place, a doubt quâ doubt presupposes a knowledge of some sort of the *dharmi*, i e. the substantive of which the two mutually contradictory predicates are predicates. It should be obvious that this knowledge of the *dharmi* should be a *niścaya* i. e. a certainty, and cannot itself be a doubt, for otherwise the latter doubt would pre-suppose a further *dharmijñāna*, thus leading to an infinite regress. Consider the doubt 'Is this a man or not?' Here though the doubter is not sure-whether this is a man or not, he has a certain apprehension of the object here before him as a *this*, and may be along with some other generic characters. Gangeśa suggests two reasons why this factor should be regarded as an essential precondition of all doubt *qua* doubt. If *dharmijñāna* were not required for all doubts, there ought not to have been the rule that all doubts must have some substantive.[17] In fact, however, doubts are of the form K [{s} (p). {s} (~p)], and not of the form K [(p). (~p)]. Further, the property that in doubts one of the alternatives may be stronger than the other (*kotyutkatatva*) cannot be explained otherwise, for in the knowledge K [(p). (~p)], p and ~p should have no difference in status; any difference which they may have must be in their relation to the s which is being apprehended *as* s.

(ii) Mere *dharmijñāna* is not enough to produce a doubt. More-over mere knowledge of s as s does not explain why the doubt should have the predicates p and ~p, and not the predicates, let us say, q and ~q, We need therefore another positive, general condition, namely a remembrance of the two alternatives p and ~p. This is what is called *viśeṣasmṛti*, p and ~p being the *viśeṣas* or specific characters. It may also be called *kotismṛti* for they are also called the *kotis* or alternatives.

(b) The negative general condition necessary for all doubts *qua* doubt is non-perception of the specific characters as belonging to the substantive (*viśeṣa-adaśana*). Definite knowledge of the presence of any of the specific

characters in the substantive is a hindrance to doubt. If the supposed doubter knew for certain that s has p, or if he knows for certain that s has ~p, then the doubt 'Is s p or ~p?' would not obviously arise. Hence the absence of such specific knowledge is a necessary condition of all doubt *qua* doubt.[18]

B. While the conditions listed under A are necessary for there being any doubt at all. there are however other special causes of specific types of doubts. Thus doubts may be caused by either (a) perception of the common character (*samanadharmopapatti*), or (b) perception of an uncommon character (*anekadharmovapatti*) (c) hearing contradictory views expressed by parties opposed over an issue (*vipratipatti*), (d) reflection on the absence of any concommittance between *being experienced* and *being real* and between *not being experienced* and being unreal (*Uvalabhhi-anupalabdhi-avyavasthā*). Let us explain each one of these with suitable examples.

(a) A doubt of the form 'Is a p or not?' may arise from perception of some character common to both p and not-p (provided of course, it is accompanied by perception of s as s, non-perception of the specific characters p and not-p, and remembrance of those specific alternatives). By a common character is here meant any character or characters which are present where p-ness is present, but is also present where p-ness is not present, i.e. which may be accompanied either by p-ness or by not-p-ness. Seeing, something at a distanced s as a mere *this*), and perceiving its height, size, shape etc. which could very well belong to a man or to a dead tree trunk, one might doubt 'Is this a man or a dead tree trunk'?. If at this stage he could detect any of the specific properties which goes only with manhood, then his doubt would give place to the certainty 'This is a man.' Now it seems clear that in doubts arising from the perception of a common character in the above sense, the alternatives tend to be positive contraries instead of being logical contradictories, a point recognised by Vācaspati when he says that doubts of this kind are characterised by *vidhiprādhānya*.

(b) A doubt may arise also from the perception of an uncommon character. On perceiving some uncommon character in some substantive s, one may be haunted by the doubt what character it shares or has in common with others. The Naiyāyika's favourite example is this; if sound is known merely as possessing soundness (which is its distinguishing and in that sense an uncommon character) one may very well doubt if it over and

above this possesses eternality or non-eternality, for both are compatible with soundness:

The distinction between cases under (a) and those under (b) is apt to be overlooked. In the case (a), one perceives in s a character x which is common in the sense that it *as a matter of fact* accompanies and is consistent with both the alternatives. It accompanies p-ness as well as not-p-ness. In case (b), a character x is perceived in a s such that x belongs to s alone, and x is consistent with both, but not known to accompany either of, p-ness and not-p-ness.

(c) When in course of a disputation, the opposed and contrasting parties put forward their respective these, a hearer is very likely to be overcome by a doubt as to which of the theses is the correct one. The older Naiyāyikas take this as a special case of doubt, where the doubt is *śābda*, i. e. generated by hearing and understanding of the words uttered by the disputing parties. In such a case, of course, doubt arises not in the mind of the disputationists, for each of them is convinced of the correctness of his own contention, but in a neutral observer (*madhyastha*) who is confused by the mere statements of the contradictory positions advocated in the absence of any decisive supporting arguments. There must be absence, in other words, of *anyatarasādhakahetu*. Such doubt, once it has arisen, cannot be removed by the mere collective judgment (or, *sampratipatti*) of the form 'A holds p to be the case, and B holds not-p to be the case.'[19] What is necessary is the ascertainment which of the two is really the case.

Naiyāyikas are divided over the issue whether a doubt arising from this special cause is to be called *śābda* or *mānasa*. The question in other words is: does the doubt arise through hearing, or does it arise through the operation of mind (*manas*)? Raghunātha defends the former alternative and has the older authorities on his side.[20] Viswanātha argues in favour of the latter alternative, and makes use of the premise that *śabda* as a rule is a source of certainty so that by itself it cannot generate doubt.[21] What happens according to him is that the statements of the disputing parties give rise to remembrance of the alternatives. This latter knowledge, then, provided all the other required conditions are present, gives rise to doubt which therefore is *mānasa* and not *śābda*.

(d) Being an object of experience is not a sure mark of being real. Epistemological objecthood may or may not be accompanied by ontological independence. Both the real water and the water-in-the mirage are objects

of experience. Both the real snake and the illusory snake-in-the-rope are seen. Therefore from the mere fact that something is being experienced one cannot make sure as to whether the experienced something is also teal or not. There may therefore arise in such a case doubt about its reality or unreality.

Similarly, not being an object of experience is not a sure mark of unreality. The unreal of course may not be experienced. But so also frequently is the real. Not all that is real is experienced. Therefore, from the mere fact that something is not being experienced nothing can be ascertained as regards its reality or unreality. There may therefore arise in such a case doubt about the reality or unreality of what is not being experienced.

Attempts have been made to explain cases (d) in other ways. Consider the possibility (d'): Supposing I am having a knowledge which certainly possesses the generic character of experience-ness or *jñānatva*. This generic character however is consistent with, and is accompanied by, either of the two specific characters, the property of having a real object (*sadviṣayakatva*) and the property of having an unreal object (*asadviṣayakatva*). If we do not experience any of these specific characters in the knowledge under consideration there may be a doubt in accordance with rule (a).

However, there is a difference between (d) and (d'). In (d), the doubt concerns the object of the experience under consideration. The object being an epistemological object may or may not be ontologically real. In (d'), on the other hand, the doubt is about the knowledge or experience itself. Its being an experience may be either *sadviṣayaka* (true) or *asadviṣayaka* (false).

It has also been contended by others[22] that (d) is a special case of another rule (d"): doubt about the truth of a knowledge gives rise to doubt about the reality of the object of that knowledge (*prāmāṇyasaṃśayāt viṣayasaṃśayat*). Let K be a knowledge having O for its object. If for any reason I have a doubt of the form 'Is K true or not'?, this would generate a further doubt of the form 'Is O real or not'?.

There is again a nice point of difference between (d) and (d") In case of (d) what causes doubt about the reality or unreality of O is not a prior doubt in the truth of K but the perception of the generic character of O as an

object of knowledge, this character being consistent with both the reality and unreality of O.

The importance of the rule (d") —and one reason why it cannot be reduced to any other—is that though a prior certainty about an object (*arĭhaniścaya*) rules out the possibility of doubt about the same object, nevertheless such doubt may be caused by an intervening doubt in the truth of that initial certainty. The sequence in such cases may be set down thus:

1. Certainty, K, about O. 2. Doubt: Is K true? 3. Doubt: Is O real?

In the absence of (2), (3) cannot take place when (1) has already been there, the general rule being that though doubt does not obstruct certainty (for otherwise doubt would never be resolved), yet certainty does exclude doubt except in the case coming under (d").

(e) Another rule, which according to many comes under the *'ca'* of Gotama's sutra 1.1. 23, is to the effect that a doubt about the pervaded gives rise to a doubt about the pervader (*vyāpyasandehāt vyāpakasandeha*).[23] Smoke, for example, is pervaded (*vyāpya*) by fire which is the pervader (*vyāpaka*) in relation to it. Whereever there is smoke, there is fire. Smoke is never present in any locus of the absence of fire. If a person who knows this relationship between smoke and fire perceives smoke in a distant hill and recognises the smoke as the *vyāpya* of fire, he would naturally infer, and so arrive at a certainty that the hill also possesses fire. If however such a person, for whatever reason, comes to have the doubt whether what looks like smoke is really smoke or not, he whuld be led to the further doubt whether the hill possesses fire or not. Of course here as before in the case of inference, it is necessary that smoke should have been earlier known and in the present recognised to be a *vyāpya* of fire. It also holds good that certainty about the *vyāpya* of any one of the alternatives of a doubt would necessarily put an end to the doubt. Consider the doubt 'Is this a man or not'?. As soon as the doubter comes to perceive clearly such features as hands feet etc. in the object before him which is being referred to as *this*, his doubt would give place to the certainty 'This is a man', for the property of possessing limbs is a sure mark of manhood. Hence, the *viśeṣadarśana* or non-perception of specific characters— which is one of the general conditions of all doubt qua doubt—must be taken to include non-perception of the marks (or *vyāpyas*) of the specific characters.

IV

In this section we propose to examine Descarte's doubt with the help of the Nyāya theory outlined above. Such a confrontation, it is hoped, will help us to throw light on both the sides, and thereby on the nature of doubt *qua* doubt.

Descartes' doubt applies in the first instance to anything and everything in the world and also to any and every knowledge and experience. In his first *Meditation* and also in *The Principles of Philosophy, Part I* he gives us the grounds of his universal doubt. These grounds are the follhwing:

1. The senses are often found to mislead us. We cannot therefore place absolute confidence in them, for "it would be imprudent to trust too much to what has even once deceived us".[24]

2. Secondly, "in dreams we perpetually seem to perceive or imagine innumerable objects which have no existence".[25]

2a. There are, Descartes argues, "no certain marks by which the state of waking can ever be distinguished from sleep"[26], i. e. from the state of dreaming.

3. With regard to the supposedly self-evident truths of mathematics Descartes employs the following two arguments:

a. It is often found that men fall into error even in such matters, and regard as self-evident what is really false.[27]

b. More important for Descartes is this one: We believe that God who created us is all powerful. We do not however know for certain whether this all powerful God is not a deceiver. It may therefore be that he has created us with the will to deceive us. If on the other hand the creator is not all powerful then we shall be more imperfect and more likely to be under continual deception.

4. There is a final argument which, as would be clear from the remarks to follow is of the highest importance. We possess a free will and we are therefore free to withhold our assent from whatever is doubtful. In other words, we may suspend our belief in whatever is not "manifestly certain and undoubted".[28]

It seems clear that Descarte's arguments (1) and (2) come under the Nyāya rule (d), i. e. they are really based upon what the Nyāya calls *Upalabdhi-avyavasthā*. In this respect these two really constitute one

argument. They appeal to the fact that there is no fixed correlation between being an object of experience and being real. The unreal is as much an object of experience as the real. What is presented through the senses may then be unreal, just as what is presented in dream may be real. The doubt therefore may be accounted for by (i) perception (mentally) of the generic character of objectivity (*jñānaviṣayatva*) and (ii) uncertainty as to reality or unreality, arising out of the absence of any settled order in such matters.

The argument (2a) however presents great difficulty. What is necessary for the possibility of a doubt of the form 'Am I awake or am I dreaming?' (= 'Is this a dream or is it a waking experience?') is that I should perceive the generic character of experience-ness (*jñānatva*), and yet fail to perceive either of the two specific characters (which in the present case are the property of being a dream and the property of being a waking experience) or their respective marks. The possibility is *a priori* implied therein that there are such marks, and that it is possible to distinguish between the two specific characters, though in any given case one may fail to do so. Descartes however contends that there are "no certain marks" by which one may be distinguished from the other. If two properties p and q cannot at all be distinguished, i. e no sure mark exists which could serve the purpose, then there is no question of the non-perception of such marks, and hence no possibility of doubt with regard to them. If on the other hand there are such marks though Descartes fails to adduce any then his doubt cannot claim universality. He could then only say that he could not then and there distinguish the one from the other. Moreover, if no sure mark of dream experience were known to him on what ground could he almost persuade himself to think that he was then dreaming?[29] The point is that a doubt of the form 'Is S p or q?' requires both that p and q are distinct with their respective distinguishing marks and that in a given case there is a non-perception of them. These two conditions defeat the possibility of a universal scepticism.

The argument (3a) is formally of the same type as the first argument and is to the effect that where there is the least chance of error, where in other words there is no *upalabdhivyavasthā*. i. e. no rule that only the real is experienced, one may reasonably doubt. This applies as much to sense-perception as to mathematics. And incidentally it may be pointed out that the argument applied to mathematical truths is close to the point of view of the Nyāya logic which does not admit the distinctions between analytic, and

synthetic, *a priori* and *a posteriori*, self-evident and not-self-evident truths. The subjective possibiliry of error being always there, there may be doubt regarding the truth of any nowledge whatsower as also a resulting doubt about the reality of the object of such knowledge.

However none of the arguments 1–3, though sanctioned by the Nyāya rules, can be used for the purpose of justifying a universal scepticism. For, among the necessary conditions of douct quâ doubt there is at least one which constitutes a certainty: this is the *dharmijñāna* or knowledge of the substantive. In any particular doubt there must be certainty about the *dharmi*. Basing on the facts of error, we may have two kinds of doubt: the one of the same sort as 'Is this a rope or a snake?' another of the philosophical kind: 'Is sense-perception valid or not?' or 'Is the world real or imagined?'. It is easy to show that doubts of the second kind are self-stu'tifying, for they question the very reality of their own respective *dharmis* which they cannot consistently do.

Two other arguments of Descrates remain to be examined. The doubt involved in 3(b) may be restated thus:

'Is God who is known to be all-powerful also a deceiver or not?. The doubt so formulated seems to be sanctioned by the Nyāya rule B(b). Here we have an uncommon character belonging to the *dharmi* i. e. being both the creator of the world and all-powerful, and we are left in doubf as to which of the two properties 'being a deceiver' and 'being veracious'—both compatible with the above uncommon character—further belongs to it. Such a doubt, if it comes to happen, would no doubt have a limitless scope with regard to the truth of *all* our experience. It would not however apply to our belief in the fact that there is an all-powerful creator. The argument is to that extent effective, but looses its force because of the fact that its starting point is a theological belief from which a reflective philosopher may not start.

Descertes' *Cogito* which sets a limit to his doubt may be interpreted as the ultimate *dharmi*, certainty about which is presupposed in any doubt. But it should be pointed out that the 'I' is the *dharmi* only in the reflective judgements of the form 'I know'. 'I perceive' etc., but not in the unreflective judgments of the form 'This wall is white', 'The yonder bird is a crow' etc., Doubts being of the form 'Is this wall white or not?', 'Is the yonder bird crow or not?' do not presuppose certainty about the 'l' as their *dharmi*. In case however these doubts come to occur through the reflective

Umweg of doubts in the validity of the respective knowledges (as per rule α^n), then of course certainty about the 'I' would be presupposed, for the 'I' is the *dharmi* in the latter doubts that have the form 'Did I know rightly or not?' If Descartes' doubt is to justify certainty about the *Cogito*, then he must be interpreted as having taken to this reflective *Umweg* of having first doubted the *prāmāṇya* of our beliefs, and then arrived at the doubt about the reality of the objects of those beliefs. Such an interpretation is amply borne out by Descartes' writings.

One of the chief grounds sustaining Descartes' universal scepticism lies hidden in the last of his arguments. The human will, he writes, is free and so is also free to withhold its assent from whatever is doubtful. It must readily be seen that this argument represents a type of thinking foreign to the Nyāya, and in fact to all Indian philosophy. Withholding assent or doubting as a function of the limitless freedom of the will is not recognised as a possibility in the Nyāya, and therefore the argument (4) does not conform to any of the Nyāya rules. And yet if anywhere it is here that we shall find the sources of a truly *philosophical* doubt.

With a view to looking closer into the nature of this argument let us ask, what is meant by the two expressions "withholding ones assent" and "whatever is doubtful"?

Withholding ones assent means a deliberate, reflective decision not to believe, to suspend or neutralise ones belief, to "bracket" it as Husserl would say. The motive for doing this—with Descartes, and also with Husserl—is the reflective one of finding a secure basis for human knowledge, a radical foundation, a first principle for the sciences. The Nyāya is operating with a strictly causal-deterministic conception, and within such a framework a doubt could occur only when there are necessary and sufficient conditions for it. The Naiyāyika might seek to include this reflective doubt within his own deterministic framework by tracing it to the factor of *icchā* which is recognised by him to overpower others. But I wonder if this would help us to overcome the great difference that subsists between the two conceptions, which may perhaps be brought to light in still another way.

Withholding ones' assent to a belief does not exclude making practical use of that belief. Descartes and Husserl, just when they ask us to doubt, or to practise the *epochè*, do not suggest that that would mean giving up and

reorientation of our practical behaviour, of our *Lebenswelt* based precisely on those beliefs. On the contrary, Descartes writes:

"…we ought not meanwhile to make use of doubt in the conduct of life." (*The Principles of Philosophy*, part I. III.)

And Husserl says the same of his phenomenological *epochè*: the *epochê* will not affect the daily course of practical life; it will only suspend theoretical judgment about the 'being' of the world.

What is excluded is the possibility of making any theoretical use of the beliefs concerned, I wonder if the Naiyāyika would approve of this attitude. For him, though ascertainment of the truth of a belief (*prāmāṇyāgraha*) is not necessary for the appropriate practical behaviour, yet non-apprehension of its falsity is certainly a necessary condition.[31] Now, on the Nyāya analysis, doubt in the truth of a knowledge has the form:

K [{this knowledge} (truth) {This knowledge} (falsity)]. In so far as this doubt has falsity as one of its *prakāras*, the doubt is an apprehension of falsity in the belief, and therefore on the Nyāya rules would serve as a *pratibandhaka* to the appropriate practical behaviour. Normal practical behaviour would therefore be impeded by a universal scepticism. Descartes and Husserl do not apprehend this possibility but on the other hand assure us that their doubt would leave the practical *Lebenswelt* untouched. There must then subsist a radical difference between the two doubts. They must then be not merely different kinds of doubts, but *as doubts* different.

The same radical difference comes to light if we examine what Descartes means by 'whatever is doubtful'. In one meaning of it, a thing is doubtful if it is in fact an object of doubt. But, for one, this is not all that is there in the ordinary meaning of that expression; and, for another, if to be doubtful meant to be *in fact* an object of doubt, then Descartes' decision to withhold assent from what is doubtful would be trivial; he would then be asking us to dobut what is being doubted, which would be utterly pointless. To be doubtful then means to be a *possible* object of a doubt. Now on the theory nothing possesses any property or properties which make it liable to be doubted. Nothing by itself, i. e. by virtue of any its properties, is *doubtful*. Everything at the same time is a possible object of a valid knowledge, i. e. a *prameya*. Suitable *epistemic* conditions may however produce in a person doubt about anything. For Descartes, and for the entire tradition of Western philosophy there is an important sense in which a thing may meaningfully be called doubtful. This is the sense that the thing *could have been*

otherwise, that its contradictory is possible, or that it is, though a fact, a contingent one, contingency of p being defined (in 'Lukasciewiz' symbolism) as KCp CNp. If there is any p of which this holds good then it is doubtful. It is not necessary. It is, as Descartes says, uncertain. From all such things we are entitled to withhold our assent.

It would be obvious that the Nyāya knows no such categorisation of things or facts or propositions into contingent and necessary. It knows, as said before, no distinction between what is in fact true but might not have been, and what is necessarily true, between the *a posteriori* and the *a priori*, or even between analytic and synthetic truths. Bare logical possibility or counterfactual conditionals do not interest it. It gives a logic of facts, and *in this sense* is extensional, avoiding modal concepts[32] It would hot therefore approve of a universal scepticism, based on the notion of logical possibility.

Should we then say that here is an overall limitation of the Nyāya logic, whose symptoms show themselves in all aspects of it far beyond the narrow subject matter of the present paper? Perhaps it is so. It may also well be the case that doubt (or *samśaya*) in one sense is exactly what the Nyāya means by it, and for it the Nyāya logic is well adapted. At the same time, philosophical doubt, doubt in the reflective level, falls beyond its scope. And the two doubts, it may well be, are not only different kinds of doubts but are *as doubts* different. One and the same logic cannot do justice to both. Descartes may be said to have erred on the opposite side, when he sought to extend the logic of ordinary doubt to philosophical doubt, which is the same as using arguments (1)—(3) to justify the latter.

---

1 in the sense e. g. in which Vātsāyana defines *Nyāya* as *Pratyakṣāgamāšriitamanumānam* (Bhāṣya on Nyāya Sūtra 1.1.1.)

2 What is more, the Nyāya goes to the extent of holding that a formally invalid inference is even psychologically impossible, the socalled *hetvābhāsas* being, not errors in inference, but conditions which render an inference psychologically as well as logically impossible.

3 Memory also is *apramā*, but not in the sense in which doubt or error is so.

4 For a more detailed account of this and the allied concepts see my *Nature of the Prāmānya Theory* II, Our Heritage, Bulletin of the Department of Post-graduate Training and Research, Sanskrit College, Calentta, Vol. VIII. Part I, pp. 85–52.

5 Further elaborations of these concepts, howsoever necessary, would take us beyond the scope of the present paper. See reference given under footnote 4. Be it noted here, to avoid any further misunder standing, that the epistemic distinction between *vikeṣyatā* and *prakāratā* does not correspond to the ontological distinction between substance and attribute. Nor is it the same as the logical distinction between subject (*uddeśya*) and predicate (*vidheya*).

6 "tadabhāvārakārakam tatprakārakamjňanam (*Muktāvali* on Kārikā 129)

7 *"Vākārathaśa virodha"* (*Kiraṇāvaliprakāśaḥ (Guṇa)*). The Princess of Wales Saraswati Bhavana Texts Series, p. 135.

12 Hence Gadādhara's rather forbidding definition: *"svāvacchinnaprativadhyatā-nirūpitaprativandhakatva-svasamānāhikaraṇyvbhayasambandhena viṣayatāviśiṣṭabiṣaya-tāsālijñānam samśaypadārthaḥ"*. (Prāmāṇyavāda Gādādhari).

13 "Viruddhobhayāropasāmagridvayasamājādubhyāropa eka eva bhavati sa eva samśsayaḥ" (Prāmāṇyavāda, Darbhangā edition, p. 91).

14 *ibid.*, p. 92.

15 Vardhamāna — Kiraṇāvaliguṇaprakāśa, p. 130.

16 Vardhamāna — "Ka ca jijnāsājanakam jnanam samśayaḥ upekṣaṇlyasamsayāvyāpteḥ" (*ibid.*, p. 133).

17 Dharmijñānam ca samśayahetuḥ, anyathā samśaye dharminiyamḥ kotyutkatatsam ca na syāt" (*loc cit.*, p 92).

18 It may be mentioned that both the factors (a) (ii) and (b) are implied in Gotama's sūtra where doubt is characterised as being *viśeṣāpekṣa*, which may mean either *viśeṣādarśana* (apekṣā = *adarśana* or   corresponping to the above two factors respectively. There is a third possible interpretation according to which this expression means "the desire to apprehend the specific characters" (*apekṣā= ākānkṣā* or desire): but we cannot include such desire amorgst the necessary pre conditions of doubt qua doubt. There may be doubts even when such desire is absent. Moreover often the desire to ascertain is a consequence rather than a cause of doubt.

Series Preface

No anthologist succeeds in including everyone's favorites, so a few words about the principles of selection seem appropriate. Firstly, as with other volumes in this Garland series, priority has been given to journal articles, rather than book chapters. However, some essential book chapters have been included, and the introductions to each volume include references to significant books. Readers in search of further bibliographical assistance should consult what is now the standard source: Karl H. Potter, *Bibliography of Indian Philosophies*, 3rd rev. ed. (Delhi: Motilal Banarsidass, 1995), and the on-line updates to it available at the "Indian Philosophy Bibliography" (http://faculty.washington.edu/kpotter/). Secondly, the emphasis throughout is on *philosophical* studies of Indian philosophy. Consequently, much excellent historical and philological work has been omitted. Thirdly, the desire to make Indian philosophy accessible to interested Western philosophers has meant not only that all the selections are in English, but also that most of them use a minimal amount of unglossed Sanskrit terminology. This restriction has prevented the inclusion of more work by Indian authors.

Finally, I would like to acnowledge gratefully all the good advice and generous assistance I have received from Chakravarthi Ram-Prasad, Mark Siderits, and (most especially) Stephen Phillips. The blame for any shortcomings that may remain rests, of course, solely upon my own shoulders.

Series Introduction

The five volumes of this series collect together some of the most significant modern contributions to the study of Indian philosophy. Indian philosophy is one of the great philosophical traditions of the world. Unfortunately, however, its philosophical riches are not always as readily accessible to Western philosophers as might be desired. The selections in these volumes help to redress this situation by giving readers easy access to some of the best philosophical work in the area, including material that is often difficult to locate.

Collectively the selections in these volumes explore many of the important commonalities and differences between the Indian and Western philosophical traditions. These similarities and differences are philosophically pregnant. There is enough in common between Indian and Western philosophy to suggest that the philosophers in both traditions are often engaged with similar problems and hence should be able to communicate with each other. However, there are also sufficient differences between the traditions to suggest that they may have some novel perspectives to offer each other.

In choosing the selections for this series priority has been given to journal articles, rather than book chapters. However, some essential book chapters have been included, and the introductions to each volume include references to significant books. The emphasis throughout is on *philosophical* studies of Indian philosophy. The desire to make Indian philosophy accessible to interested Western philosophers has meant not only that all the selections are in English, but also that most of them use a minimal amount of unglossed Sanskrit terminology.

Volume 1: Epistemology is concerned with the nature and scope of Indian *pramāṇa* theory, i.e. that part of Indian philosophy concerned with the nature and sources of knowledge. Indian philosophers developed a causal theory of knowledge and acknowledged the existence of a number of valid ways of knowing, including perception, inference and testimony. The Indian *pramāṇa* theorists thus discussed many issues that have also occupied Western epistemologists, often offering importantly different perspectives on these matters. They also sometimes addressed various interesting questions about knowledge that are unfamiliar to Western epistemologists.

The selections in this volume discuss Indian treatments of epistemological topics like the means of knowledge, realism and anti-realism, truth, knowledge of knowledge, illusion and perceptual error, knowability, testimony, scepticism and doubt.

Volume 2: Logic and Philosophy of Language is concerned with those parts of Indian *pramå~a* theory that Western philosophers would count as logic and philosophy of language. Indian philosophers and linguists were much concerned with philosophical issues to do with language, especially with theories of meaning, while the Indian logicians developed both a formalised canonical inference schema and a theory of fallacies. The logic of the standard Indian inferential model is deductive, but the premises are arrived at inductively. The later Navya-Nyåya logicians went on to develop too a powerful technical language, an intentional logic of cognitions, which became the language of all serious discourse in India.

The selections in this volume discuss Indian treatments of topics in logic and the philosophy of language like the nature of inference, negation, necessity, counterfactual reasoning, many-valued logics, theory of meaning, reference and existence, compositionality and contextualism, the sense-reference distinction, and the nature of the signification relation.

Volume 3: Metaphysics is concerned with the complement to *pramå~a* theory, i.e. *prameya* theory. Whereas the *pramå~as* are the means of knowledge, the *prameyas* are the knowables, cognisable entities that constitute the world. With respect to the number and kinds of such entities, there was a very wide variety of opinion among classical Indian

philosophers — including variants of monism, dualism and pluralism about both entities and kinds. Many metaphysical topics were debated, but two of the most important were causation and the nature of the self. The competing theories offered about these two issues also raised other questions about the metaphysics of wholes and parts, substances and properties, and universals and particulars.

The selections in this volume discuss Indian treatments of topics in metaphysics like ontology, constructionalism, universals, negative facts, mereology, causation, relations, freedom and determinism, and theories of the self.

Volume 4: Philosophy of Religion is concerned with something that can be described as "Indian philosophy of religion," i.e. "philosophy of Indian religions." Contrary to popular Western belief, classical Indian philosophy was not indistinguishable from Indian religion — as even a cursory glance at the first three volumes of this series will demonstrate. Religious concerns, though, did motivate the work of many Indian philosophers. However, important differences between the major Western religions and the major Indian religions (Hinduism, Buddhism, Jainism) mean that the shape of Indian philosophy of religion is often significantly different from that of Western philosophy of religion.

The selections in this volume discuss Indian treatments of topics in the philosophy of religion like the problem of evil, God, theological monism and dualism, atheism, the concept of a perfect being, reason and revelation, rebirth and karma, religious language, religion and politics, ritual and *mantra*, and the religious determinants of metaphysics.

Volume 5: Theory of Value is concerned with Indian discussions in the areas of ethics, politics and aesthetics. The Indian philosophers had a good deal to say about the theory of value as they vigorously discussed topics like the ends of life and the relation of virtuous action to those ends. A traditional Hindu classification recognises four classes of values: *dharma* (morality, virtue), *artha* (wealth, power), *kāma* (pleasure), and *mokṣa* (liberation). *Mokṣa* is usually held to be the highest value and is extensively discussed in the paradigm Indian philosophical texts. Indian political and

legal theory is concerned with the values of *artha* and *dharma.* Aesthetic pleasure is one of the subject matters of a developed body of writing on aesthetic theory. *Rasa* ("flavor"), the special feeling or enjoyment that pervades an artwork or is aroused in its contemplator, is commonly seen as detached from the aims and concerns of ordinary life, with some even suggesting that it provides a foretaste of the bliss of *mokṣa.*

The selections in this volume discuss Indian treatments of topics in the theory of value like the proper ends of life, the relation of *dharma* and *mokṣa,* liberation and pleasure, the sources of our knowledge of right and wrong, the ethics of non-violence, the status of the supra-moral, egoism and altruism, the theory of *rasa*, aesthetic experience and catharsis.

Volume Introduction

Classical Indian *pramāṇa* theory includes not only what Western philosophers would count as epistemology, but also much that they would count as logic and philosophy of language. This is because almost all Indian philosophers recognized inference *(anumāna)* as an independent source of knowledge, and many Indian philosophers recognized testimony (*śabda*) as a special kind of word-generated knowledge.

The history of Indian logic can be roughly divided into three periods (Vidyabhusana 1978): the ancient period (650 BCE-100 CE), dominated by the *Nyāyasūtra* and its commentaries; the medieval period (up to 1200 CE), dominated by the Buddhist logicians Dignāga and Dharmakīrti; and the modern period (from 900 CE), dominated by Gaṅgeśa and the school of Navya-Nyāya, or "New Logic". Since the origins of Indian logic were in the ancient traditions of public debate (Matilal 1985, 1998), there are accordingly two distinct, though intertwined, parts to its development. One part (on which there is a very large literature) is to do with the search for a satisfactory model of inference and the consequent emergence of a formalized canonical inference schema. The other part is more to do with dialectics (Solomon 1976), and includes a concern with the nature of fallacies *(hetvābhāsa)*. Both parts are evident in Gautama's *Nyāyasūtra* (second century CE), the foundational text for the development of ancient Indian logic.

Gautama identifies and systematizes a form of inferential argument used in debate (Potter 1977, Chakrabarti 1977). He defines an inference as having five parts: the proposition (*pratijñā*); the ground or reason (*hetu*); the

corroboration (*dṛṣṭanta*); the application (upanaya); and the conclusion (nigamana). The stock example is:

> Proposition (*pratijñā*): The mountain has fire.
> Ground or reason (*hetu*): Because it has smoke.
> Corroboration (*dṛṣṭanta*): Whatever has smoke has fire, like a kitchen.
> Application (*upanaya*): This mountain has smoke.
> Conclusion (*nigamana*): Therefore this mountain has fire.

The Buddhists and others argued that this schema includes redundant elements, but over the centuries Nyāya steadfastly insisted that all five parts are necessary for an argument used to convince others. The logic is deductive, but the premises are arrived at inductively. Crucial to this schema (which some scholars have called the Indian "syllogism") is the notion of the inference-warranting pervasion relation (*vyāpti*) appealed to in the third premise. Naiyāyikas are fallibilists about our knowledge of pervasions and hence inferential reasoning is defeasible, i.e. reasoning based on an assumption of a *vyāpti* can in principle be defeated.

The *Nyāyasūtra* also contains a list of five classes of fallacious reasons (*hetvābhāsa*), all of which fail to possess all the characteristics of the true reason (*hetu),* plus warnings about various kinds of debating tricks. The classes of five fallacies were elaborated upon by later commentators (Saha 1987), but as Indian logic developed much more attention was given to the formalization of the canonical inference.

Medieval Indian logic was dominated by the Buddhist logicians Dignāga and Dharmakīrti, though there were also important contributions made by the Jainas. Dignāga (5th century) built upon and systematized earlier Buddhist work in logic, setting out the framework within which later Buddhist thinkers addressed questions of inference and debate (Chi 1984, Matilal and Evans 1986, Hayes 1988, Matilal 1998). The Buddhist formalization of the standard inference schema is simpler than the Nyāya version:

Thesis (*pakṣa): p* has *S.*
Reason (*hetu): p* has *H.*
Pervasion (*vyāpti*): Whatever has *H* has *S.*

(Where *p* is the *pakṣa* or subject of the inference, *S* is the *sādhya* or property that qualifies *p*, and *H* is the *hetu* or that other property which is related in an appropriate way to *S*.)

Dignāga made three major contributions. First, he centered his account of inference around the distinction between inference for oneself (*svārthānumāna*) and inference for others (*parārthānumāna*). Second, he more precisely formalized the requirement that the *hetu* of a satisfactory inference must satisfy three conditions (*trairūpyahetu*): (i) it should occur in the case under consideration; (ii) it should be present in a similar case; and (iii) it should not be present in any dissimilar case. Pervasion is then defined in terms of the last two of these three conditions. Third, he devised his "wheel of reasons" (*hetucakra*), a matrix to classify pseudo-reasons in terms of the last two forms of the *trairūpyahetu.*

Dharmakīrti (7th century) built upon Dignāga's work, introducing two particularly important innovations (Stcherbatsky 1962, Matilal and Evans 1986, Hayes and Gillon 1991, Matilal 1998). First, he claimed that there is a kind of necessity to the *vyāpti* relation, a necessity that is grounded either in causation or in identity. Second, he brought within the scope of inference knowledge of absences, or negative facts.

The modern period of Indian logic is the period of Navya-Nyāya (Ingalls 1951, Geokoop 1967, Matilal 1968, Guha 1979, Potter and Bhattacharyya 1992, Wada 1990, Phillips 1995, Matilal 1998). The most influential work of this school is certainly Gaṅgeśa's prodigious *Tattvacintāmaṇi* (14th century). The next most eminent Navya-Naiyāyika is Raghunātha Śiromaṇi (16th century), who further refined the analytical tools of Navya-Nyāya and introduced a number of ontological innovations. The Navya-Nyāya philosophers developed a powerful technical language which became the language of all serious discourse, an intentional logic of cognitions (*jñāna*)

increasingly construed by most Indian philosophers as being independent of the realist metaphysics of Nyāya-Vaiśeṣika.

Indian philosophical concerns with language were very much connected with the early development of Sanskrit linguistics (Staal 1988, Bronkhorst 1986, Matilal 1990, Coward and Raja 1990). Indeed, the Sanskrit grammar of Pāṇini (c.350 BCE) became a paradigm for Indian philosophers in a way comparable to the way Euclid became one for Western philosophers. Accordingly some of the concerns of classical Indian philosophy of language are closely wedded to the peculiarities of the Sanskrit language. But Indian philosophers (and linguists) also concerned themselves with more general issues, particularly theories of meaning (Raja 1969, Deshpande 1992, Houben 1997, Ganeri 1999). The very different metaphysical commitments of the different Indian philosophers meant that they espoused a wide range of views on topics like reference and existence, the relations between word meaning and sentence meaning, literal and metaphorical meaning, and the nature of the signification relation.

The selections in this volume begin with a useful introduction to Indian logic by Hamblin, emphasizing its original twofold nature as a theory of fallacies as well as a theory of inference. The earliest Western scholars of Indian logic, however, were much more concerned with the Indian ”syllogism”, often misattributing its development to an early Greek influence. The piece by Randle tries to present the Indian inference schema in a broadly ”syllogistic” fashion, though Randle is also careful to note various important differences between Indian and Western logic and the limitations of the syllogistic parallels. Staal's article on the concept of *pakṣa* in Indian logic emphasizes how misleading it can be to conflate the *pakṣa* of an Indian inference with the minor term in a Western syllogism and stresses that in Indian logic an entity is never regarded in isolation, but always as occurring in a locus. Staal's succeeding article clearly demonstrates that the law of contradiction was widely accepted by Indian philosophers. He also discusses two types of negation recognized and analyzed in Mīmāṃsā in connection with the logic of injunctions.

The article by Gillon and Love presents Buddhist logic through a detailed analysis of the structure of argumentation illustrated and sometimes described in a sixth century manual, Śaṅkarasvāmin's *Nyāyapraveśa*. Gillon and Love thereby attempt both to exhibit a new approach to Indian logic and to provide a rudimentary exposition of it, conceiving of their task as analogous to a linguist's articulation of the structure of a language of which she is not a native speaker. The result is a multi-levelled account which utilizes analytical tools drawn from mathematical logic, linguistics and game theory.

The rich tradition of Navya-Nyāya is represented here by two selections. Bhattacharyya's article on the technical language of Navya-Nyāya provides detailed accounts of some of the key notions in terms of which all cognized structures are to be analyzed and rigorously described (see also Bhattacharyya 1987). One of the special features of Navya-Nyāya is their complex account of four types of negation (Matilal 1968), and the article by Shaw is a detailed discussion of the corresponding sixteen types of double negation recognized in their system.

The controversial question of what sort of necessity the Indian logicians implicitly recognized is addressed by the next three selections. Indian inferences rest on an inductive general premise (the *vyāpti*) and the Western notions of formal validity and logical necessity do not seem to be present in Indian logic. Some scholars have suggested that the Indian recognition of logical principles like the laws of contradiction and excluded middle is evidence for the presence of the concept of logical truths or necessity (Matilal 1982). Sibajiban's paper takes a different tack, arguing in effect that we can find in Indian logic the notion of an inference schema whose instances would all be valid inferences. Just as the knowledge of the specific nature of the middle term is unnecessary for a Western syllogistic inference, so too is the specificity of the *hetu* unnecessary for an Indian inference. All we need is a term with which the *sādhya* ("major term") is invariably copresent. But then we have either an a priori inference rule, or a purely formal schema whose every substitution instance is a valid schema.

Mohanty favors a different approach to the matter, reminding us that Indian logic is a logic of cognitions (*jñāna*), not of propositions. Hence it is not concerned with the compatibility or incompatibility of propositions, but rather with the compatibility or incompatibility of awareness episodes in virtue of their contents (see also Mohanty 1992). This explains the Indians' lack of interest in purely formal necessities. What the Indian logicians offer us instead is a challenging theory of inference that is both a logic and a psychology of inference, without being psychologistic in any pejorative sense.

Yet another approach is to find evidence for an Indian sensitivity to logical possibility and logical necessity in their use of *tarka,* a concept discussed in Davis' article. *Tarka* in Indian logic is a subjunctive conditional of the form *"lip,* then *q",* where *p* and *q* are both false (Bagchi 1953, Chakrabarti 1992). Such conditionals are frequently utilized by Indian philosophers in *reductio*-type arguments. But for the implicit *modus tollens* to work, the Indians presumably required too some conception of a connection between two unrealized (logical) possibilities.

Something of the Jaina tradition of logic is introduced by Matilal's piece on *anekānta* (see also Matilal 1981). The Jaina logicians made many important contributions to the development of Indian logic, especially during the medieval period. Their most famous logical doctrine is the sevenfold predication (*sapta-bhaṅgī*), according to which no predicates can be absolutely true of an object. This in turn reflects their metaphysical relativism (*anekānta* or *syāvāda),* which the Jainas staunchly defended against charges of irrationality and incoherence.

An excellent overview of Indian concerns with language is provided by Staal's wide-ranging survey, which discusses the contributions of both grammarians and philosophers. Brough's seminal article discusses the details of some Indian theories of meaning, including competing views about the relation of word meaning and sentence meaning, and about literal and metaphorical meaning (see also Raja 1969, Murti 1974).

Matilal's piece on reference and existence introduces an important debate between Nyāya and the Buddhists about the "riddle of non-being"

(Siderits 1991, Chakrabarti 1997). The Nyāya realists treat sentences involving empty referring terms as complex, and their simple parts as standing for real elements. Sentences like "The rabbit horn does not exist", which apparently refer to non-existent entities, are translated into sentences like "There is no relation between the rabbit and a horn", which refer only to entities that are reals according to Nyāya metaphysics. The Buddhists, committed to the momentariness of all existents, favor instead a "pan-fictional" approach which allows that the unreal entities of non-referring expressions can also be the objects of cognitions.

The article by Matilal and Sen intriguingly connects some Indian debates about the relations between word meaning and sentence meaning with some modern Western debates about contextualism, compositionality and meaning (see also Siderits 1991, Mohanty 1992). They argue that some of the philosophical issues raised by Frege's context principle were similar to the issues raised by the controversy between the Bhāṭṭa and Prābhākara Mimāṃsakas about how we grasp the meaning of a sentence.

Siderits' paper on the sense-reference distinction in Indian philosophy of language begins from the received opinion that the Indians did not posit sense as a component of the meaning of an expression in addition to reference. However, Siderits goes on to argue that their commitment to semantic realism forces upon philosophers as different as Dharmakīrti and the Prābhākaras a recognition of something sense-like, and that from them we learn something important about the motivation for the sense-reference distinction.

The Herzbergers' paper discusses some themes in the Grammarian philosopher Bhartṛhari (Houben 1995). "Bhartṛhari's Paradox" is generated by the problem of how to state the unnameability thesis (i.e. the thesis that there are some things which are unnameable). The paradox is that any positive instance of the thesis that might be offered as verifying it seems to involve naming what is declared to be unnameable. The Herzbergers offer some arguments of their own for the unnameability thesis, but each of these arguments also turns out to paradoxically undercut its own conclusion. If we accept that no relation can be one of its own relata, then not only is the

inherence relation unnameable, but the significance relation is unsignifiable and the denoting relation undenotable.

The Indian Tradition

Despite large and obvious differences, the history of Indian Logic runs curiously parallel with that of the Logic of Europe, at least in its classical and medieval periods; so much so that one is tempted to see the two as advancing side by side, rather than separately. So far as the classical period is concerned we may, in fact, have tended to underestimate the extent of the contact between India and Greece; for though no one now maintains, as some historians have argued,[1] that Indian Logic was directly inspired by Aristotle, or even that influences in either direction can be definitely traced, it is known that there was considerable commerce between the two regions. Aristotle's most famous pupil Alexander had, after all, penetrated to India in the course of his military ventures, though it is doubtful that he found time to lecture the inhabitants on Logic. There were subsequently Greek settlements on the north-west frontier, and it would be surprising if there were not some interpenetration of ideas. Later, with the rise of Mohammedanism, these ties were broken, and India and Europe were held apart by a civilization largely hostile to both. The Arabs, it is true, helped to preserve the European tradition to some extent by taking over Aristotle's works in translation; but they did not themselves discover the Indian Logic and, in fact, the Moslem invasion of India nearly caused its extinction. Many of our modern Sanskrit texts are re-translations from versions that survived in Tibet. We can also study such doctrines as went with Buddhism to China.

The actual authors of the earliest Indian treatises are dim, shadowy figures and it is difficult to date their works even approximately. The most important text, the *Nyāya sūtra* (to a sufficient approximation the name means just 'Logic Book'), was supposedly written by one Gautama or Akśapeda (two persons or one?) at some time during the first three centuries

A.D.; but it could be a compilation, and one part of it, the fifth book, which will occupy us later, has some parallel in the work of the physician Caraka, who is placed about A.D. 70. It is quite short – about 12,000 words altogether in English translation – and aphoristic in style, to the extent that it needs to be accompanied by a detailed commentary. A commentary by Vātsyāyana (5 th–6th century ?), author also of the *Kama sūtra*, is very often printed with it.[1]

Before considering what Gautama and Vātsyāyana say about Fallacies it is necessary to sketch their theory of inference. This betrays a 'dialectical' origin almost as strongly as Aristotle's *Topics*. A single pattern of inference is given, without moods or figures. An inference has five members. Illustrated by the stock example of later writers, they are:

(1) (Thesis): 'The hill is fiery.'
(2) (Reason): 'Because it has smoke.'
(3) (Example): 'Whatever is smoky is fiery, like a kitchen.'
(4) (Application): 'And this hill is smoky.'
(5) (Conclusion): 'Therefore it is fiery.'

Since Gautama calls (3) just 'Example', it seems likely that, in the illustration, the statement of a general rule, 'Whatever is smoky is fiery', is a later importation: the original idea is simply that an example of the operation of the (unstated) connection between the major term 'fire' and middle term 'smoke' should be given. If this seems strange, comparison with Aristotle *Rhetoric* (1393a 22–1394a 18) might be helpful. In general the aim of this theory of inference is much closer to Aristotle's aim in his *Rhetoric* than it is to what we are used to and which derives from the *Prior Analytics*. Gautama defines an 'example' as a 'case in which the common man and the expert agree': in this case there is some resemblance to Aristotle's definition of dialectical or examination arguments.[1]

The apparently useless repetitive character of (4) and (5) led to their being dropped by some later writers. Their presence is less surprising, however, if the whole inference scheme is seen as a *pro forma* for the

setting-out of inferences in practice, with an aim of securing comprehension in an audience or persuasion of an opponent. Here it is interesting that we are told by Vātsyāyana in his commentary that others raised the number of members of the syllogism to ten, by adding the 'desire to know', 'doubt', 'belief in possibility of solution', 'purpose in view in attaining the conclusion' and 'removal of doubt'. If these are interleaved with the other five we have the pattern of a veritable dialogue, in which the added members represent the reactions or contributions of a second participant. We could dramatize the situation something as follows:

A The hill is fiery. (*Thesis*)

B Why ? (*Desire to know*)

A Because it is smoky. (*Reason*)

B Does that follow ? (*Doubt*)

A As in the case of a kitchen. (*Example*)

B Oh, I begin to see! (*Belief in possibility of a solution*)

A And, you see, this hill is smoky. (*Application*)

B Now we are getting somewhere. (*Purpose in view in attaining the conclusion*)

A So the hill is fiery. (*Conclusion*)

B Of course! (*Removal of doubt*).

The scheme is artificial at some points, as witness the vapidity of the remarks I have had to write in for the second speaker. However, there can now be little doubt that Gautama's scheme is aimed at representing the *presentation of an argument to others*; that is, at Rhetoric or Dialectic, not pure Logic.

A number of writers from the fifth and sixth centuries made a distinction between *svārtha*, 'inference for oneself', and *parārtha*, 'inference

for others', the former being possibly non-verbal. The distinction passed into the Indian logical tradition, which only much later, and then incompletely, developed a 'pure' Logic with a detachment from practical application, of the kind that has been dominant in the West.

The apparently repetitive character of the fourth and fifth members of Gautama's syllogism has been justified in another way. A tenth-century logician, Vācaspati Miśra, wrote[1]

> The *Conclusion* thus is not the same as the *Thesis:* the latter puts forward the fact only tentatively, as requiring confirmation by the reasoning with the aid of the *Reason* and the *Example*, while the former puts it forward as one fully established, and thus precluding the possibility of the truth being contrary to it. This cannot be done by the *Thesis*; as, if it did, then the rest of the members would be entirely futile.

Is a tentative thesis of the same 'form' as an established conclusion ? Jhā sees their identification as the source of the paradox that every syllogism is question-begging, and the distinction between them as resolving it.

Turning now to fallacies, it will be enough to discuss, first, the treatment given by Gautama in the *Nyāya sūtra* and, second, the gradual change that took place in the tradition thereafter.

Gautama refers his fallacies to the 'reason', or second member of his syllogism. Vātsyāyana says that fallacious reasons 'are so called because they do not possess all the characteristics of the true reason, and yet they are sufficiently similar to the true reason to appear as such'. Gautama briefly and without detail or justification lists five classes of them. (1) First, a reason may be 'erratic' or 'inconclusive': Vātsyāyana's example is 'Sound is eternal because it is intangible', where in fact some intangible things are eternal and some not. (2) A reason may be 'contradictory' if it is in contradiction to something the proponent has already accepted or is known to hold. Vātsyāyana gives the example of two Yoga doctrines 'The world ceases from manifestation, because it is non-eternal', and 'The world continues to exist, because it cannot be utterly destroyed': these cannot both be right, and once

the first is accepted the second is fallacious, since its reason contradicts the earlier reason. (3) A reason may be 'neutralized' if, instead of leading to a decision about the thesis, it leaves matters undecided. It may do this because it is actually only a repetition of the thesis, and Vātsyāyana's example (p. 90) is 'Sound is non-eternal because we do not find in it the properties of the eternal thing'. (4) A reason may be 'unknown' or 'unproved'. 'Shadow is a substance, because it has motion' is of this character, says Vātsyāyana (p. 92), because it is not known whether a shadow has motion: 'Does the shadow move, like the man? or is it that as the object obstructing the light moves along, there is a continuity of the obstruction...?' (5) Finally, a reason may be 'inopportune' or 'mistimed'. What Gautama means by this it is impossible to guess, but if commentators are to be believed it could be something to do with the fact that thesis and reason, as tensed statements, are true one at one time and one at another but not both together, as with Boethius's Fallacy of Different Time. Alternatively it could be just that the members of the syllogism are in the wrong order and, perhaps, that the thesis proves the reason rather than vice versa.

This list of five classes of fallacy formed the basis of various elaborated classifications of later writers, much in the way Aristotle's list did in Europe. If we suspend consideration of the impenetrable fifth one they are all, in a broad sense, 'formal': either the never-stated major premiss, the rule that is needed to justify the passage from reason to thesis, is false, or it is tautological, or the reason itself is unproved or elsewhere contradicted. It is true that some of the objections would not have been classified as 'formal' in the sense required in the West and which derives from Aristotle's *Prior Analytics*: the first class would be simply a case of false (suppressed) premiss, the second would be a case of a possibly-valid inference open to objection *ad hominem,* and the other two would be varieties of question-begging. None of them, however, involve variations in the meanings of words or phrases as in Aristotle's Fallacies Dependent on Language, and the kinds of dialectical irregularity that are involved are of a kind that can easily be provided with a formal analysis.

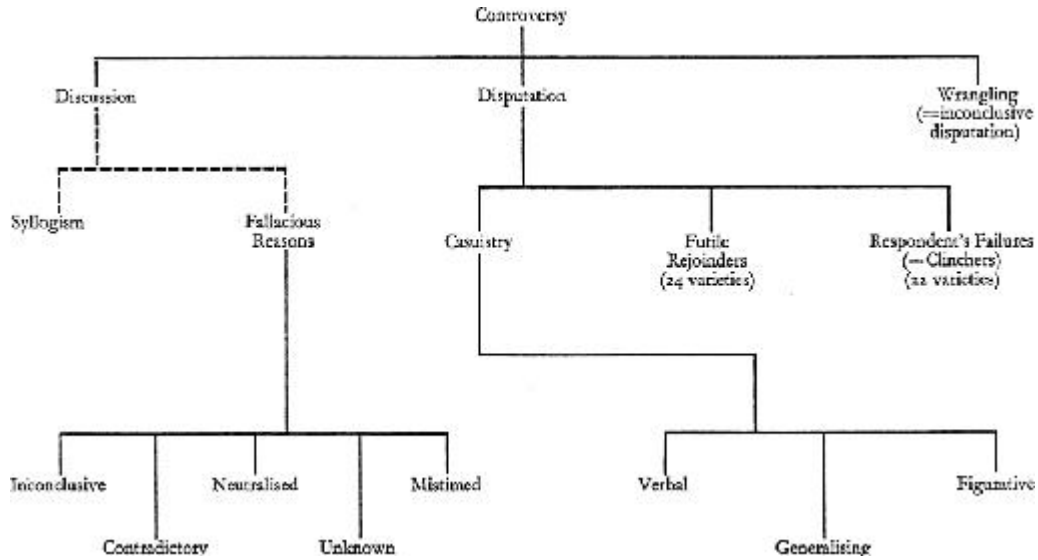
The *Nyāya sūtra*, however, also has a good deal to say about other kinds of logical fault or error. The section on fallacies had started out with a definition of three kinds of 'controversy'; namely, (1) Discussion, which is (p. 80) 'the putting forward (by two persons) of a conception and counter-conception, in which there is supporting and condemning by means of proofs and reasonings ... carried on in full accordance with the method of reasoning through the five members'; (2) Disputation, which is discussion 'in which there is supporting and condemning by means of Casuistry, Futile Rejoinders and Clinchers'; and (3) Wrangling, which is disputation that is inconclusive. From the order of treatment it appears that the fallacies we have so far been discussing are such as occur primarily in the first of these three kinds of controversy and, though to be condemned, are of a lesser order of evil than what follows. Disputation and Wrangling, we are told, may be employed to keep up our zeal for truth 'just as fences of thorny boughs are used to safeguard the growth of seeds', and are of use against people who will themselves not argue properly.

Casuistry is of three kinds, of which the first is no more nor less than Equivocation, though the examples that Vātsyāyana gives of it make it equivocation of a particularly trivial kind: the word *nava* means alternatively 'new' or 'nine', and when someone says 'That boy has a new blanket' the casuist says 'No, not nine blankets, only one'. He goes on, however, to mention the circumstantial ambiguity of words, with examples like those of Sextus (p. 98):

> ... when such expressions are used as – 'take the *goat* to the village,' 'bring *butter*', 'feed the *Brāhmaṇa*' – every one of these words ('goat', 'butter' and 'brāhmaṇa') is a general or common term and yet it is applied, in actual usage, to particular individuals composing what is denoted by that term; and to what particular individuals it is applied is determined by the force of circumstances;...

The casuist can put the wrong *denotation* on a word, and this is to be regarded as equivocation also.

The second kind of Casuistry is 'Generalising Casuistry', which consists in taking a speaker's words more generally than he intended them, and is slightly reminiscent of *Secundum Quid.* Someone who says 'Learning and character are quite natural to a *Brāhmaṇa*, does not necessarily intend 'delinquent' *Brāhmaṇas*, those who have not gone through all the rites and ceremonies, to be included and it will be casuistical to take him as doing so. The third kind of Casuistry is 'Figurative Casuistry' which consists in shifting the primary meaning of an opponent's words. Vātsyāyana discusses in some detail the difference between the first and the third.

The Nyāya sūtra's *Classification of Controversy*


What Jhā translates as 'Futile Rejoinders' and 'Clinchers' are dealt with in the *Nyāya sūtra*'s last, fifth book which has sometimes been regarded – on what evidence I do not know – as written independently of the rest. This part of the book has had a bad press, for reasons we shall explore in a moment; but its aim has clearly been misunderstood, and we shall find a syndrome that is by now familiar from our study of the fate of the early Aristotle. The list (pp. 502 ff.) of twenty-four 'Futile Rejoinders' – the translation seems a little exotic, since the Sanskrit word is just *jāti* – is a list of ways in which a piece of syllogistic reasoning may be 'equalized': that is, of ways in which an opponent may bring arguments that balance or neutralize the original reasoning without challenging it on its own ground,

in the way the author would consider proper. The twenty-two 'Clinchers' (pp. 540 ff.) – the word is *nigrahasthāna* which has sometimes been translated 'Respondent's Failures' are ways in which the *proponent* of a thesis can spoil his case with dialectical shortcomings. The two lists can be seen as complementary if we imagine them as a manual of debating tactics, and as setting out possible dialectical faults of the opponent and proponent, respectively, in a debate. Stcherbatsky, in his well-known book on Buddhist Logic, does not mention the first list at all but says of the second[1]

> The Manual on the Respondent's Failures was evidently a manual for the judge, its composition the result of a long experience in the practice of the art of debating, which resulted in the establishment of a system of type-instances and laws regulating the debate.

The term 'respondent', borrowed from the Western tradition, presupposes a question-and-answer form of debate which may or may not have been usual; and there is no direct reference in Gautama or Vātsyāyana to a 'judge'. Nevertheless this properly represents the tone of the fifth book.

The 'Futile Rejoinders', necessarily too briefly described to do them full justice, and with the omission of a few which are obscure or repetitious, are as follows:

[1and 2] argument for a contrary of the thesis (i.e. without destroying the original one),
[3] arguing that the example proves other things as well,
 [4] arguing that the subject of the thesis lacks some properties of the example,
[5and 6] arguing that the property in question is uncertain in the example, or less certain than in the subject,
[7] arguing that the example is contingent,
[8] presenting the example as equally well to be proved from the thesis (i.e. the claim that the example begs the question),
[9and 10] arguing that the reason is 'united with' the thesis, and cannot prove it; or that it is unconnected with it, and cannot prove it,

[11] arguing that the reason is itself in need of proof,

[14] independently throwing doubt on the thesis,

[17] arguing by *reductio ad absurdum*, on the presumption of consequences the proponent might not grant,

[18] objecting generally to the method of argument by example,

[20] arguing that the thesis is in fact known to be false,

[21] (perhaps) arguing that the thesis is not known not to be false.

It will be seen that even arguments quite good in themselves, as in [1] and [2] and, above all, [20]!, are regarded as 'futile' when they come *in answer to* the original reasoning. This does not mean, presumably, that the opponent should not put them forward but only that, in neutralizing the original reasoning, they are themselves neutralized as well. It is not the opponent's job to establish a counter-thesis at all.

'Clinchers' or 'Respondent's Failures' are easier to summarize: the following list partly follows Stcherbatsky. The proponent of an argument *may* be criticized for:

[1] annihilating his own thesis by an unsuitable example,

[2] shifting to another thesis,

[3] giving a reason that contradicts the thesis,

[4] abandoning the thesis,

[5] changing the reason originally given,

[6] irrelevancy,

[7] giving meaningless sounds as a reason,

[8] giving an assertion that is unintelligible even though stated three times,

[9] giving a syllogism such that there is no connection between the members,

[10] stating the members in the wrong order,

[11, 12] reasoning that is incomplete, or redundant,

[13] repetition,

[14, 15] failure to restate, or understand, opponent's objection,

[16] admission of ignorance,

[17] breaking off the debate (thus conceding defeat),

[18] admission of a flaw in his reasoning,

[19, 20] neglecting to rebuke the opponent when necessary, or doing so when not necessary,

[21] irregular discussion.

[22] fallacious logical reasons.

Only a few comments need be made on these lists, which reveal a preoccupation with orderly debate as strong as anything in Aristotle. The first concerns item [22] of the second list, whose inclusion is quite out of place with the classification-scheme suggested earlier by Gautama and is perhaps evidence of separate origin, though it could as easily be due to a conflict between two conceptions in the mind of a single writer. The second is the startling similarity between some of the individual items and some of Aristotle's. Two hypotheses are possible: that there was contact between, or a common origin of, the two traditions; or that formal debate is an important or necessary ingredient of any intellectual culture at a certain stage of its development, and is the driving force behind the development of Logic. They are not, of course, mutually exclusive.

The precise shape that formal debate took at the time of the *Nyāya sūtra* can be only dimly guessed at. There do exist records of formal debates from Buddhist sources at an earlier period, the reign of King Aśoka, about 255 B.C.[1] They seem to consist of phases in which the two disputants alternately take the floor, and each phase consists of the statement of a single argument, perhaps preceded by a number of clarificatory questions addressed to the opponent. I quote (with my own minor amendments) the first two phases of a debate between monks of rival views concerning the reality of the soul:[2]

PRESENTATION

Sceptic   Is the soul known in the sense of a real thing ?

Substantialist Yes.

Sceptic   Is the soul known in the way a real thing is known ?

Substantialist No, that cannot be said.

Sceptic   Acknowledge your defeat:

(i)   If the soul is known in the sense of a real thing, then, good sir, you should also say that the soul is known in the way a real thing is known.
(ii) What you say is wrong, namely (*a*) that the soul is known in the sense of a real thing, but not (*b*) known in the way any other real thing is known.
(iii) if *(b)* is not admitted (*a*) cannot be admitted either.
(iv) In admitting (*a*) but denying (*b*) you are wrong.

REJOINDER

Substantialist Is the soul not known in the sense of a real thing?

Sceptic   No, it is not.

Substantialist Is it unknown in the way a real thing is known?

Sceptic   No, that cannot be said.

Substantialist Acknowledge the rejoinder:

(i) If the soul is not known in the sense of a real thing, then, good sir, you should also say that the soul is unknown in the way a real thing is known.
(ii) What you say is wrong, namely (*a*) that the soul is not known in the sense of a real thing, but not (*b*) unknown in the way a real thing is known.
(iii) If (*b*) is denied (*a*) cannot be admitted either.
(iv) In admitting (*a*) but denying (*b*) you are wrong.

A judge, elected by the assembly (of monks), presides. Whether this is the kind of debate Gautama had in mind remains, however, conjectural.

Most of the works written directly in the Nyāya tradition are actual commentaries on the *Nyāya sūtra*, or commentaries on commentaries. Some of them ring changes on the doctrine without fundamentally altering it. Many invent, like Aristotle's commentators in medieval times, elaborate fine subdivisions of the various categories and, at the hands of Uddyotakara (seventh century), the original fivefold division of fallacies reaches the record grand total of 2,032 subdivisions. We need not investigate these subtleties. Many of the histories subdivide the tradition by religious groupings, so that we are presented in the sixth century with the separate 'Logics' of Praśastapāda (Hindu, Vaiśeṣika tradition), Siddhasena (Jain), and Diṅnāga (Buddhist), but the divisions refer more to epistemological doctrines than to the purely logical topics that here interest us.

Diṅnāga is the most original of these writers and must here do duty for the others. Although he is not uninterested in controversy his theory of inference displays a move away from Dialectic: his 'syllogism' drops the last two members, leaving only *Thesis, Reason*, and *Example,* though he adds the concept of a *Counter-example* in an attempt to eke out the deficiencies of this argument by analogy: 'The hill is fiery, because it is smoky, like a kitchen, unlike a lake'. It is not clear whether the Counter-example is meant to support the converse of the general argument or merely the contrapositive. He explicitly rejects Testimony as a basis of argument. On fallacies he gives a fourteen-fold classification of defects that is completely formal in character and tied to his theory of the syllogism: fallacies may infect the thesis, the reason or the example, and these in various ways. The reason, for example, may be 'too wide' or 'too narrow', the reason or example may themselves be uncertain, and so on. Diṅnāga does not attempt to classify controversy as the *Nyāya sūtra* does, does not mention Casuistry, gives a list of only some of the Futile Rejoinders, and ignores Respondent's Failures.

Not only in Diṅnāga, but even in such of his contemporaries and successors as remained close to the Nyāya teachings, the second or 'contradictory' category of fallacy ceased to represent the circumstance of an opponent's contradicting his own doctrines and came to represent the

Fallacy of giving a reason that tends to contradict, rather than support, the proffered thesis. Hence, this too became formal in character. The obscure fifth category of fallacy was variously interpreted but tended to become a rag-bag of cases in which the truth of one or another member of the syllogism was regarded as questionable for extraneous reasons.

The move towards a formal, deductive logic continued after Diṅnāga, and Uddyotakara gave a version of the syllogism in which the Example was at last replaced by the statement of a general rule. The final turning-point came in the fourteenth century with the work of Gaṅgeśa and the growth of what has become known as the *Navya Nyāya*, or New *Nyāya*, school. Gaṅgeśa mentions Casuistry, Futile Rejoinders, and Respondent's Failures only to criticize them, and this seems to be the last point in the history of Indian Logic at which they have seriously been considered at all.

The development of Logic out of a theory of debate, and its ultimate repudiation of its origins, thus seems ultimately to have taken the same course in India as in the West. That the classical Indian list of fallacies, like that of the West, is still studied despite the loss of its principal rationale is support for the view that the study of fallacies in both places has a function different from its ostensible one.

[1] Vidyābhūṣaṇa, *A. History of Indian Logic*, Appendix B.

[1] I have used mainly *Gautama's Nyāyasūtras,* in the Jhā edition, which also contains Vātsyāyana's commentary; and have supplemented it with some of the extracts given in Bocheński, *A History of Formal Logic.* I have altered terms here and there where it was necessary to bring the translations into correspondence; on the whole preferring Jhā.

[1] *Sophistical Refutations,* 165b 4. Roger Bacon produces a startlingly similar phrase in defining dialectical probability: 'The probable is that which seems the case to everyone, and about which neither the crowd nor the wise hold a contrary opinion': *Sumule dialectices*, p. 313.

IV.—A Note on the Indian Syllogism

H. N. Randle

THE western syllogism has the appearance of having sprung all at once into existence, from the head of Aristotle, clad in complete mail. It has about it no marks of the labour of thought which brought it to birth, and seems more like a work of art than an organism with an evolution behind it. The Indian 'syllogism,' on the other hand, is an organism with its history plainly recorded in its structure: an untidy organism, too, with vestigial structures and rudimentary organs which are changing their functions while preserving more or less of their primitive form. And for this reason, perhaps, it may have something to tell us about the 'morphology' of thought which is not so transparently conveyed by the more perfect work of art, the Aristotelian syllogism. The more untidy organism may therefore repay study.

The Indian syllogism has neither Mood nor Figure.[1] It has what can be recognised as *corresponding* to the three terms of the Aristotelian syllogism. The 'major term' is denominated the Probandum, and the 'Subject' (or 'minor term') is defined as "that which has the Probandum doubtful."[2] What corresponds to our middle term is called by various names signifying Probans, Mark, Reason. But the Indian logician does not abstract M and P from their concrete embodiments; and he therefore distinguishes SM, or the Probans as it occurs in the Subject or minor term, from XM's, *i.e.*, the Probans as it is found in other concrete cases. And this becomes important in the case of an unlimited probans such as 'existence' or 'knowability'; or again in the case of a probans which is a peculiar property of the Subject, as 'audibility' when used to prove some conclusion about 'sound'. For, in the

former case, there are no X non-M's, and in the latter there are no XM's: which, on the Indian view of syllogism as an argument from Examples, casts a doubt on arguments employing such Probans.[1]

It is convenient to use symbols, and the familiar S, M, and P will serve: but the Indian logician did not use them, and they tend to misrepresent his point of view. The appellations major, minor, and middle term, are also misleading, at any rate in speaking of the earlier logic. The earlier[2] Indian logician never considers the distribution and quantification of the terms in the syllogism, and the way of regarding subsumptions which is exemplified in Euler's circles, and which is second nature to us trained in the formalism of Western school logic, does not seem to have entered into his account of syllogism. The whole business of conversion and immediate inference, essential to our formalism, is unknown to Indian logic, so far as I am aware. It is therefore a mistake to equate the Indian logician's list of fallacies with our Undistributed Middle, and Illicit Process. And because his syllogism has no doctrine of Figures[3] it is undesirable to equate his arguments with Barbara, Celarent, etc.

After this statement of what Indian logic is *not*, it might seem that there is little left for it to *be*, at any rate as an 'art'; and it might seem that it can have no content worth mention. How could such a logic provide Rules and Canons of syllogism or any criteria for distinguishing valid from invalid subsumption ? The doubt may seem to find confirmation in memories of the Indian syllogism as quoted (quite correctly) in some of our manuals of logic —a cumbrous affair of five propositions, two of which seem vain repetition, while the 'major premise' is stated in an apparently unnecessary double positive-negative form, and supported by examples always—apparently— superfluous, and sometimes puerile.

1. That hill is on fire,
2. Because it is smoking;—
3. As smoke and fire go together, on the hearth, while non-smoke and non-fire go together, in the lake,
4. So here: [so *not* here:]

5. Therefore is that hill *so, i.e.,* on fire.

(The reference of course is to forest fires in the mountains.)

That seems to have been the early form of the syllogism[1] —a *paradeigma* or argument from particular to particular through likeness or unlikeness; and yet on its way to becoming an explicit 'deduction' from a universal connexion, or *vyāpti*, 'Pervasion' of smokiness by fieriness. This element of *vyāpti* later came to be more and more emphasised, until the example got the appearance of an excrescence, although always retained as an element in the third member of the five-membered syllogism. The third member then took the form:—

> All that is smoky is fiery, as the hearth; and all that is not fiery is not smoky, as the lake.

That is, the element of analogy is now obscured, for the 'so'[2] of the fourth and fifth members no longer appears as correlative of the 'as' in the third member, but as a mere demonstrative standing for the M and P of (what is now) the major premise. And the third member has now crystallised into a formula with the order of terms fixed:—

> All M is P … and All non-P is non-M.

It is in this developed form that the Indian syllogism is quoted in European books. The European reader then says to himself: "This of course is a combination of a syllogism in *Barbara* with a syllogism in *Cesare:*—

> All that is smoky is fiery
> This hill is smoky
> Therefore it is fiery
> *and*
> Nothing that is not-fiery is smoky
> This hill is smoky
> Therefore it is not non-fiery, *i.e.,* it is fiery.

One of these syllogisms is unnecessary: the two examples are superfluous: and the first two members are identical with the last two and serve no purpose."

All these three criticisms have been anticipated by Indian logicians. As regards the last, a distinction was made between 'inference for oneself' and 'inference for another' (*i.e.,* the setting out in words of a reasoned belief for the instruction of others), and the five-membered syllogism was by some logicians confined to 'inference for another'.[1] Ordinarily all schools state their inferences with the utmost possible brevity, in the form: "The hill is on fire, because smoky; like the hearth." But it will be noted that the *example* is retained, even in this abbreviated form.[2] The third member was always called, not after the statement of concomitance which it contained, but after the *illustration* of that concomitance included in it: that is, it was known as the *Example* (*udāharana*). The five members of the full syllogism were called (1) the Proposition, (2) the Reason, (3) the Example, (4) the Application, (5) the Conclusion.[3] For us it is the 'major premise' that conveys the relation of the middle to the minor; for the Indian logician it was always the 'Example' that carried this function.

And that is why (to revert to the second of the three criticisms brought against the Indian syllogism) the third member has the double positive-negative form. It certainly would be superfluous to state *in a 'major premise'* not only that All men are mortal but also that No immortals are men; because, as the Indian logician was well aware,[4] the one form implies the other. But so long as the weight of your argument is felt to be carried by the *example*, the case is different: and it is now necessary to give two examples, one of positive concomitance of M and P, and the other of negative concomitance—one an XMP, the other an X non-M non-P. For an example of positive concomitance *alone* proves nothing: but if an example of negative concomitance is adduced at the same time, then, *under certain conditions* your *paradeigma* may amount to a demonstration of the conclusion.

What are these conditions ? How far was the Indian logician able to formulate them without that apparatus of mood and figure and distribution of terms which constitutes formal logic for the western schoolman? Is there

any way of laying down syllogistic canons other than that of the Dictum de Omni et Nullo?

If Example is made the nerve of demonstration, the validity of the argument will obviously depend on whether or not a concrete *enstasis*, or 'instance' in the shape of a *counter-example*, is forthcoming. The material with which logic, so conceived, would work, would be Positive Examples (MP), Negative Examples (non-M non-P), and 'Instances' in either of two forms (M non-P, and non-MP). And the Canons of the syllogism, conceived thus as an affair of Examples and Counter-examples, would consist in a statement of *what examples, in the absence of what 'instances*,' will establish a valid conclusion.[1] Such Canons are to be found in a doctrine of the Three Characteristics of the Reason (*trirūpahetu*) formulated both by the Buddhist logician Dignāga[2] and the orthodox philosopher Prasastapāda, perhaps about 400 A.D.; and passing through their formulations into the general logical stock-in-trade of the Indian schools.

The three characteristics which the middle term must have are:—

1. It must reside in the Subject.[3]
2. It must reside in Positive Examples only.[1]
3. It must be only[1] absent in Negative Examples.

The formulation of the Second and Third Canons is a clear case of botching, and the double use of 'only' is where the botching comes in. And the word *only* in both cases may well be the addition of a botcher who was trying to make a *paradeigma* do what it by its very nature could not do, *i.e.*, give a guarantee that no contrary case *could* be produced. You cannot prove '*only*' by examples. The utmost you can do is to challenge an opponent to produce his contrary case, his XM non-P, yourself producing cases of X non-P which are *non*-M. When you have done this you have exhausted the possibilities of your method. Experience has shown MP's. It has *not* shown M non-P's. On the contrary it shows non-M non-P's. And there you have the natural Canons of a syllogism which remains an affair of examples and counter-examples.

Of course there is an inclination to interpret the *Trairūpya*, the Three Characteristics, in terms of the *Dictum de Omni et Nullo*, as an affair of 'distribution of terms'; and I do not deny that there were tendencies in Indian logic itself towards the quantitative view embodied in the *Dictum*. And yet I think that the best way to understand the spirit of the *Trairūpya* is to forget the *Dictum*, and to interpret the Indian formulation of the syllogistic canons in the light of the original Indian conception of syllogism,[1] which had no terms and no notion of their distribution. It is in this light rather than in the light of the *Dictum* that we can best understand the List of Nine Valid and Invalid Types of Syllogism, contained in Dignāga's tract entitled the Wheel of Reasons Set in Order—the nearest approach that I know of in Indian logic to our *Barbara Celarent, etc.* The nine arguments represent all possible 'moods'[2] of the syllogism, invalid as well as valid—so that Dignāga's syllogism has at least the advantage of parcimony compared with ours. Two are valid. Five come under the head of *Inconclusive*.[3] Two come under the head of *Contradictory*.[3] The topic of all nine Types is the same—the eternity or transitoriness of sound: which means nothing to us, but was a much discussed question in the Indian schools. The nine arguments which follow will be found in a diagram facing page 100 of Dr. Vidyābhūsana's book. They are there arranged as follows; but I am not clear whether the arrangement in a square is Dignāga's or Dr. Vidyābhūsana's:—

<div align="center">The Wheel of Reasons.</div>

I.Inconclusive (unlimited).	II.VALID.	III.Inconclusive (too wide).
IV.Contradictory.	V.Inconclusive (too narrow).	VI.Contradictory.
VII.Inconclusive.	VIII.VALID.	IX.Inconclusive.

No. I. Sound eternal because an object of knowledge. (Inconclusive.)

Positive
example   Ether.[1]
XMP

Negative   (None is possible, for nothing can be quoted which is *not* an

Example	object of knowledge.)
Counter-Example XM non-P	A pot.

No. II. Sound non-eternal because produced. (VALID.)

Positive Example XMP	A pot.
Negative example X non-M non-P	Ether.
Counter-Example	(None is forthcoming.)

No. III. Sound an effect of effort or volition, because non-eternal. (Inconclusive.)

Positive Example XMP	A pot.
Negative example X non-M non-P	Ether.
Counter-Example XM non-P	Lightning.

No. IV. Sound eternal, because produced. (Contradictory.)

Positive Example	(None forthcoming.)
Negative Example	(None forthcoming.)
Counter-Example XM	A pot.

non-P

Counter-Example X non-MP	Ether.

(The two counter-examples provide the material for argument No. II., leading to the contradictory conclusion.)

No. V. Sound non-eternal, because audible. (Inconclusive.)

Positive Example	(None is possible in this Type, known therefore as 'the too restricted reason'. There is no XM, but only SM, since audibility is the peculiar property of sound.)
Negative Example X non-M non-P	Ether.
Counter-Example X non-MP	A pot.

(But of course no Counter-Example in the fatal form of XM non-P will be forthcoming, as there are no XM's. The case must be argued in the field of non-M's.)

No. VI. Sound eternal, because an effect of effort. (Contradictory.)

Positive Example	(None is forthcoming.)
Negative Example X non-M non-P	Lightning.
Counter-Example XM non-P	A pot.
Counter-Example X non-MP	Ether.

(The two Counter-Examples provide the material for argument No. VIII., leading to the contradictory conclusion.)

No. VII. Sound a non-effect-of-effort, because non-eternal. (Inconclusive.)

Positive Example XMP	Lightning.	
Negative Example	(None forthcoming.)	
Counter Example XM non-P	A pot.	
Counter-Example X non-MP	Ether.	

(Here the positive example prevents the two counter-examples from establishing the contradictory conclusion, as they do in No. VI., — so that the reasoning is merely inconclusive.)

No. VIII. Sound non-eternal, because an effect of effort. VALID.

Positive Example XMP	A pot.	
Negative Example X non-M non-P	Ether.	
Counter-Example X non-MP	Lightning.	

(A counter-example in the form X non-MP does not affect the validity of the argument. Contrast No. III. In the other VALID argument, No. II., there are no non-MP's, because, as we should say, the major premise is simply convertible, *i.e.*, all M is *all* P.)

No. IX. Sound eternal, because corporeal; (*or*, because incorporeal). (Inconclusive.)

Positive
Example   Atoms.
XMP

Negative
Example X   Action.
non-M non-P

Counter-
Example XM A pot.
non-P

Counter-
Example X   Ether.
non-MP

(If you take 'incorporeal' for the middle term, the counter-examples become the examples.)

Such a list underlines the fact that a counter-example in the form XM non-P is fatal whereas a counter-example in the form X non-MP does not matter: which *amounts* to saying that All M must be P and that All non-P must be non-M; whereas it is not necessary that All P should be M and that All non-M should be non-P. From the time of Prasastapāda and Dignāga the latter mode of formulation had established itself and the 'major premise' had crystallised into the two propositions with order of terms fixed and subject 'quantified'—All M is P; All non-P is non-M. But the other way of formulating the syllogism, by example and counter-example, was the original way, and it continued to survive alongside of the new method. Hence the double character of the Indian syllogism (in respect of its third member, the so-called 'Example'), and hence the rather confused combination in the *Trairūpya*, or syllogistic Canons, of the two points of view. That the syllogism still continued to be regarded as an affair of examples is evidenced by the interpretation commonly put upon the second

and third Canons. They were usually interpreted to mean, not merely that all M must be P and that all non-P must be non-Mb; but further that there must be *actual examples* (other than S) of M being P, and also *actual examples* of non-P being non-M. That is, the second was taken to mean that actual XMP's must be forthcoming; while the third was taken to mean that actual X non-P non-M's must be forthcoming. And these requirements become of obvious importance in the cases of two of the Types of argument given in the Wheel of Reasons,—the argument from an *unlimited* reason (No. I., sound is eternal because knowable): and the argument from a *too limited* reason (No. V., sound is non-eternal because audible). For in the former case *there is no non-M:* and in the latter case *there is no XM.* Indian opinion divided itself in a very significant controversy as to whether arguments in these two types could ever be regarded as valid. It is worth while considering these two types in more detail.

No. I., the unlimited or '*Purely Positive*' Reason:

The example of this given in the Wheel is open to the fatal counter-example of the pot which is of course knowable, and yet not eternal. But if an unlimited middle term is used to prove an *unlimited major*—as, the pot is nameable because knowable,—so that no counter-example in the form XM non-P is forthcoming, is this type of argument still inconclusive? Some rejected such arguments as breaking the third Canon—that the Probans must be absent in negative examples—this being interpreted to mean that there must *be* negative examples, X non-M non-P. The orthodox school of logic (the Nyāya), however, maintains the validity of such arguments, classing them under a separate rubric under the name 'purely positive' (*kevalānvayin*). The real solution of the controversy no doubt is that the reasoning would be invalid if it were paradeigmatic: and the Indian logician makes syllogism an affair of examples. But in this type of argument the positive 'examples' are as irrelevant as negative examples are impossible. For the reasoning is not by examples at all, but implicative—a matter of 'agreement of ideas,' and not of evidence. And, as such, it is valid reasoning, though invalid *paradeigma.*

No. V., the '*too limited*' or '*Purely Negative*' Probans:

Sound non-eternal because audible. Obviously we could just as well argue that sound is eternal because audible, for no XM can be adduced, since the M, audibility, is the peculiar property of the S, sound. The argument is therefore confined to negative cases, X non-M's, things that are not the object of the auditory sense—and of these some are eternal and some are not. (Sound itself of course cannot be used as an example, SMP, for S, the minor term, is by definition "that which has the probandum *doubtful*".)

But suppose that in the sphere of negative cases, X non-M's, as a matter of fact P is *not* found, so that no enstasis to the experience X non-M non-P is forthcoming (in the form of a counter-example X non-MP). The Nyāya school, which defends this type, under a rubric of 'Purely Negative' Probans (*kevalavyatirekin*), adduces as an instance of a valid inference in this type the argument "The living organism has a soul because it has vital functions." No positive example can be quoted, other than the living organism itself, of things possessing vital functions. But within the sphere of things *not* possessing vital functions—pots and the like—no one would assert the existence of soul: so that to the negative example X non-M non-P no enstasis in the form X non-MP is forthcoming.

There is the same division of opinion about this 'Purely Negative' type as there is about the 'Purely Positive' type; some rejecting it as a breach of the second Canon—that the Probans must reside in Positive Examples only: which is interpreted to mean that there must *be* a positive example, XM. And here again the solution of the controversy seems to be that such arguments are invalid *paradeigmata*,[1] but may still be valid inferences by presumption or implication within a system. Again it is a matter not of evidence and example, but of the agreement of ideas. The Indian school-man starts from the view that all inference is an affair of examples. He then comes across valid inferences which refuse reduction to the normal type. He therefore invents abnormal types which are paradeigmata only in appearance, in order to provide for these cases.

These two Types are therefore of interest as pointing the moral that a view of inference[1] as subsumption under a major based on 'evidence' goes bankrupt as soon as it has to deal with reasoning that depends, not on

evidence, but on the agreement and disagreement of ideas (to use Locke's phrase again). It seems to me that the whole of mathematical reasoning would have to go into the purely negative Type—with ludicrous results. If I wanted to prove that five and seven are twelve, I should probably say to myself "twice five are ten; and two makes twelve". No positive example is available, other than seven *plus* five itself. And to argue negatively that six and seven, etc., are not twelve, and therefore five and seven *are*, does not recommend itself as a reasonable alternative.

The moral is pointed so plainly by Indian logic, just because Indian logic insisted on the concrete examples which the western syllogism finds superfluous. What the Indian logician says, in effect, is: "If you are going to have an argument which you can call a valid 'syllogism,' you must be in a position to support your 'major premise' by concrete cases other than the Subject or minor term." The western student would retort: "If you have a genuine universal—a *vyāpti*—for your major, the citation of examples is perfectly irrelevant. *Your* syllogism is a cross between an indecisive analogy or argument from particular to particular on the basis of similarity, and a cogent deduction from a universal principle on the basis of identity of nature."

The question cannot be profitably debated further without asking the critic of the Indian syllogism whether he supposes the major premises of *his* syllogisms to be always derived from particular cases—examples—by induction. If his answer is in the affirmative it seems to me that he has no case against the Indian view of the syllogism as an affair of examples. And Mill in his criticism of the syllogism is in fact practically affirming what the Indian formulation affirms — that the reasoning is from particular to particular, since the major premise adds nothing to the *evidence* for the conclusion. The evidence is the Examples. The critic's syllogism is then a hybrid, being no more than a *paradeigma* which conceals its humble origin in the particular by suppressing those Examples on which the Indian syllogism insists.

A subsumption of this sort, at any rate, *i.e.*, under an inductively established major, such as the Indian syllogism confessedly is, and such as

our text-book syllogisms for the most part really are, is a relatively inferior form of inference: and so it has not been content to remain within its own nature, but has reached out towards more cogent forms of inference. It has done this by substituting an explicit formulation of the universal for the concrete embodiments of it from which, as *paradeigma*, it really argues: and then, in the western school logic, by substituting the purely quantitative or mathematical[1] cogency of the relation between container and contained in the place of the cogencies of real relationship which are in truth the nerve of inference.

But in thus passing from an affair of examples into an affair of quantitative relations the paradeigmatic syllogism achieves a pseudo-cogency only at the cost of ceasing to be syllogism in any sense whatever. For it now becomes the eduction of quantitative relations or correlates within a purely quantitative system; and the major premise is no longer (what it purports to be) the principle from which the conclusion is *deduced:* but becomes just one of the quantitative data from which (in accordance with *implicit* mathematical principles) a quantitative result is *educed. Quantitatively considered*, the syllogism is no more syllogistic than are such arguments as 'A is to the north of B, and B is to the west of C, therefore A is to the north-west of C'. It is as purely 'relational' an inference as *they* are. And surely no light is thrown on the inner nature of all possible inferences by an attempt to throw them all into the common form of a problem of quantities—an affair of 'All and None'.[1]

With the development of the doctrine of *vyāpti* or universal connexion explicitly formulated, and with the substitution of the category of Class Nature (*sāmānya*) for Similarity (*sādharmya*) as the principle of syllogistic inference, Indian logic took the step which leads naturally to the quantitative view of the syllogism. But it developed a formalism[2] along different lines, and never elaborated the quantitative concept in the manner of the western school logic. The western formalism seems to me (partly no doubt owing to its familiarity) as a very much more efficient 'dodge': though I do not think it can claim to be a more philosophical formulation of subsumption than the Indian syllogism. Indeed, the retention of the

'Example' may be regarded as having given the Indian 'syllogism' a better chance of avoiding the fate of becoming a barren thought-form than the quantitative formulation gives it: for the quantitative theory of syllogism can only re-vivify itself in a theory of Induction, that is, in a theory of Example — which is what has happened to it in the West. India, however, failed to exploit the advantage of its insistence on the Example because it used its syllogism mainly for ontological and theological reasonings—that is to say, in just that sphere of inference within which 'induction' has least scope, and in which *therefore* the paradeigmatic syllogism is least applicable.

Both syllogisms, Indian and Western, have claimed to be the universal type of inference, and in both cases the claim has been questioned. In India the term used for inference is the term used for syllogism (*anumāna*), and therefore the demurrer against the claims of syllogism does not take the form of saying that there are other forms of *inference* apart from *anumāna*, syllogistic inference; but that of saying that there are other instruments of valid cognition (*pramāna*) besides (syllogistic) inference, perception, and authoritative testimony (which with Comparison are the four *pramāna's* recognised by the orthodox logical school): but the other means of valid cognition which the critics put forward are in fact other forms of *inference*— for instance *arthāpatti*, Presumption or Implication, the stock example of which is just a disjunctive inference.[1]

Criticisms of this nature have, in India, arisen from the fact that there are types of inference in which '*Example*' plays no part. In the West they rather arise from the difficulty of finding the characteristic *three terms* of syllogism in relational arguments. In both criticisms the emphasis is laid on the difficulty of *formulation*—on the Indian view you cannot find the *example* which the *Trairūpya* requires: on the Western view, you get a *quaternio terminorum* which the Rule of Syllogism forbids.[2]

On the whole the Indian scholastic has shared with the scholasticism of the West the view that syllogism is the ideal and universal type of inference. As regards the two methods of formulating it, my feeling is that the Western scholastic, with his quantitative apparatus of formalism, has been worshipping idols of the theatre not less, but rather more, than the Indian

scholastic with his 'Examples'; that the *Dictum de Omni et Nullo* is even further from the truth about inference than the Indian *Trairūpya*, or Three Characteristics of the Middle Term: and that the paradeigmatic syllogism of the Indian schools is on the whole preferable to BARBARA CELARENT.

1 But see below, footnote 3 to p. 399.

2 In the earlier logic the word translated literally Probandum, and confined in the later logic to the 'major term', was applied indiscriminately both to the major and to the minor term. The earliest commentator explicitly says that Probandum means either the Subject qualified by the property-to-be-proved, or the Property-to-be-proved qualified by the subject. This terminology seems to show that the Indian logician did not regard his 'terms' as separable entities: and if he had used symbols (as he never did) he might perhaps have written Sp is sP—instead of our S is P, *i.e:*, the difference between subject and predicate is rather a difference of emphasis within the same complex. It is noteworthy that (so far as I know) Indian logic has no *generic* name for the 'term'. The Indian syllogism has 'Members', but these are propositions.

Historically, the ambiguity of the word Probandum is due to the fact that it formed the first member of the two compounds *sādhyadharma* and *sādhyadharmin*, — *sādhya* meaning probandum, *dharma* property, and *dharmin* property-possessor. The former compound was used to refer to the 'major term,' and the latter to refer to the 'minor term,' so that the two things were distinguished by the mere difference in the noun-suffix. But the latter members in these two compounds were ordinarily omitted, so that the first member, *sādhya* = probandum, was left to do double duty as name for both major and minor term. This was so obviously inconvenient that another word, *paksa* (side, side to a discussion, thesis), came into use to denominate the minor term, leaving *sādhya* as the appellation of the major.

1 The terms Subject, Probans, Probandum, are borrowed from Dr. Gaṇganātha Jhā's translation of the Nyāya Sūtra and Bhāsya—published in *Indian Thought* (Allahabad and Benares, 1912–1920), and separately (Allahabad). This is a work which places all students of these difficult texts under very great obligation to the author.

2 A distinction between the Probans as 'pervaded' (*vyāpya*) and the Probandum as 'pervading' (*vyāpaka*) arose in connexion with the doctrine of universal connexion,—*vyāpti*, Pervasion. But it never developed into a quantitative account of the relation of the terms in a syllogism.

3 A passage in the seventh century Buddhist logical tract Nyayabindu treats of arguments from *Non-perception* as the Probans, as a separate type. These have a negative minor premise and a major of the form All P is M (in place of All M is P). And this is the essential character of the Second Figure. The author first points out that any argument may be put either positively or negatively. He calls the positive form the form 'based on likeness' (*sādharmyavat*), and the negative form the form 'based on unlikeness' (*vaidharmyavat*): which means that in the former case the minor premise has the same 'quality' as the major, in the latter it has the opposite 'quality'. But he adds that a mere change of form marks no real difference in the argument. It is the same thing to say

All M is P

S is M

Therefore S is P (the *sādharmyavat* form): and to say

> All non-P's are non-M
>
> S is not non-M

Therefore S is not non-P (the *vaidharmyavat).* But he notes that there is a particular class of arguments from non-perception as Probans,—

> All (possible objects of perception) which are present are perceive
>
> The pot is not perceived
>
> Therefore it is not present,—

in which the *vaidharmyavat* form is the form which the argument wil take when the major is stated in the direct or positive form (*anvaya*) This is a genuine CAMESTRES, with affirmative major of the All P is M type.*

He points out that you *can* express it as a *sādharmyavat* argument by putting the major in the indirect or negative form (*vyatireka*):—

> Whatever (possible object of perception) is not-seen, is not-present,
>
> The pot is not-seen
>
> Therefore it is not-present.

This of course is BARBARA in form—but not in nature. The truth about 'Figures' seems to be clearly enough apprehended here, though the Figure as a 'dodge' was not utilised in the Indian schools.

1 See Prof. A. B. Keith's *Indian Logic and Atomism* (Oxford Univ. Press, 1921), p. 87.

2 The earliest commentator says explicitly "the Application—fourth member—is a comparison (analogy), as is shown by the word 'so'".

1 It seems to me clear that this is the meaning of even the earliest commentator, Vātsyāyana, though he does not explicitly formulate the distinction between 'inference for oneself' and 'inference for another'. He never calls the five-membered syllogism 'inference' (*anumāna*), but refers to it as the Probative Statement (*sādhakavākya*). And in a significant passage (I., i. 39) he says that this Probative Statement, or syllogism, is a combination of the several means of knowledge (*pramāna*): the first member or Proposition being matter of Testimony; *the second or Reason being Inference;* the third or Example being matter of Perception; the fourth or Application being Comparison (also reckoned by some as a separate means of knowledge).

2 It was not uniformly retained. After the full development of the doctrine of universal concomitance or Pervasion (*vyāpti*) a feeling arose in some quarters that the example was superfluous, and it was rejected altogether by a few writers. But this was an abnormal doctrine, and contrary to the spirit of the Indian syllogism.

3 The conclusion is the restatement of the Proposition. A scholiast on the Prior Analytics observes that the 'problem' is the same as the conclusion: when put forward with a view to proof as something not known, it is called the problem: when proved it is the conclusion. Brandis, *Scholia*, p. 150, col. 2, 11. 38–46.

4 *E.g.,* the Buddhist logical tract *Nyāyabindu* follows up the useful principle that words are not necessary when the thing is understood, with a demonstration that the positive form of the *vyāpti* implies the negative and *vice versa.* Only one need be *stated.* Another work quotes the ingenious observation of a critic of the full syllogism, considered as 'Inference for Another,' to

the effect that other people's mental processes are difficult to get at, and that it is impossible to say that just so much verbal expression will convey understanding, and less will not.

1 Which amounts to saying that the Canons of syllogism are the Canons of 'induction'. And I believe that this is just what the Indian view of syllogism *amounts* to. Dr. B. Faddegon in his Vaisesika System (Amsterdam, 1918) calls the Indian syllogism a combination of a deduction with a superficial induction. See further on this point below.

2 Otherwise Dinnāga, a very interesting figure in the development of Indian logic, on whom see Stcherbatskoi's brilliant article in *le Muséon* (1904), n.s., vol. v., which has formed the basis of subsequent discussion. Dinnāga's works are unfortunately available only in Tibetan versions, but some account of them has been given by Dr. S. C. Vidyābhūsana in his *Indian Logic: Mediæval School.* I draw my account from this work.

3 In the older writers like Prasastapāda and (perhaps) Dignāga, the word translated Subject was still liable to the ambiguity noted above [the word used is the equivalent of *sādhya* and liable to the same ambiguity, as meaning either Subject (minor term) or Probandum (major term)]. It is therefore possible, even probable, that the first canon as originally formulated was an assertion of universal connexion between Probans and Probandum. Later writers, however, always took it in the sense in which it is translated above, *i.e.*, as the assertion that the Probans must be found in the Subject—S must be M. And this seems so much more likely an interpretation *prima facie* that it seems gratuitous to suggest that it originally had the other meaning. There are nevertheless strong reasons for believing that this was the case—see Keith, *Indian Logic*, pp. 137–138. If so, these Canons present exactly the same double character and the same redundancy as the syllogism itself presents in its third member, the 'Example' so-called, which combines a statement of 'Pervasion' (*vyāpti*) with concrete examples. As Dr. Keith says: "the explanation ... is perfectly simple. The three conditions represent a precise statement of the third member of the syllogism, the Example, when completed as it was in Prasastapāda's time by the enunciation of the general proposition." Dignāga is credited by modern critical historians of Indian Philosophy with the 'discovery' of the universal proposition, and it is supposed that Prasastapāda borrowed this and much else from him.

1 It is the word translated 'only' in the two latter Canons (Sanskrit *eva*, a particle of emphasis and exclusion) around which controversy as to the exact formulation of these canons has turned.

The Second Canon means that XP's (some, not necessarily all) must be M, and that no counter-example of X non-P being M must be forthcoming.

The Third Canon means that X non-P's (all of them) must be non-M, and that no counter-example of X non-P being M must be forthcoming.

The objection to the formulation is obvious—the 'only' of the Second Canon excludes precisely the same counter-examples as are excluded by the 'only' of the Third Canon. And as the Second Canon has already stated, by means of this exclusion, that all XM's must be XP's, there is nothing gained by the contrapositive statement in the Third Canon—that all X non-P's must be X non-M's. And I think that the formulation is in fact indefensible.

But it is easy to see how it grew into this form. First there is the need of positive examples, XMP's. Then there is the need of *denying* the occurrence of counter-examples XM non-P. And this denial *can only* take the form of pointing to X non-P non-M's. The limits of the method are in fact reached when you have pointed to XMP's and then (in answer to the suggested possibility of XM non-P's) pointed to cases of X non-P's which are non-M.

   1 By which I mean the earliest available account of syllogism. And this is to be found in the Nyāya Sūtra, and in Vātsyāyana's Bhāsya or commentary thereon. Neither can be dated, though Jacobi has attempted to date the Philosophical Sutras in the *Journal of the American Oriental Society*, vol. xxxi. (The references in the Vaisesika Sūtras are no doubt earlier, but hardly constitute an intelligible 'account' of syllogism.)

   2 But they are not 'moods,' rather Types.

   3 These are two of three classes of fallacy commonly recognised. A third class of fallacy is the *Unreal* reason, which consists in taking a middle term which is not found in the Subject, and thus constitutes a breach of the first canon. This class of fallacy is not represented in the Wheel of Reasons: the Wheel only sets forth all possible relations of the 'middle' to the 'major,' and does not concern itself with the relation of the 'middle' to the 'minor'.

   1 Dr. Faddegon, *op. cit.*, p. 108, remarks: "The translation of *ākāsa* by 'ether' is very misleading. It has nothing in common either with the Greek notion of ἀιθήρ or with the notion of ether as conceived by modern European physics. It is space as the medium through which sound is transmitted. I have called it 'physical space' in order to distinguish it from *dis, i.e.*, space regarded with reference to direction, termed by me 'mathematical space'." (*Dis* is the root found in Greek δείκνυμι. *Ākāsa*, etymologically, would indicate brightness or light. Philosophically, its function is to be the medium of sound, and the subtle stuff of which the inner organ of hearing is composed.)

   1 The trick of the *purely negative* pseudo-paradeigma is a fallacy of many questions. Your opponent maintains that there is no such thing as a soul. "Well then," runs the retort, "of course you will agree that inanimate things are soul-less?" The opponent (it is supposed) feels himself compelled *a fortiori* into this admission, having maintained the more comprehensive position that *everything* is soul-less. The admission provides you with the negative example free from enstasis which you consider *in this particular Type* sufficient for proof. As a matter of fact your argument will involve an illicit process of the major:—

Inanimate things are soul-less
The living organism is not inanimate
Therefore the living organism is not soul-less.

(The seventh century commentary Nyāya-vārttika states the argument in this form—*Bibliotheca Indica* edition, p. 126,1. 6. Later commentators 'convert' the major premise. The author of the Vārttika is of course aware of the objection to which his form of argument is exposed—that "it does not establish exclusion of soullessness in the living organism ". His reply takes the form of an *argumentum ad hominem*—the objector must beg the question if he tries to adduce an instance in which the exclusion of absence of vital functions does *not* exclude the absence of soul—for he can only adduce the living organism itself.)

It is impossible to get over this difficulty without begging the question openly: for to convert the major into the required form "All soulless entities are inanimate"is to deny *ab initio* the opponent's position that some soulless entities are animate, *viz.*, the living organism.

But the question has been begged already in presenting the opponent with a dichotomy into soulless and soul-endowed things, which is implied in asking him to admit that inanimate things are soulless. The prior question is whether the dichotomy within which the opponent is asked to make affirmation

or denial is a universe of reasonable discourse at all. From the opponent's point of view it is not—and therefore he need neither affirm nor deny.

[1] Some schools admitted the existence of inferential processes other than "syllogism" (*anumāna*). One such process is *Arthāpatti*, which English translations render either by 'Presumption' or by 'Implication'. The stock example of this is: "Devadatta, who is fat, does not eat by day: *ergo*, he eats by night." (Bosanquet too would have called this 'implication'.) The nerve of the process is that the facts (*artha* = thing) force some presumption upon the mind. It is thus that you know, for example, that there is a potency in the seed which makes it grow. The orthodox school reduces *arthāpatti* to the 'purely negative' type of syllogism.

[1] I think I remember the late Prof. Cook Wilson referring to 'the science of SMP' as a branch of mathematics.

[1] No less relational, and no more syllogistic, is the quite different type of argument from relations of identity, such as that which is sometimes adduced as a case in which the 'syllogism' plainly functions in the discovery of a new truth,—the case of the priest who has just said that his first confession was that of a murder—whereupon X enters the room and greets the priest with the remark that *he*, X, was the first person to make a confession to the priest. A is B. B is C. *Ergo*, A is C—X is a murderer. A good inference, but not assuredly a subsumption in any sense: having neither a universal premise stating a principle from which the conclusion is deduced; nor yet any 'example' adducible of universal connexion between being the first person to make a confession to this priest, and being a murderer. It is, a purely relational argument, the relation being that of numerical identity. I can see no excuse at all for calling such an argument syllogistic, except the accident that it happens not to involve the *quaternio terminorum*, which is obvious in arguments like A is to the right of B, and B to the right of C.

I suppose the orthodox Indian logician would have treated this argument from identity as belonging to the 'purely negative' type of syllogism:—

"X is a murderer,
Because he is the first person who made a confession to Y,
Those who were *not* guilty of this murder did *not* make the first confession to Y—like Z etc."And other relational arguments could be similarly treated—or maltreated. For this Type, as noted above, is a department of syllogism roo ny enough to hold the whole of mathematics.*We* get over the difficulty, in the case of the argument from identity, by treating singular propositions as equivalent to universals—a sufficiently uncritical procedure. We do not get over it at all in the case of the other relational arguments which involve *quaternio terminorum:* for attempts to construct a major stating the principle of the inference, whilst crowding all the data into a congested minor, may be disregarded as a confessed failure.

[2] The slight acquaintance which I have with the later developments of Indian logic perhaps justifies the statement that the formalism which Indian logic *did* develop is a far more terrible affair than anything the Western schools can boast of. It consists (externally at least) in the introduction, into definitions, of an almost incredible verbal complexity, in the form of compounds which are, quite literally, *sesquipedalia verba.* The acquiring of the habit of mind necessary for the unravelling of these syntax-less word-masses is a discipline of years, and one which I do not hope to undergo. This type of scholasticism commences with the twelfth century and flourishes to-day in the schools of indigenous culture.

[1] See footnote to p. 410.

2 The larger question is whether the universal always functions in inference in the way in which the syllogism represents it as functioning. The doctrine of syllogism, as universal type of inference, is that the universal acts always as an explicitly apprehended *unit* in the inference—it is a Member or Premise of the reasoning. There is in the mind a vast reticulation of concepts or points of view, *vyāpti's* (whether or not these are regarded as derived from prior concrete experiences); and syllogism is the process through which the special case is caught in the meshes of this net of abstractions—the logical ideal of reasoned truth being satisfied only if the universal is explicitly apprehended and formulated in abstraction from the particular embodiment of it to which the reasoning 'applies' it. That the universal sometimes functions in this way must be admitted. That it always does so seems to be an illusion of the schools.

The Concept of Pakṣa in Indian Logic

J. F. Staal

In studying a civilization different from our own we are prone to impose the conceptual framework and prejudices of our own tradition. The study of Indian logic by Western scholars, including Indian scholars who accepted certain tenets of Western logic, forms no exception. S. C. Vidyabhusana, the first historian of Indian logic, looked at his subject through eyes so colored by what he regarded as Aristotelian logic, that he talked of the 'Indian syllogism' and saw in it traces of the influence of Aristotle – a historical claim no serious student of Indian logic would nowadays wish to make his own. Moreover, like many other scholars of his generation, Vidyabhusana was not really familiar with Aristotle, but rather with what is generally called 'traditional logic', a mixture extracted from Aristotle, but enriched with the left-overs of numerous other dishes. A decade later, the great Russian pioneer of the study of Buddhist logic, Th. Stcherbatsky, adopted a Kantian framework and introduced thereby even greater confusion. For unlike Aristotle, who doubtless continues to be the greatest logician in the Western tradition, Kant was no logician, and the greatest weaknesses of his philosophy are due precisely to his ignorance of logic.

I present these remarks by way of introduction, but they should not be regarded merely as historical anecdotes. For the prejudices of Vidyabhusana and Stcherbatsky continue to affect our understanding of Indian logic. This is clear from the literature in Western languages even on such elementary notions as the concept of *pakṣa*. This particular notion is furthermore obscured by the fact, that the term *pakṣa* is within Indian logic itself not used unambiguously. And so we witness the growth of a dense jungle of

scholarship – first in Sanskrit, and next in Western languages – due to confusions around a notion that is basic and quite elementary. This paper attempts to clear some parts of that jungle.

There is no point in criticizing theories unless it is from the perspective of what one regards as the correct theory. Similarly, in order to appreciate precisely where and how some interpretations have gone wrong, we have to know the right interpretation first. I shall therefore begin by elucidating the most important and most technical meaning of the term *pakṣa* in Indian logic, which occurs throughout its development, Hindu as well as Buddhist, and which is in fact straightforward and simple. In Indian logic, entities are never considered as if they were hanging in the air, but always as occurring in a locus (*āśraya; ādhāra; adhikaraṇa*). In this sense, Indian logic has its feet firmly on the ground. This ground, in the case of any specific case of inference, is called its *pakṣa*.

In order to explain this a little more precisely I shall make use of formal expressions, thereby perhaps inviting the accusation that I am imposing on the Indian material a framework of modern mathematical logic, thus merely substituting a more fashionable bias for the Aristotelian and Kantian prejudices of my predecessors. But this in fact is not the case. I use symbols merely because they are more precise and unambiguous than ordinary English. By introducing them I do not import any notions, theorems, or theories of contemporary Western logic.

In Indian logic, an entity, say *x*, is never regarded in isolation, but always considered as occurring in a locus, say *y*. The fundamental relation which underlies all expressions is therefore the relation which obtains between each entity and its locus. Since such a relation relates *x* to *y*, it is a two-place relation, which may therefore be written as:

(1)

$$A(x, y)$$

This may be read as: '*x* occurs in *y*', or, alternatively, as '*y* is locus of *x*'. The relation *A* may be called an occurrence relation.

Given such relations, an inference is not merely a relationship between two entities, but a relationship between two entities as occurring in a locus. It would therefore be incorrect, or at least a rather rough approximation, to express the relationship between h, the *hetu* 'reason' and s, the *sādhya* "thing-to-be-inferred, inferendum"[1], as:

(2)

$$h \rightarrow s$$

It is more appropriate to express the relation of inference as a relation between two occurrence relations of the type (1), i.e., as:

(3)

$$A(h, p) \rightarrow A(s, p)$$

This may be read as follows: 'if the *hetu* occurs in p, then the *sādhya* occurs in p'. Here the particular locus p in which the particular inference between h and s occurs, is what is called the *pakṣa*. In the stock example, the *hetu* is smoke, the *sādhya* is fire, and the *pakṣa* is a mountain. On this interpretation, (3) may be read as: 'if smoke occurs on a mountain, then fire occurs on that mountain'.

Part of the later history of Indian logic is the attempt to generalize expressions of this form in such a way, that they hold not only for a specific *pakṣa*, but for all loci. What is then attempted is to arrive at expressions equivalent to:

(4)

$$(x) \left(A \left(h, x \right) \rightarrow A \left(s, x \right) \right)$$

which may be read as: 'for all x, if h occurs in x, then s occurs in x'; or: 's occurs wherever h occurs' (cf. Staal, 1962). I am not concerned with these later developments (treated in *navya-nyāya* in some of the commentaries upon the section called *pakṣatā* of the *Tattvacintāmaṇi*), but shall confine myself to the original notion of *pakṣa* itself.

Vidyabhusana interpreted the notions of *pakṣa, hetu* and *sādhya* in terms of traditional logic as minor term, middle term and major term respectively (e.g., Vidyabhusana, 1921, pp. 176, 312). In order to see to what extent this is correct we shall have to go back to Aristotle (cf. Bocheński, 1951, pp. 42–46). Aristotle considered primarily sentences of the form 'x belongs to y', which may be symbolized as:

(5)

$$B\,(x, y)$$

A syllogism then consists of two premisses of the form (5) from which one conclusion again of the form (5) is derived. Different types of syllogism are obtained by substituting for 'x' and 'y' in the premisses and in the conclusion three terms: one in one of the premisses and in the conclusion; another in the other premiss and in the conclusion; and a third in both premisses. The third term is called 'the middle'; the other two, 'the extremities'. The following is an example, where D is the middle term, and C and E are the extremities:

(6)

$$B\,(C, \text{all } D)$$
$$B\,(D, \text{all } E)$$
$$\overline{B\,(C, \text{all } E)}$$

or: 'if C belongs to all D, and D belongs to all E, then C belongs to all E'.

Of the extremities, one is called the minor term and the other is called the major term. These terms, however, are not defined according to their formal position in syllogisms of the form (6); rather, they are defined, at least for the first figure[2], according to their *extension*. What this means is best seen when (6) is illustrated as follows:

(7)
Here, *E*, which has the smallest extension, is the minor term; and *C*, which has the largest extension, is the major term.

We are now in a position to return to Indian logic. It is obvious why Vidyabhusana thought that the *hetu* corresponds to the middle term: neither the *hetu*, nor the middle term occurs in the conclusion of the inference. That is to say, the *hetu* does not occur on the right side of (3), i.e., in:

(8)

$$A\ (s, p)$$

and the middle term does not occur in the conclusion of (6), i.e., in:

(9)

$$B\ (C, \text{all } E)$$

It is also clear why he thought that the *pakṣa* and the *sādhya* correspond to the minor term and the major term, respectively: for (8) or 'the *sādhya* occurs in the *pakṣa*' looks somewhat like (9) which seems to express: 'the major term belongs to all the minor term'.

But if we look a little more closely here, we discover that these interpretations are nothing but the results of a confused muddle. In the Aristotelian syllogism, there are two premisses and one conclusion, and all three are of the same form, i.e., (5). In the Indian inference, on the other hand, there is only one premiss, viz., *A* (*h*, *p*), and the two relations from the *hetu* to the *pakṣa* and from the *sādhya* to the *pakṣa* are always the same relation, namely the occurrence relation *A*. There is an entirely superficial

and fortuitous similarity between the particular syllogism illustrated in (6), and the general form of the Indian inference, viz., (3). The three terms in Aristotelian logic, and in the traditional logic which is derived from it, are all of the same category. The Indian *pakṣa*, on the other hand, is an entirely different kind of thing from the *hetu* and the *sādhya*: it is the particular locus in which both the *hetu* and the *sādhya* happen to occur; it plays no part in the inference itself, though it is inseparable from each of its two terms. The *pakṣa* is the locus where the *hetu* occurs, and where the occurrence of the *sādhya* is doubted and sought to be established.

The difference may also be formulated thus. In Aristotle's syllogism the three terms are always related to each other through a relation of the form B (x, y) or 'x belongs to y'. In the Indian syllogism there are two terms, h and s, which are always related to each other through the relation of *pervasion*; both h and s are in addition related to the locus p but only through the occurrence relation A.

Vidyabhusana's erroneous identifications and comparisons have been repeated or relied on by almost all later interpreters of Indian logic. Stcherbatsky entangles them even further in his *Buddhist Logic*, but this deserves separate treatment, and I shall return to it. Some scholars confine themselves to using the terms 'minor', 'middle' and 'major' for the three Indian terms, without referring to the function which these former terms have in Western logic (e.g., Athalye, 1930, p. 281; Kuppuswami Sastri, 1932, pp. 188–189; Bocheński, 1956, pp. 497, 501; Goekoop, 1967, pp. 11–12, 56; Matilal, 1971, pp. 128–129). Others go out of their way to relate the Indian and the Aristotelian systems, and get wrapped up in greater confusions (e.g., Foucher, 1949, pp. 117–118; Barlingay, 1965, p. 109). The only scholar I found who seems to have had an inkling that these comparisons do not hold water, is Ingalls (1951, p. 35): though he uses the Western terms when introducing the Sanskrit ones, he remarks in a footnote: "Since the relation between s and h is one of pervasion, h may be equal to s.... In such cases, it is only by an extension of the literal meanings that one can speak of 'major', 'middle' and 'minor' terms. This is one reason why I prefer to keep the Sanskrit names, 's', 'h', and 'p'" (*ibid.*, note 28). But the assumption underlying this

observation is incorrect: Aristotle does consider cases where the middle and major terms are equal[3].

Turning now to Stcherbatsky we meet with a weird mixture that seems to have nothing whatsoever to do with logic. Though Stcherbatsky's translations are on the whole quite literal and reliable, his interpretations and explanations are often extremely confused and almost always unclear. The Indian distinction between *svārthānumāna* 'inference for one's own sake' and *parārthānumāna* 'inference for the sake of others' is expressed and interpreted by Stcherbatsky by calling the second kind of inference, but not the first, 'syllogism'. Stcherbatsky is of course well aware of the Aristotelian and traditional connotations of that term. In fact, he says: "We have given the name of Syllogism to inference 'for others' because of its outward similarity with Aristotle's First Figure" (I 278; the other figures need not detain us, he says, they are 'false subtlety' anyway: I 309). As a result, chapter II of part III, which explains inference, is relatively free from Aristotelian (though not from Kantian) bias. But chapter III of part III, which deals with 'syllogism', though clearly enunciating one of its basic characteristics ("It thus consists of a general rule and its application to an individual case": I 279), uses the expressions minor, middle and major in a very confusing manner, applying 'minor' and 'major', as in traditional logic, to premisses as well as to terms.

The second volume of Stcherbatsky's *Buddhist Logic* contains the translation of Dharmakīrti's *Nyāyabindu*. In the translation of the third *pariccheda*, which deals with the *parārthānumāna* 'syllogism', many inferences are interpreted in terms of a major premiss, an example, a minor premiss and a conclusion. Though this forces the meanings of the original expressions into a very badly fitting straight-jacket, I shall confine myself to the treatment given to the concept of *pakṣa*. When this concept is introduced in the second *pariccheda*, Dharmakīrti does not refer to it by the term *pakṣa*, but by its predecessor, the term *anumeya*. Stcherbatsky translates the latter term as 'the object cognized by inference' and identifies it with the minor. In the section entitled 'Minor term', he translates the definition of *anumeya* (*anumeyo'tra jijñāsitaviśeṣo dharmī*) correctly as:

"The object cognized in inference is here the substratum whose property it is desired to cognize." The term 'substratum' (*dharmin*) refers here to the locus, which has for its property (*dharma*) or specification (*viśeṣa*) the *sādhya* which occurs in it, so that the relation:

(8)   *A (sā)dhya, anumeya)*

 holds.

Now it is clear that the expression (8) refers itself to the conclusion of the inference. The commentary of Dharmottara on this definition reveals a certain ambiguity of the term *anumeya* as used in this context. In Stcherbatsky's translation: "The word *here* means that the object of inference appears as a substance (a substratum) when the definition of its mark is considered (the mark being an attribute of this substance). But from another standpoint, when the deduced (conclusion) is realized, the subject of the inference would be a complex (idea of the substratum together with its property). And when the invariable concomitance (between the middle and the major terms) is considered, then the inferred fact appears as an attribute (of this substance, as the major term). In order to point out (these differences) the word *here* has been used. We call *object of inference* an object whose property, or specification, it is desired to cognize" (II 58) (*atra hetulakṣaṇe niścetavye dharmy anumeyaḥ / anyatra tu sādhyapratipattikāle samudāyo'numeyaḥ / vyāptiniścayakāle tu dharmo'numeya iti darśayitum atra grahaṇam / jijñāsito jñātum iṣṭo viśeṣo dharmo yasya dharmiṇaḥ sa tathoktaḥ*).

Stcherbatsky attaches a footnote explaining *anumeya*: "In a general sense it may mean an object which possesses the united properties of the major, the minor and the middle terms, e.g., 'the mortal man Socrates'; it is then *ekam vijñānam.* It may also mean the major term or the conclusion separately, as well as the thesis which is also the conclusion (=*pakṣa* = *sādhya*). In a special sense it means the minor term, the subject of the conclusion, and even more precisely, the underlying substratum (*dharmin*), the efficient point-instant, that underlying point of reality upon which any

amount of interconnected qualities may be assembled as a superstructure" (*ibid.*, note 1).

Such muddles do not help the understanding of Indian logic. In fact, no logician who reads them can fail to lose whatever regard he might ever have had for that subject. And yet, Stcherbatsky was partly correct in his interpretations. The confusion is partly due to the Indian logicians themselves, and the rest results from imposing upon their expressions an Aristotelian framework that has nothing to do with it. The ensuing jumble may be sorted out and clarified along the following lines.

As we have seen, the conclusion of an Indian inference may be expressed by $A\,(s,\,p)$ (8). Now Dharmottara referred to three things that may be called *anumeya* in this conclusion because each of them may be used to express what it is that is concluded: the *dharmin p*, which has *s* for its property: the *dharma s*, which *p* has for its property; and the complex (*samudāya*) of the *dharmin* together with its *dharma*. The reason for this undecidedness is that the Buddhist logicians failed in this context to properly express that the conclusion is the *relation A* (*s, p*): they confined themselves to expressions denoting terms and 'complexes' of terms. Stcherbatsky compounded this error by imposing the Aristotelian framework he had adopted, and so came to speak of a term in the inference which may be either the major or the minor – as if such a terminology should ever be introduced for any other reason than in order to distinguish between the two. The two facts that the terms *sādhya* and *pakṣa* are used by Indian logicians in such a way that either of them can be used to state the conclusion, and that this was done without the entire edifice falling to pieces, should have alerted Stcherbatsky that these terms could not possibly denote the same concepts as the Aristotelian major and minor terms.

Though the Buddhist logicians did not clearly express the relational character of the conclusion of the inference in the contexts in which they introduced and discussed terms such as *hetu, sādhya* and *pakṣa*, they did so in other contexts. But to confuse matters again, they there refer to this relation by the term *pakṣa*. Accordingly, *pakṣa* refers sometimes to *p*, and sometimes to $A\,(s,\,p)$. This is not as strange as it may seem, though it is

certainly bad logic. The occasional confusion between a term and a sentence is not uncommon in Indian logic, and it is undoubtedly related to the structure of the Sanskrit language, where a certain type of expression can either refer to a noun or to a sentence (cf. Staal, 1965, p. 181; 1971, p. 200). Thus, *parvato vahnimān* can mean either 'the mountain possesses fire' or 'the mountain which possesses fire'; and this may depend on the context. A more accurate way of expressing the fact that the term *pakṣa* is ambiguous in this way, is by saying that it refers either to *A* (*s, p*), or to *¡pA* (*s, p*), which may be read as: 'that *p* such that *A* (*s, p*)' (rather than just *p*).

Stcherbatsky does not explicitly refer to this distinction, but he implicitly distinguished between the two meanings by translating *pakṣa* sometimes as *subject* (or similar terms, in the contexts already referred to) and sometimes as *thesis*. The latter translation is adopted in II 153 and following, where he deals with the definition of *pakṣa* in the *Nyāyabindu*. Later scholars have felt this same ambiguity. For example, Tachikawa writes in the notes to his excellent translation of the *Nyāyapraveśa*: "According to the definition given by Śaṅkarasvāmin, the *pakṣa* is an object which the arguer wishes to prove to be qualified by a property, not the statement of the form: A property-possessor is qualified by a property. The statements, however, are here taken as examples of the *pakṣa*, which seems to indicate some laxity in the usage of the term *pakṣa*" (Tachikawa, 1971, 132, note 9)[4].

The *Nyāyapraveśa* of Śaṅkarasvāmin contains yet another use of *pakṣa*, interesting especially because the ambiguity of the Sanskrit original is resolved in the Chinese translation. Tachikawa renders the relevant passages correctly but has to resort to rather free translations. In these contexts, the term *pakṣa* refers to what the *sapakṣa* and the *vipakṣa* have in common. This can of course be said to be *pakṣa* from a morphological point of view, if the terms are taken to be mentioned, not used. But the meaning of the term which is thus constructed does not correspond to the more common meanings of the term *pakṣa* in Indian logic. In fact, what *sapakṣa* and *vipakṣa* have in common excludes what is ordinarily called the *pakṣa*. For *sapakṣa* is defined as any locus, *different from the pakṣa*, where the *sādhya*

occurs; and *vipakṣa* as any locus where the *sādhya* does not occur (see Staal, 1962, 634–635).

This special sense of *pakṣa* occurs first in the discussion of a reason (*hetu*) which is fallacious because it is common to both the *sapakṣa* and the *vipakṣa*. An example is: 'sound is permanent because it is an object of valid cognition' (*śabdaḥ prameyatvān nityaḥ*: Tachikawa, 1971, 124, 142). Here the *hetu* is fallacious 'because the property of being an object of valid cognition is common to both permanent and impermanent things' (*nityānityapakṣayoḥ sādhāraṇatvād*). In other words, since both permanent and impermanent things can be known (everything can be known in the Nyāya view), it is not proper to conclude that sound is permanent from the fact that it can be known.

The Chinese translators render *sapakṣa* and *vipakṣa* each by a combination of two characters. The two pairs have one character in comomn, which is however different from the character used to translate *pakṣa*. This particular structure enables the Chinese translators to avoid the ambiguity of the Sanskrit original. Thus in Hsüan Tsang's translation of the *Nyāyapraveśa*, entitled 因明入正理論 (*Yin ming ju cheng li lun: T*, 1630, Vol. 32, 11a ff.), *pakṣa* is rendered by 宗, *sapakṣa* by 同品 and *vipakṣa* by 異品. But in the above passage, translated as 常無常品皆共此因 (T.1630, 11c: 20), the term *pakṣa* is rendered by 品, the character which the expressions for the *sapakṣa* and the *vipakṣa* have in common.

Thus the Chinese translation avoids the confusing ambiguity of the original and expresses its logical structure more adequately. This should come as a surprise to those who maintain that the Chinese translators did not appreciate the subtler points of the Sanskrit originals, but merely replaced words by characters in a mechanical manner, the results being fit for recitation and perhaps meditation, but not susceptible to further rational analysis. In this instance, at least, Hsüan Tsang's translation is decidedly superior to many of the modern translations I have been concerned with in

the above attempt to clear some of the interpretative jungle that surrounds the concept of *pakṣa* in Indian logic.[5]

NOTES

[1] The translation 'inferendum' was suggested to me by Mr. Paul Z. Panish.

[2] Aristotle gives different definitions in different contexts, and the definitions given for the first figure do not apply to the others. See Łukasiewicz (1957) pp. 28–82 and Patzig (1959) = Patzig (1968), Chapter IV.

[3] In *An. pr.* B5, 75b 35 ff. and in *An. post. A*3, 73a 6ff., Aristotle considers arguments where all three terms are convertible with each other, which is at least as strong a claim as that of extensional equality.

[4] The same 'laxity' is present when Tachikawa takes *pakṣa* to be the sense of *sādhya* in *anitye śabde sādhye* (Tachikawa, 1971, p. 132, note 9).

[5] I am very grateful to Professor Lewis R. Lancaster with whom I taught a seminar on the *Nyāyapraveśa* and who initiated me into the intricacies of its Chinese translation, and to Professor Michael Frede who improved my account of Aristotle's logic and provided the references in note 3.

Negation and the Law of Contradiction in Indian Thought: A Comparative Study

J. F. Staal

IN the fourth chapter of book *Γ* of the *Metaphysica* Aristotle deals with the principle of contradiction. This law is formulated as follows: 'it is impossible for anything at the same time to be and not to be'.[1] Let us imagine, says Aristotle, that somebody wished to oppose this view. Our opponent cannot hold a view which contradicts the law of contradiction without assuming the validity of this law itself: for otherwise he is not even denying what we are saying. The only alternative for him, then, will be to say nothing. But this is absurd: 'for such a man, as such, is from the start no better than a vegetable'.[2]

We are often told that Indian philosophers do not accept the law of contradiction. This may well be one of the causes of the neglect of Indian thought by Western philosophers: for nobody desires to study a body of propositions when he is at the same time told that their contradictories may hold as well. Is it perhaps a new—and according to some superior—kind of logic to which we are invited to accustom ourselves? Many may not feel the need for what would amount to a radical conversion. Nevertheless such a requirement seems implied in statements like the following, where a Western scholar speaks about principles such as the law of contradiction: 'But the Eastern mind is convinced that, taking together all the circumstances in which we need our thinking to give us adequate guidance, it would be fatal to allow ourselves to be enslaved by these principles'.[3] After stating this the author goes on to quote a Buddhist principle which indeed

contradicts the law of contradiction.[4] The question arises whether 'the Eastern mind' has in its entirety thrown the law of contradiction overboard.

The aim of the present study is to see how Indian thinkers treat contradictions and what explicit rules are given for the treatment of contradictions. If Indian philosophers are either unaware of contradiction or deny the validity of the principle of contradiction, the structure of Indian logic would seem to be so fundamentally different from the structure of Western logic, that the possibility of mutual understanding may become questionable. If, on the other hand, the principle of contradiction is either applied implicitly or laid down explicitly, this may be variously interpreted: there may be historical connexions between India and the West which account for certain influences; there may be a connexion between the logical law and the structure of Indo-European, manifest in both Greek and Sanskrit; there may be a general linguistic background to the law of contradiction; or finally, the law may be a universal logical law—whatever that may mean. A discussion of the question, whether Indian philosophers are to be considered vegetables, may therefore constitute a chapter of comparative logic.

The Sanskrit term which seems to correspond most closely to the Western term contradiction is derived from a root *sidh*-meaning 'to keep away'. The noun *sedha* derived from this root denotes 'keeping away', and the nouns *niṣedha* and *pratiṣedha* have a similar meaning, which can be sometimes further specified as 'prohibition, negation'. The latter term leads to the formation of the noun *vipratiṣedha* meaning 'mutual prohibition' or 'contradiction'.

An early technical or semi-technical use of the term *vipratiṣedha* occurs in Āpastamba's *Śrauta-sūtra* (between 400 and 200 B.C.), where during the offering the Vedas are assigned to the various sacrificers in the following manner[1]: 'The *hotṛ* sacrifices with the Ṛgveda; the *udgātṛ* with the Sāmaveda; the *adhvaryu* with the Yajurveda; the *brahman* with all. When it is expressly said, or in case of contradiction (*vipratiṣedha*), another (priest) may sacrifice'. Instead of *vipratiṣedhāt* the partly parallel text of Hiraṇyakeśin's *Śrauta-sūtra* has *asaṃbhavāt* 'if it is impossible'. Both

passages refer to cases where a priest is unable to sacrifice in accordance with what is prescribed for him on account of one rule or one established practice, because he is already engaged on account of another rule or other rules.[2] The last *sūtra,* therefore, formulates a principle which holds in cases of mutual contradiction between two rules applicable to the same situation. It is a rule for the manipulation of other rules, a *paribhāṣā* 'meta-rule', and it is accordingly placed in the last part of the *Āpastamba-śrauta-sūtra,* which consists of the *yajña-paribhāṣā-sūtrāṇi* 'meta-rules regarding the sacrifice'. The term *vipratiṣedha* is a term which applies to the contradictions between formulated rules, and not for instance between entities.

It is characteristic for Indian thought that at an early stage of development the distinction between language and meta-language was made. This is connected with the fact that the subject-matter for various kinds of investigations was a large body of linguistic material, the Vedic texts which were considered transcendent and revealed (*śruti*). The *sūtra* literature on the one hand embodies Vedic passages and continues to prescribe forms of activity in a Vedic fashion, and on the other hand interprets Vedic passages. This literature therefore does not only deal with ritual activity, but deals also with statements regarding ritual activity. In the first respect it constitutes a language dealing with the ritual as object material, in the second respect it constitutes a meta-language dealing with the language which deals with the ritual. The *paribhāṣā* rules, more specifically, were explicit meta-linguistic rules for the manipulation of Vedic passages.

With the development of grammar there is a shift in two respects. On the one hand the object material is new: it is neither the ritual, nor Vedic passages dealing with the ritual, but it is the spoken language (*bhāṣā*) and, to a limited extent, the Vedic language (*chandas*).[1] On the other hand it is not Vedic passages, but the rules of grammar themselves which are the subject of a meta-linguistic investigation. The same term, *paribhāṣā,* applies to rules of this meta-language. The importance of these meta-rules increases when the rules of the grammar of Pāṇini are accepted as authoritative.

In dealing with linguistic problems the grammatical description is mainly confined to the analysis of words (*pada*) and grammar has therefore been called *pada-mīmāṃsā* 'investigation into words'. While it is sometimes rightly stressed that the Sanskrit grammarians neglected or paid little attention to syntax, it is not always realized that grammar was in this respect supplemented by the *vākya-mīmāṃsā* 'investigation into sentences', another name for the most orthodox among the systems of philosophy, more generally known as Pūrva-mīmāṃsā, Karma-mīmāṃsā, or merely Mīmāṃsā.[2] Some syntactical principles of Mīmāṃsā will occupy us here. This philosophical system is the direct successor to the *sūtra* literature, for it systematizes the interpretation of Vedic sentences and evolves general canons of interpretation.[3] Also here general rules of a meta-linguistic nature, dealing with the interpretation of Vedic statements, are given. Such meta-rules are often called *nyāya.* These rules are further used and developed in *dharmaśāstra.* The term *nyāya* is later commonly used to denote logic and the system of logic. We have emphasized elsewhere that the early use of the term *nyāya* as synonymous with *paribhāṣā* may be an indication that elements and laws of Indian logic can be traced back to the discussion on problems of language and meta-language in earlier systems and especially in grammar.[4]

Problems of contradiction are dealt with in this meta-linguistic context in grammar as well as in Mīmāṃsā.[1] Pāṇini (*c.* 350 B.C.) gives the following meta-rule: 'in case of contradiction (between two rules) the later (rule) is to be applied'.[2] Here 'later rule' denotes a rule which occurs later in the sequence of rules in Pāṇini's grammar.[3] Patañjali (? second century B.C.) discusses this *sūtra* in the *Mahābhāṣya*[4] and pays special attention to the term *vipratiṣedha.* After giving the etymology he explains it by *itaretara-pratiṣedha* and *anyo'nya-pratiṣedha* 'mutual prohibition'. He proceeds to quote the following *vārttika: dvau prasaṅgāv anyārthāv ekasmin sa vipratiṣedhah* 'if two rules with different meaning apply to one (word) this is *vipratiṣedha*'.[5] He adds that this application should be possible 'at thé same time'(*yugapad*) and gives the following example. According to Pāṇini, 7.3.102, long *ā* is substituted for final *a* of a nominal stem before

terminations beginning with *y* or *bh*.[6] This enables us to form *vṛkṣāya* 'to the tree', *vṛkṣābhyām* 'to both trees', and apparently **vṛkṣābhyaḥ* 'to trees', from the nominal stem *vṛkṣa-* 'tree'. The following *sūtra,* 7.3.103, prescribes the substitution of *e* for this *a* before a plural termination beginning with *bh* or *s*. This accounts for the formation of *vṛkṣeṣu* 'among trees'. But as *-bhyaḥ* is a plural termination, the second *sūtra* applies also to this case and enables us to form *vṛkṣebhyaḥ* 'to trees'. The two rules form in this respect a *vipratiṣedha* 'contradiction'. Then, according to the *paribhāṣā*, as the second rule comes after the first, the second prevails and *vṛkṣebhyaḥ* is explained while **vṛkṣābhyaḥ* is not. We are perhaps inclined to regard the second rule as an exception (*apavāda*) to the first, but this does also produce the same result: for there is a *paribhāṣā* which states that the exception is stronger than the general rule.[7]

The above discussion can be formalized along the following lines. Let the *sūtras,* which are propositions, be ordered (as they are in Pāṇini) and be denoted by ϕ_1, ϕ_2, ..., and let $\phi_i < \phi_j$ denote that ϕ_i precedes ϕ_j in this list.[8] In addition let $\phi_i \mathbf{o} \phi_j$ denote that ϕ_i and ϕ_j are contradictory propositions. Now Pāṇini's propositions generally deal with linguistic predicates F(x), G(x), ... which have individual words or other sounds x, ... as their values.

As most rules state that a certain predicate holds under certain conditions, we may consider all and only those ϕ_i which can be written in the form:

$$(x) [F_i(x) \rightarrow G_i(x)]. \tag{1}$$

According to the definition of *vipratiṣedha*, $\phi_i \mathbf{o} \phi_j$ if and only if:

$$\sim (Ex) [G_i(x) \wedge G_j(x)]. \tag{2}$$

The *paribhāṣā* states (in the following formula connectives and parentheses are printed in bold face in order to denote that they are used in the formalization of the meta-theory):

$$\mathbf{[} \, \mathbf{(} \, \phi_i < \phi_j \, \mathbf{)} \, \boldsymbol{\wedge} \, \mathbf{(} \, \phi_i \, \mathbf{o} \, \phi_j \, \mathbf{)} \, \mathbf{]} \boldsymbol{\rightarrow} \phi_j \, . \tag{3}$$

This *paribhāṣā* presupposes an actual contradiction. For (3) is only meaningful if ϕ_i and ϕ_j apply to the same case, i.e. if:

$$(Ex)\ [F_i(x) \wedge F_j(x)]. \tag{4}$$

However, (4) and (1) yield:

$$(Ex)\ [G_i(x) \wedge G_j(x)], \tag{5}$$

which contradicts (2). Then, if $\phi_i < \phi_j$, we derive from (3) the proposition ϕ_j or: $(x)\ [F_j(x) \rightarrow G_j(x)]$. As there is an x such that $F_j(x)$ according to (4), we can derive $G_j(x)$ for that x.

This argument depends on a contradiction which is assumed to hold between (2) and (5), i.e. on a law of contradiction for propositions of the form:

$$\sim (\phi \wedge \sim \phi). \tag{6}$$

The analysis therefore shows what the formulation of the *paribhāṣā* already suggests, namely that the argument presupposes the validity of the principle of contradiction.

The *Kāśikā*,[1] a later commentary (seventh century A.D.) on Pāṇini's grammar defines *vipratiṣedha* in the same way, having first characterized it as *tulya-bala-virodhaḥ* 'opposition (between two propositions) of equal force'. The same definition is given by Uvaṭa in his commentary on the *Vājasaneyi-prātiśākhya*.[2] The term *virodha*, which according to the above definition has a wider denotation than *vipratiṣedha*, is also utilized for contradictions between two possible interpretations in the *sūtra* literature.[3]

In Mīmāṃsā, where the same *paribhāṣā* holds,[4] both *niṣedha* and *pratiṣedha* denote 'prohibition'. As in India the science of grammar is primarily descriptive and not prescriptive,[5] the grammatical *sūtras* are propositions where the verb occurs in the *indicative* mood or the construction is purely nominal. Mīmāṃsā, on the other hand, is primarily concerned with Vedic injunctions which contain a verb in the *optative* mood. The principal part of such an injunction is the optative verb form, and the principal part of the optative verb form is the ending, not the verbal root.

This doctrine is first formulated for positive injunctions (*vidhi*), but is subsequently transferred to negative injunctions or prohibitions. Such a view can be arrived at on account of the use of prohibitions such as *na bhakṣayet* 'he shall not eat', which in English should be interpreted as 'he shall-not eat', not as 'he shall not-eat'. Such a negative injunction does not enjoin an action which is not-eating, i.e. any definite action different from eating, but it prohibits eating.[1]

This distinction is interesting and seems to go a step beyond the Aristotelian doctrine of negation which is at the base of the modern logical notation. Aristotle evolved a theory of negation for propositions which will be called 'the original doctrine of negation'. This theory was extended in one direction to quantified sentences, thus arriving at the distinction between contrary and contradictory, and in another direction to modal propositions. The philosophers of the Mīmāṃsā system extended a similar underlying doctrine of negation to a class of non-indicative propositions, namely injunctions. To express this precisely and formally we shall need a special notation, which may be arrived at by first considering Aristotle's extensions.

In the *De interpretatione* Aristotle gives the original doctrine of negation. He says that the negation of 'man walks' (τὸ ἄνθρωπος βαδίζει) is not 'not-man walks' (τὸ οὐκ ἄνθρωπος βαδίζει), but 'man does not walk' (τὸ οὐ βαδίζει ἄνθρωπος).[2] This is reflected in the modern notation, where the negation of F(x) is not defined as F(~ x), but as ~ F(x).[3] The latter expression is in modern logic formed according to rules of formation so that it means ~ [F(x)]. Other expressions such as (~F) (x) are not defined and can only be expressed adequately when use is made of Church's λ-operator (e.g. [~ λx.F(x)](x), provided the negation sign is defined in this context).

In the theory of quantified sentences we arrive at contradictories (ἀντικειμένα) if the quantifier is negated, and at contraries (ἐναντίαι) if the copula, i.e. the verb, is negated.[4] This can be formalized along Aristotelian lines by considering the four kinds of quantified sentences as follows:

$$\text{SaP} \qquad (x)F(x) \tag{7}$$

$$\text{SeP} \qquad (x) \sim F(x) \qquad \text{or:} \quad \sim (Ex)F(x) \tag{8}$$

$$S_iP \qquad (Ex)F(x) \tag{9}$$

$$S_oP \qquad (Ex) \sim F(x) \qquad \text{or}: \quad \sim (x)F(x) \tag{10}$$

Here (7) and (10) are contradictories, (8) and (9) are contradictories, (7) and (8) are contraries, and (9) and (10) are contraries (traditionally, subcontraries).

In Aristotle's modal logic a detailed theory is given for the relationship between negation and the four modal functors.[5] It is not explicitly stated what is the negation of the individual modal functors, for example the negation of the necessity functor N[F(x)] 'it is necessary that F(x)'. Hence it is uncertain whether this negation should be interpreted as ~ N[F(x)] 'it is not necessary that F(x)' or as N[~ F(x)] 'it is necessary that ~ F(x)'. Aristotle implicitly accepts the first alternative, so that ~ N[F(x)] actually seems to denote (~ N)[F(x)]. It is obvious that special formation rules would be needed if this situation were to be fully expressed.

The Mīmāṃsā thinkers consider exactly this question. Let the injunction 'he shall eat', which can be considered derived from the proposition 'he eats', be denoted by N[F(x)], where F(x) denotes 'he eats'. This formalization is suggested by the fact that an injunction 'he shall eat' can under certain circumstances be interpreted as a necessary sentence 'it is necessary that he eats'. The Mīmāṃsā doctrine then states that a prohibition (*niṣedha*) or the negation of an injunction N[F(x)] is not N[~F(x)] but ~ N[F(x)], just as the negation of 'he shall eat' is not 'he shall not-eat' but 'he shall-not eat'. Here also ~ N[F(x)] denotes (~N)[F(x)]. The formation rules required here presuppose that along with the injunctive functor N a prohibitive functor (~ N) has been introduced at the start. This requirement is fulfilled in Mīmāṃsā, where the Vedic utterances are initially subdivided into five groups, including along with *vidhi* 'injunction' also *pratiṣedha* or *niṣedha* 'prohibition'.[1]

The question arises whether any meaning is to be attached to the expression N[~ F(x)], just as it is not impossible to conceive that a meaning could be attached to the expression F(~ x), which in modern logic is not a well-formed expression. The Mīmāṃsakas denote all cases of a negation of

an injunction which are not *pratiṣedha* or *niṣedha* by the term *paryudāsa* which is generally translated as 'exclusion'. Their main doctrine in this respect is succinctly expressed in the following verse, where the negative is denoted by *nañ:*

> *paryudāsaḥ sa vijñeyo yatro'ttarapadena nañ*
>
> *pratiṣedhaḥ sa vijñeyaḥ kriyayā saha yatra nañ*

'exclusion (*paryudāsa*) is to be understood where the negative (is connected) with the next word[2]; prohibition (*pratiṣedha*) is to be understood where the negative (is connected) with the verb(al ending)'.[3]

There are two kinds of 'next words' with which the negative can be connected: (1) a verbal root; (2) a noun. We shall consider each of these two shortly.

(1) There are sentences[4] such as *nekṣeta* 'he shall not look' where nothing can be prohibited because the sentence is introduced as a positive injunction by a kind of injunctive functor, e.g. because the words are preceded by the phrase *tasya vratam* … 'his vows are …'. Such a sentence positively enjoins something opposed to looking (*īkṣaṇa-virodhī*), which can be formulated by means of the expression 'not-look'(*nekṣe*, i.e. in Edgerton's words 'the combination *nekṣeta* "he shall not look" minus the optative ending').[1] This is expressed by the formula N[~ F(x)], where ~ F(x) denotes 'not-look'.

(2) There are also sentences of quite a different type, where a noun (or, in logic, a term) is negated,[2] for example *nānuyājeṣu yeyajāmahaṃ karoti* 'not at the after-sacrifices does he say *ye-yajāmahe*'. Here the context shows that this does not mean *anuyājeṣu yeyajāmahaṃ na kuryāt* 'at the after-sacrifices he shall not say *ye-yajāmahe*', but it means *anuyājavyatirikteṣu yeyajāmahaṃ kuryāt'* at sacrifices other than the after-sacrifices he shall say *ye-yajāmahe*'. This can only be expressed formally if the injunction is not derived from a predicate but from a relation, for instance F(x, y) denoting: 'at the after-sacrifices (x) he says

ye-yajāmahe (y)'. Hence the injunction can be written as N[F(x, y)] and this kind of negation or *paryudāsa* as N[F(~ x, y)], which again is a positive injunction.

In grammar an analogous distinction is made.[3] Exclusion and prohibition are respectively called *paryudāsa-pratiṣedha* and *prasajya-pratiṣedha*,[4] and an almost identical verse is quoted:

> *paryudāsaḥ sa vijñeyo yatro'ttarapadena nañ*
>
> *prasajyapratiṣedhas tu kriyayā saha yatra nañ.*

Renou, who mentions this verse, quotes the following example from the *Nyāsa* of Jinendrabuddhi (? eighth century A.D.).[5] The interpretation of the negative prefix *a*-in the word *a-kartari* occurring in Pāṇini, 3.3.19, *akartari ca kārake saṃjñāyām,* is under discussion. If this negation is interpreted as *paryudāsa* the meaning would be '(The suffix *ghañ* is applied) to case relationships different from the nominative'. If the negation is interpreted as *prasajya* the meaning would be '(The suffix *ghañ* is) not (applied) to the nominative (but is applied) to case relationships'. The first interpretation should be rejected, for the nominative is a case relationship and the word *kāraka* 'case relationship' would hence be superfluous, which conflicts with a well-known economy criterion.[1]

The difference between on the one hand the grammatical distinction between two types of negation and on the other hand the Mīmāṃsā distinction between three types reflects the fact that grammar is descriptive and deals with propositions, while Mīmāṃsā is prescriptive and deals with injunctive functors. In formalizing the grammatical propositions, expressions of the type F(x) are sufficient and there is no need for an injunctive functor N. The above distinction could for instance be formalized by expressing the proposition 'the suffix *ghañ* (a) is applied to x' by F(a, x) and by abbreviating the nominative as n and a case relationship as c. Then the *paryudāsa* interpretation is given by:

$$F(a, c \land \sim n), \qquad\qquad (11)$$

while the *prasajya* interpretation is given by:

$$F(a, c) \wedge \sim F(a, n). \tag{12}$$

The second type of *paryudāsa* in Mīmāṃsā comes into being on account of the fact, that the negation can be attached to either N or F. This is impossible in grammar. The relation between Mīmāṃsā and grammar can be summarized in the following table, where the characteristic structure of each operation is given by means of a formal expression:

Mīmāṃsā	Grammar
vidhi: N[F(x)]	*sūtra*: F(x)
niṣedha: (~ N) [F(x)]	*prasajya-pratiṣedha*: ~ F(x)
paryudāsa II: N[F(~ x)]	*paryudāsa-pratiṣedha*: F(~ x)
paryudāsa I: N[(~ F)(x)]	_____

The Mīmāṃsā concepts of *niṣedha* and of two types of *paryudāsa* constitute a logical system of negations which is quite different from the Aristotelian doctrines of negation which are at the base of modern formulations and also of the modern symbolical notation. We have seen that the formation rules which express the structure of the modern notation and determine whether an expression is well-formed or not, depend on Aristotle's analysis of negation. It is important to realize that these differences in logical structure between India and the West do not imply and are not implied by similar differences in the *total* linguistic structure of the languages in which the logical doctrines were evolved. The linguistic background of the Indian concepts in Sanskrit is quite expressible and intelligible in, e.g., Greek or English. This may go far to show that logical doctrines may have been evolved along the lines suggested by various *partial* structures of ordinary language. The limitations of logical systems, Western as well as Indian, can be studied when it is precisely known which linguistic structure of a language system is at the background of a particular logical system.

In the present context this may be illustrated by writing in a table: A, the name of the operation concerned; B, the formal expression for it; and C, the

linguistic structure to which it is related, as exemplified by a simple English sentence:

A	B	C
	F(x)	the door is locked
vidhi	N[F(x)]	the door should be locked
niṣedha	(~ N)[F(x)]	the door should not be locked
paryudāsa I	N[(~ F) (x)]	the door should be unlocked
paryudāsa II	N [F(~ x)]	another door should be locked

While we find in the Mīmāṃsā doctrines a very refined theory of the negation of injunctions, there is no discussion, apparently, of a principle of contradiction. At first sight the reason for this may seem to be that all injunctions which Mīmāṃsā discusses are Vedic statements which are considered revealed texts (*śruti*), so that contradictions are *a priori* excluded. The Mīmāṃsā position is similar to that of any other hermeneutic system of thought which attempts to reconcile a number of statements which are not necessarily compatible, such as some theological systems in the Western monotheistic religions. Historically this fact may partly explain the origination of certain logical doctrines concerning negation. But the inner structure of the logical concepts themselves explains the absence of a law of contradiction. This can be shown for each of the negations considered earlier. In terms of Western logic we should be prepared to find:

$$\sim (N[F(x)] \wedge \sim \{N[F(x)]\}), \tag{13}$$

for this is nothing but a substitution result of the law of contradiction ~ (A ∧ ~ A). This is no compelling reason, however, to be certain that each of the following principles should hold:

$$niṣedha: \qquad \sim \{N[F(x)] \wedge (\sim N) [F(x)]\} \tag{14}$$

$$paryudāsa\ I: \qquad \sim \{N[F(x)] \wedge N[(\sim F)(x)]\} \tag{15}$$

$$paryudāsa\ II: \qquad \sim \{N[F(x)] \wedge N [F(\sim x)]\}, \tag{16}$$

for these cannot be all considered direct substitution results from ~(A ∧ ~A). That (16) need not be valid is also intuitively clear. This may illustrate the special character of the negations considered here. For the proof of (14), (15), and (16) would depend respectively on proofs of the following three equations:

$$(\sim N) \, [\mathrm{F}(\mathrm{x})] = \, \sim \{N[\mathrm{F}(\mathrm{x})]\} \qquad (17)$$

$$N[(\sim \mathrm{F})(\mathrm{x})] = \, \sim \{N[\mathrm{F}(\mathrm{x})]\} \qquad (18)$$

$$N[\mathrm{F}(\sim \mathrm{x})] = \, \sim \{N[\mathrm{F}(\mathrm{x})]\}. \qquad (19)$$

If these could be proved, however, each of the three negations considered here would be identical with the Aristotelian negation.

While the law of contradiction need not necessarily hold for injunctions which are always injunctions enjoining action, the same law does hold for the results of the activities based upon these injunctions. In the Sanskrit terminology this can be expressed by saying that the law of contradiction need not hold in the realm of what is to be established (*sādhya*), but holds in the realm of what is established (*siddha*). The philosophers of the Uttara-Mīmāṃsā or Vedānta of the Advaita school rejected the Mīmāṃsā interpretation of all Vedic sentences as injunctions dealing with *sādhya.* These Vedāntins considered either all or at least some of the Vedic utterances as dealing with *siddha.* The law of contradiction, therefore, is accepted by the Advaitins for Vedic sentences. Within Indian philosophy this is an extremely important development: the consideration of certain authoritative statements, especially the 'great statements' (*mahāvākya*) in which the Advaitins are especially interested, as propositions, leads to the problem of how such propositions are related to the reality which they describe, and hence to the problem of truth. This is expressed in the Advaita doctrine that the truth regarding an object is 'dependent upon the object' (*vastutantra*).

In the following two passages of the *Brahmasūtrabhāṣya* of the famous Advaita philosopher Śaṅkara (eighth century A.D.) this topic is lucidly expounded. In the first[1] Śaṅkara stresses the fact that option (*vikalpa*) is possible with respect to injunctions only. Paradoxically these injunctions are

exemplified by sentences where the verb occurs in the indicative; but this is not essential, for philosophy may free itself from language and Śaṅkara explicitly speaks about *vidhi* and *pratiṣedha*. There is option, then, according to Śaṅkara, when we meet with positive and negative injunctions such as 'at the *atirātra* sacrifice he takes the *ṣoḍaśin* cup' (*atirātre ṣoḍaśinaṃ gṛhṇāti*) and 'at the *atirātra* he does not take the *ṣoḍaśin* cup' (*nātirātre ṣoḍaśinaṃ gṛhṇāti*); 'he sacrifices after the sun has risen' (*udite juhoti*) and 'he sacrifices when the sun has not yet risen' (*anudite juhoti*).[2] All such injunctions pertain to what is *sādhya*. He then continues: 'But there is no option as to whether a thing is thus or thus, is or is not. Option depends on human notions. Knowledge of the nature of a thing does not depend on human notions. It depends only on the thing itself. To say with regard to a pillar "it is a pillar or it is a man or it is something else" does not result from correct knowledge. To say that it is a man or something else does result from false knowledge. To say that it is a pillar results from correct knowledge, because it depends on the thing itself. Therefore the means of knowing objects, that are existent things, depend on the things themselves'.[3]

In a later passage the concept of knowledge (*jñāna*) is dealt with in a slightly different context, where Śaṅkara speaks about meditation (*dhyāna*), a mental activity which is based upon a special kind of *vidhi*. Knowledge which is expressed in propositions, for which the law of contradiction holds, is not contrasted with injunctions in general, but with meditation. In Advaita *jñāna* acquires the meaning of intellectual knowledge and Śaṅkara thus goes beyond the magical atmosphere of the Brāhmaṇa literature, where an important aspect of *jñāna* can be described as magical identification.[1] In the following passage[2] Śaṅkara has first quoted a *vidhi* which enjoins meditation and then continues: 'If meditation and reflection are mental activities, they can be performed, not performed, or performed differently by man, because they depend on man. But knowledge originates from the means of knowledge, which have as their objects things as they exist. Therefore knowledge cannot be performed, not performed, or performed differently, for it solely depends on the object. It does neither depend on authoritative statements, nor on man'.[3]

These passages show how Advaita constitutes in this respect a return from Mīmāṃsā to the grammatical doctrines.[4] The difference is, that in grammar the law of contradiction is immediately applied to propositions, while in Advaita the law of contradiction is said to hold for propositions because it holds in reality. Śaṅkara's logic is founded on his ontology. This difference partly reflects the different preoccupations of grammarians and philosophers. It shows incidentally that the Advaita position in philosophy is firmly realistic.[5] The linguistic background for both views is that grammarians as well as Advaitins are mainly interested in description and in propositions where the verb occurs in the indicative mood or where the sentence is purely nominal. The Mīmāṃsakas, on the other hand, are interested in prescription and in injunctions where the verb occurs in the optative mood.[6]

The grammarians, accordingly, do not use *vidhi* to denote positive linguistic propositions, but generally employ the term *sūtra* 'rule' and sometimes, more specifically, *utsarga* 'general rule'. The term used for negative linguistic propositions is, as we have seen, either *pratiṣedha* or *niṣedha*. These terms seem to have similar, but not identical functions to the Mīmāṃsā term for 'prohibition', reflecting a trend among the grammarians which deviates from their customary stress on description and emphasis on empirically tested usage (*loka*). There are occasions where the grammarians actually prohibit the use of certain words, which may have been colloquial and which are referred to as *apaśabda* 'incorrect word'. In this connexion Patañjali propounds an interesting analysis of the relationship between positive and negative linguistic rules, which reflects the similar relationship between positive and negative ritualistic rules. The text is as follows[1]:

'Now words have to be examined. How is this to be done? Are (correct) words to be taught, or perhaps incorrect words, or perhaps both? Our purpose will be served by the teaching of either. Thus by a restrictive condition (*niyama*) on what food is fit to be eaten is implied a prohibition (*pratiṣedha*) of what food is not fit to be eaten. For example when we say "Five five-toed animals are fit to be eaten" it is implied that (five-toed animals) different from these are not fit to be eaten. Or alternatively, by a

prohibition of what is not fit to be eaten is implied a restrictive condition on what is fit to be eaten. For example when we say "the domestic fowl is not fit to be eaten, the domestic pig is not fit to be eaten" it is implied that the wild variety (of these animals) is fit to be eaten. This applies also in the present context. If the correct words are taught, for instance when the word *gauḥ* has been taught, it is implied that *gāvī,* etc., are incorrect words. If on the other hand incorrect words are taught, for instance when the words *gāvī,* etc., have been taught, it is implied that *gauḥ* is the correct word'.[2]

This passage gives interesting rules for *pratiṣedha* negations which are closely related to the law of double negation. If N [F(x)] denotes that F(x) is prescribed by means of a restrictive condition (*niyama*), the ritualistic rule first quoted can be written as:

$$N[F(x)] \longleftrightarrow (\sim N)F(\sim x), \qquad\qquad (20)$$

where F(x) denotes: *x bhakṣyam* 'x is fit to be eaten'. The examples which follow correspond to this rule and the grammatical rule can be given in the same form. In all cases Patañjali expresses equivalence by means of bi-conditionals.

That the grammarian concept of *pratiṣedha,* however, is not the same as the Mīmāṃsā concept is shown by Patañjali in another passage, where the law of contradiction is explicitly formulated in the following terms: *vidhipratiṣedhayor yugapad vacanānupapattiḥ* 'it is impossible for a statement to express simultaneously a *vidhi* and a *pratiṣedha*'.[1] This corresponds to:

$$\sim \{N[F(x)] \wedge (\sim N) [F(x)]\} \qquad\qquad (21)$$

and confirms the view that the grammarians, like the Advaitins, deal with indicative sentences, where the law of contradiction holds, while Mīmāṃsakas deal with injunctions, where the law of contradiction need not hold. In grammar, then, *vidhi* means rule or positive statement, and not injunction.

These passages enable us to see what is the precise structure of the negations concerned. If numerous texts of this type could be found and

analysed, it would enable us to construct complete lists of formation rules. In the present context our purpose is merely to draw attention to logical possibilities which are different from those generally considered and which show that both Western and Indian concepts of negation are the product of a particular development.

The law of double negation is explicitly given in the *Pradīpa* of Kaiyaṭa, a grammatical commentary of the eleventh century. It is formulated as follows: *pratiṣedhapratiṣedhād vidhir bhavati* 'the prohibition of a prohibition gives an injunction'.[2] This could probably be expressed by:

$$\sim \sim N[F(x)] \to N[F(x)] \qquad\qquad (22)$$

since: (~ N) [(~ N) F(x)] is not defined. The Sanskrit dictionary of V. S. Apte quotes a grammatical rule regarding the use of the particle of negation *na* which is also called *niṣedha.* The source is not given. The rule is: *dvau niṣedhau prakṛtārthaṃ gamayataḥ* 'two particles of negation give the meaning of the original'.[3] These formulations of the law of double negation precede by centuries the purely logical laws of double negation propounded in *navya-nyāya* and studied by Ingalls.[4]

We have seen that the grammarian and Advaitin doctrines of negation have a linguistic background in the structure of the indicative mood of the verb, while the Mīmāṃsā doctrine of negation has a linguistic background in the structure of the optative mood of the verb, which is reflected also in the imperative. The grammatical rule about two consecutive negative particles cancelling each other draws our attention to the linguistic background of the law of double negation. It is well known that in Indo-European two negatives can either cancel each other or supplement each other. This is a linguistic fact which can be observed in Sanskrit as well as in Greek. It is not very hazardous to assume that the cancelling particles of negation in ordinary language are at the background of the logical law of double negation.

Delbrück called the accumulative use of more than one negative particle 'Ergänzungsnegation' and gave examples from Sanskrit, Lithuanian, Slavonic, and Greek.[1] Accumulative negation is also often found in modern

languages.[2] It seems again likely that this use is at the background of the logical systems which reject the law of double negation, either in Navya-nyāya or in Intuitionism.[3]

The distinction between the negation of terms and the negation of sentences or predicates is also related to certain facts of language. It is well known that in Indo-European there are two forms of negation: sentence negation, expressed by *ne* (*nē*) and *mē,* and word negation, expressed by the so-called privative prefix.[4] Chinese has the analogous distinction between respectively *pu* and *fei*,[5] and A. C. Graham has quoted a passage where a law of contradiction is formulated in terms of the term negation *fei*.[6] Inspection of the Sanskrit passages discussed in the above shows that the sentence negation *na* is used in all cases. There is one case, however, where the privative syllable *a*(*n*)-could have been used. In this case negation of a term was used in the formalization despite the fact that this is not permitted in the customary notation of modern logic. Here, when the ambiguous use of the sentence negation *na* in *nānuyājeṣu* … 'not at the after-sacrifices …' is explained by *anuyājavya-tirikteṣu* 'at sacrifices other than the after-sacrifices', it would have been possible to explain this merely as *an-anuyājeṣu* 'at the "un"-after-sacrifices'. Though this form is not given in the text, the explanation given there confirms this view: 'because the negative (*nañ*) is combined with the word "after-sacrifices" (*anuyāja*) we have a case of *paryudāsa.* For the negative and the word after-sacrifices together denote what is other than the after-sacrifices'.[7]

Whenever the two negatives remain clearly distinct there is no danger of confusion and logicians can clearly distinguish between negation of terms and of predicates and study the relationships between both. Logical problems arise whenever the sentence negation is used or functions as word negation, and vice versa. In Indo-European both possibilities are realized, though infrequently. In Vedic *nákis* can mean 'nobody' ('not anybody'), but more often it merely means 'not' or 'never' and is applicable tó the whole sentence.[1] A similar transference of the sentence negative *na* to a term is found in the adverb *naciram* 'not long', which can be explained as a

development from sentences of the type *na ciraṃ vasati* 'he does not stay long'.[2]

The Sanskrit grammarians, on the other hand, mention a case where the privative syllable is attached to a verbal form, which thereby acquires a special meaning. This forms an exception to Pāṇini, 2.2.6, *nañ* 'the negative particle (combines with a noun)', and is given by the *Kāśikā* when commenting upon this *sūtra.* The form given is: *apacasi* 'you are a bad cook, you cook badly', from *pacasi* 'you cook'.[3] Pāṇini describes the word negation *a(n)*-as derived from the sentence negation *na* which loses its initial n.[4] While this is for Pāṇini a matter of descriptive grammar, it also holds historically.[5]

Aristotle in the sentences discussed earlier uses the Greek sentence negations *μή* and *οὐκ* (for Indo-European *ne*)[6] also for the negation of terms and nouns. Not only *τὸ μὴ ε⌣ίναι λευκόν*, but also *τὸ ε⌣ίνναι μὴ λευκόν*, and not only *τὸ οὐ βαδίζει ἄνθρωπος*, but also *τὸ οὐκ ἄνθρωπος βαδίζει*. It is not surprising, therefore, that Bocheński finds that Aristotle 'struggled hard with the initial confusion of the negation of a sentence with the negation of its terms'.[7] The Indian thinkers were used to the grammarian's distinctions and do not seem to have been similarly confused, as the Mīmāṃsā doctrines quoted above show. In addition Indian philosophers have always been used to dealing skilfully with negations. On the one hand a rich and ramified negative theology developed round the use of the sentence negative in passages such as the *mahāvākya* ('great statement') *neti neti* 'not thus, not so'.[8] On the other hand the negative prefix is used in many cases where Western thought seems inclined to employ a positive terminology.[9]

In Indian logic, lastly, extensive use is made of the prefix *vi*-which further specifies the function of the privative syllable *a(n)*-. The Buddhist logicians called *sapakṣa* any locus where the *hetu* 'reason' occurs. A locus where the *hetu* does not occur is called *asapakṣa,* later *vipakṣa.* Dharmakīrti (seventh century A.D.) formulates the relationship between these two terms by means of the quantifier *eva* 'only'. In his formulation 'occurrence of the reason in *sapakṣa* only' (*sapakṣa eva sattvam*) is equivalent to 'non-occurrence in *asapakṣa* of the reason only'(*asapakṣe cāsattvam eva*).[10] This

leads to the discovery of the law of contraposition and to further developments.[11]

The Indian logicians are mainly interested in contradiction in connexion with the doctrine of inference. Instead of the term *vipratiṣedha* or related terms, use is made of the terms *viruddha* and *virodhī*, which we have seen used as general terms applied to cases of opposition in grammar as well as in Mīmāṃsā. In the *Nyāya-sūtra* (? second century A.D.) a *hetu* 'reason' is called *viruddha* 'opposed', when it opposes a conclusion (*siddhānta*) which has been established.[1] Later, *viruddha* occurs among the fallacious reasons (*hetvābhāsa*) and a *hetu* is called *viruddha* if it is the opposite of the *sādhya* 'what is to be proved'. For example, the inference *śabdo nityaḥ kṛtakatvāt* 'sound is eternal because it is created' is invalid, for creation and eternity are each other's opposite.[2]

In Indian logic the law of contradiction is widely utilized, explicitly as well as implicitly. One of the most explicit formulations is due to Udayana (tenth century A.D.) and is quoted by D. M. Datta.[3] It runs as follows: *paraspara-virodhe na prakārāntarasthitiḥ* 'when two are mutually opposed there is no occurrence (of both) within the same class'.[4] Implicitly the principle of contradiction is presupposed in most of the logical discussions of *Navya-nyāya.* It becomes explicit when it is attempted to give a detailed formalization of logical arguments.[5]

The doctrines which have been discussed in this paper belong to numerous systems of thought and it would require much more space to study them fully within their own contexts. However, from the general logical viewpoint adopted here, the various interconnexions between the Indian systems on the one hand, and Aristotle on the other hand, have been more apparent than their divergent backgrounds. We have seen that in India, the law of contradiction is formulated and strictly adhered to in grammar, in Advaita Vedānta, and in logic. In Mīmāṃsā the law of contradiction is discarded.[6] The reason for this is not a mystical tendency, which rejects or merely neglects all intellectual distinctions, but a consistent unfolding of the implications inherent in a particular kind of negation. The law of contradiction is then seen to be dependent on the kind of negation which is

used in its formulation. Directing our attention to the different types of underlying negations, we have seen that these can be related to various negations used in ordinary language. These negations occur in Sanskrit as well as in Greek and in other Indo-European languages. The principal distinction is that between the negation of nouns and the negation of verbs, a distinction which also obtains in Chinese and probably in numerous other language types. In as far as syntax, logic, and philosophy are mainly interested in propositions or sentences, the negation of the verb, which generally constitutes the negation of the sentence itself,[1] is the most important negation in the present context. However, the verb possesses several moods and negative particles do not function in the same way in each of these. In particular, the negative particle is combined with the indicative (and therefore also with purely nominal sentences, which mostly have an indicative character[2]) in such a manner, that sentences with and without the negative particle exclude each other. This leads to the law of contradiction formulated in terms of indicative sentences. When the particle of negation is used with other moods, however, in particular with the optative or the imperative, sentences with and without negation do not function in this exclusive fashion. For such sentences, therefore, the law of contradiction need not hold. This is fully recognized in Mīmāṃsā, a system of thought which is mainly interested in injunctions generally formulated with the help of the optative mood of the verb.

We may now return to our point of departure. Aristotle's defence of the law of contradiction reflects the emphasis he lays upon indicative sentences. That Western logic has found it useful to develop further along similar lines is not surprising, for indicative sentences are those which are used in all descriptive systems, in particular in science. However, if the logical structure of prescriptive sentences had been studied in greater detail (a study which Aristotle had undertaken from a particular point of view in his modal logic), Western logic might have arrived at different doctrines of negation and contradiction in addition to the traditional Aristotelian doctrines. This was done in India in Mīmāṃsā and in the legal literature of *dharmaśāstra*, and to a limited extent in grammar. A similar development in Western logic

could have been equally useful in Western prescriptive sciences, for instance in law, in ethics, and, to a limited extent and from a particular point of view, in grammar.[1] The fact that this has not been done may account for the characteristically Western situation, where the sciences have evolved a logical structure which is far superior to the logical structure of, e.g., law or ethics. In India, on the other hand, Mīmāṃsā possesses in principle as scientific a structure as grammar or logic have. It could be said that in the West in general there is an over-emphasis on indicative sentences, which is similar to the often-stressed over-emphasis on the subject-predicate structure. In fact, the latter is mainly available within the framework of the former.

There is no need to explain the law of contradiction in Indian thought as the result of a possible Western influence. On the contrary, it reflects a use of negation which can be found in all Indo-European languages, and probably in many other languages. The last problem which may therefore be raised in this connexion is the Wittgensteinian problem of the relation between language and logic or between language and thought in general. Does the material discussed in the present paper give support, or provide counter-examples, to the thesis that thought depends on language?

In its original form this thesis, either in the manner in which it was analysed by Wittgenstein, or in the manner in which it was suggested by Whorf and by other linguists,[2] is almost certainly unverifiable. In addition Wittgenstein's own method, confined as it was to German and to English, could never attain a satisfactory degree of universality. It has therefore rightly been suggested that the thesis could be tested by the empirical study of linguistic material from divergent sources.[3] The present study, which was partly undertaken in a similar spirit, may show that we are only at the beginning of possibly extensive investigations into the relationships of particular logical, philosophical, and grammatical doctrines with particular linguistic structures of the languages in which they are expressed. These investigations may be particularly illuminating when comparative studies are made of the linguistic structure of a language, in which relatively highly developed logical, philosophical, and grammatical doctrines are available.

This requirement is obviously fulfilled in the case of Sanskrit and Indian thought, and it may to a smaller extent be fulfilled with respect to Chinese.

From this point of view the provisory results of the present paper can perhaps be formulated as follows. It could be shown, perhaps somewhat unexpectedly, that neither the linguistic structure of Sanskrit, nor that of Greek, leads to a particular logical structure. In a detailed investigation it makes no sense to speak of *the* structure of a language. It has been seen, however, that certain structures of language, which are available in Sanskrit, in Greek, and in other languages, are related to particular logical doctrines. The problem then becomes, to see which particular linguistic structure is related to which particular logical doctrine. In the present study some examples of such relationships have been given. On the basis of similar investigations it may be possible to reach more general conclusions.

Does this finally imply that logic or thought in general can be derived from language? The answer must, for the time being, remain uncertain, but we have no good reason as yet to believe that it might turn out to be in the affirmative. For language itself, in order to function, has to obey certain rules, some of which may be made explicit as syntactical rules. Such rules may also be reflected in logical rules and in rules of thought. But while logical rules cannot be reached and formulated without a linguistic background and without a linguistic framework, no language can function without a logical structure which is implicit in it.[1]

1 See, e.g., *Mīmāṃsā-nyāya-prakāśa,* section 10.

2 The term *uttarapada* literally denotes the second member of a compound. According to the Sanskrit grammarians the negative particle combines with a following noun into a nominal compound (generally either *tatpuruṣa* or *bahuvrīhi*), so that the following noun is appropriately designated by the term *uttarapada.* Since *paryudāsa* applies also to verbs, *uttarapada* has been here translated by 'next word'.

3 *Mīmāṃsā-nyāya-prakāśa,* section 330.

4 *Mīmāṃsā-nyāya-prakāśa,* sections 332–40.

1 Edgerton, op. cit., p. 170, n. 222.

2 *Mīmāṃsā-nyāya-prakāśa,* sections 341–50. These sentences reflect Vedic sentences where the second object follows the verb but is preceded by *na,* e.g. *Aitareya-Brāhmaṇa,* 1.17.13, *prayājān evātra yajanti nānuyājān* 'in this case they offer the fore-sacrifices, not the after-sacrifices'. See J.

Gonda, *Four studies in the language of the Veda*, 's-Gravenhage, 1959, 7–70 ('Amplified sentences and similar structures', 60).

3 The Mīmāṃsā distinction was also adopted in *dharmaśāstra*. It occurs in a medieval work on *gotra* and *pravara*: see J. Brough, *The early Brahmanical system of Gotra and Pravara: a translation of the Gotra-pravara-mañjarī of Puruṣottama-paṇḍita*, Cambridge, 1953, p. 70, n. 3.

2 *Brahmasūtrabhāṣya*, 1.1.4. Ed. Nirṇaya Sāgara, 83; discussed by the present author in *Advaita and neo-Platonism: a critical study in comparative philosophy*, Madras, 1961, 101–2, and cf. 80–1.

3 *dhyānaṃ cintanaṃ yady api mānasaṃ tathāpi puruṣeṇa kartumakartumanyathā vā kartuṃ śakyaṃ puruṣatantratvāt / jñānaṃ tu pramāṇajanyam / pramāṇaṃ ca yathābhūtavastuviṣayam / ato jñānaṃ kartumakartumanyathā vā kartumaśakyaṃ kevalaṃ vastutantram eva tat / na codanātantram / nāpi puruṣatantram //*

4 cf. Renou, *J A*, CCXXXIII, 1941–2, 115: 'le style nominal, représenté de façon rigoureuse par les sūtra grammaticaux et que reprendront les sūtra philosophiques, cède la place, dans le rituel, à un style verbal charactérisé par l'indicatif descriptif, l'optatif prescriptif, l'absolutif d'enchaînement temporel …'.

5 This holds on the *vyāvahārika* level. Śaṅkara's explicit statements are somewhat obscured in O. Lacombe, *L'Absolu selon le Védānta*, Paris, 1937, 124.

6 Brough, who rightly stressed this Mīmāṃsā preoccupation with injunctions, has also drawn attention to the fact that the terms *vidhi* and *pratiṣedha* came to refer to indicative sentences as well: 'although later Indian logic deals largely in indicative sentences, the linguistic thought of philosophers in India was not so strictly confined to indicative propositions as that of logicians in the west. This influence can be traced in the terms *vidhi* and *pratiṣedha*, originally meaning injunction and prohibition, but in later texts occasionally used to apply simply to positive and negative statements' (J. Brough, 'Some Indian theories of meaning', *TPS*, 1953, 162).

6 Since only the doctrines mentioned are dealt with in this paper, these conclusions do not imply that there are not also other systems where the law of contradiction is denied. Such systems exist

in Buddhism (see, e.g., p. 52, n. 4, above, and A. Kunst, 'The concept of the principle of excluded middle in Buddhism', *Rocznik Orientalistyczny*, XXI, 1957, 141–7) and in Jainism (especially in the opportunist *syādvāda* 'let-it-be doctrine'). In Hinduism such thought appears in particular in the Advaita doctrine of the indeterminability (*anirvacanīyatva*) of the world-illusion, which is specified as *sadasadbhyām anirvacanīya* 'indeterminable either as real or as unreal' (similarly: *sadasadbhyām vilakṣaṇa*). If this is interpreted as ~ (aV ~ a), it violates the law of contradiction. In Advaita the world-illusion is therefore *sarvanyāyavirodhinī* 'opposed to all logic' (*Naiṣkarmyasiddhi*, 3.66). These doctrines have been vehemently criticized in the name of logic and the law of contradiction both by Viśiṣṭādvaitins (see, e.g., S. N. Dasgupta, *A history of Indian philosophy*, III, Cambridge, 1952, 177), and by Dvaitins (see, e.g., Dasgupta, IV, Cambridge, 1955, 204; A. B. Shastri, *Studies in post-Śaṃkara dialectics*, Calcutta, 1936, 180, 195–6). The law of the excluded middle on the other hand seems to be accepted by the Advaitin Toṭaka who maintained that there exists no intermediary between *sat* 'being' and *asat* 'non-being' (see P. Hacker, *Untersuchungen über Texte des frühen Advaitavāda*, Mainz, 1950, 163). Whereas we have seen that Śaṅkara himself uses and accepts the law of contradiction, he can also be seen to argue in accordance with the law of double negation. An example occurs in *Brahmasūtrabhāṣya*, 4.1.3, where the conclusion, that the worshipper is not different from the deity, is drawn from a scriptural statement which opposes the negation of this view, i.e. 'Now if someone worships a deity as other, saying "the deity is one and I am another", he does not know' (*Bṛhadāraṇyakopaniṣat*, 1.4.10). Elsewhere Śaṅkara appears to refer implicitly to the law of contradiction when saying that different Vedānta texts cannot teach different cognitions of Brahman, for it is certain that, if at all they differ, 'only one of them is the right one, the others are erroneous' (*teṣām ekam abhrāntaṃ bhrāntānītarāṇī: Brahmasūtrabhāṣya*, 3.3.1; see J. F. Staal in *Atti del XII Congresso Internazionale di Filosofia*, 1958, X, Firenze, 1960, 227).

Indian Logic Revisited: Nyāyapraveśa Reviewed

Brendan S. Gillon and Martha Lile Love

INTRODUCTION

Indian logic is no better understood now by the modern mind than it was two thousand years ago when it first was taking shape. Today, those who contribute to the growing literature about Indian logic either recapitulate perfunctorily what is said by those who still engage in it, or interpret it gratuitously through concepts commandeered from mathematical logic. A new approach is desperately needed, if we are not to drown in a morass of erudite mathematical symbols and arcane Sanskrit texts.

In this essay, we hope to exhibit a new approach to Indian logic and to provide a rudimentary exposition of it. To do these two things, we have selected for exposition an elementary text taken from one tradition in the literature of Indian logic, the preponderance of which literature was produced by the adherents of Buddhism, Jainism, and Nyāya-Vaiśeṣika. The text which we have selected, the *Nyāyapraveśa,* is a synopsis of Buddhist thinking on logic.

To clarify the approach we have taken in the body of our essay, let us propound the following analogy. A native speaker of a language, as many linguists now assume as an heuristic principle, can enumerate as acceptable an arbitrarily long list of grammatical sentences from his language and as unacceptable another arbitrarily long list of ungrammatical sentences from his language. However, his competence in his language does not, by itself,

guarantee that he can articulate the structure which grammatical sentences of his language have and which ungrammatical ones do not. A linguist who is not a native speaker of this language may try to articulate this structure. Availing himself of his training as a linguist and perusing lists of acceptable and unacceptable sentences of the language as set out by the native speaker, the linguist will articulate, hopefully, what the structure is. If he is successful, he not only will accurately discriminate acceptable from unacceptable sentences enumerated on the lists but also will correctly discriminate as acceptable or unacceptable every subsequent sentence added to the lists by a native speaker. Yet the linguist always runs the risk that a native speaker might add to his list of acceptable sentences a sentence which the linguist's articulation of the language's structure excludes as ungrammatical, or conversely, a native speaker might add to his list of unacceptable sentences a sentence which the linguist's articulation excludes as acceptable.

Now, as we see it, the subject-matter of the *Nyāyapraveśa* is, roughly, argumentation. Argumentation, as circumscribed in this text, has a structure. The author, Śankarasvāmin, sometimes illustrates and sometimes tries to describe this structure. In illustrating it, the author provides us with specimens of instances of proper argumentation (acknowledged as such) and of improper argumentation (also acknowledge as such); just as in listing acceptable sentences as acceptable and unacceptable ones as unacceptable, the native speaker provides the linguist with specimens which exhibit the structure of the language and with specimens which do not. In trying to describe it, the author tries to state what the structure of argumentation is; just as in articulating the structure of a language by which acceptable sentences can be discriminated from unacceptable ones, the linguist tries to provide a grammar of the language.[1] So our task is two-fold: first, to ferret out the structure and then, to ascertain the degree to which Śankarasvāmin has managed to correctly articulate this structure. As a result, this essay falls into three parts: in the first part, we set out the structure; in the second part, we discuss those sections of the *Nyāyapraveśa* which are unclear; and in the

last part, we assess Śankarasvāmin's grasp of the structure of the subject-matter to which he has addressed himself.

In writing this essay, we intend our audience to include Sanskritists and non-Sanskritists alike: we aim this essay both at those who have an interest specifically in the *Nyāyapraveśa* and at those who want to acquire merely a general but representative acquaintance with Indian logic. Thus, for the latter kind of reader, we propound, in the first and third parts of our essay, the scope of the structure with which Śankarasvāmin is trying to come to grips and his understanding of it respectively. We maintain, by the way, though we do not substantiate it here, that this structure is the one which underlies Indian logic, at least as it is expounded in the texts of Buddhism and Nyāyavaiśeṣika. For the former kind of reader, we discuss, in the second part of our essay, those passage of the text either which might seem problematic vis-à-vis our claims in the previous part or which shed light on how Śankarasvāmin understood the structure set out in the previous part. In all these parts, we inevitably resort to some concepts drawn from modern logic. However, logical notation and cant are not used unless they are part of a reformulation of a point already made in plain English; and where they are used, references are made to an appropriate books written to introduce the general reader to the topic.

Documentation for the structure we assert is ensconced in the *Nyāyapraveśa* and documentation for its understanding by Śankarasvāmin is provided at the appropriate places in the essay by notes. In these notes, we furnish references both to an English translation[2] (for those who do not read Sanskrit) and to a Sanskrit edition[3] (for those who do). These references are made through a table which we have organized as follows. First, we have divided the work exhaustively into disjoint passages. Secondly, we have labelled these passages with a decimal notation à la Wittgenstein. This labelling shows clearly how the various passages are related to one another. Furthermore, the table shows which passages are adduced as evidence in the first part of the essay, which are discussed in the second, and which are without import to the task at hand — these last passages are those which

organize the work but which do not add any content to it. The Table forms an Appendix to this article.

I

There are four levels of structure underlying the subject-matter of the *Nyāyapraveśa.* Only for one of them is there a convenient and familiar word; so for the other three we have dredged up two obscure ones and a not-so-obscure but perhaps awkward one. The first level of structure we call "the ontic level." This is the structure embodied in the world of the work.[4] The second level we call by a more familiar term, "the epistemic level." As one might very well guess, it pertains to the structure which is embodied in knowledge of the world by its observers. "The dialectic level" is what we call the third level. This structure defines the limits within which one observer of the world can elicit a belief from another observer of the world.[5] The final level we dub "the forensic level," for the structure here is the rules of a game in which two observers of the world may engage.[6] Since the forensic level presupposes the dialectic level, the dialectic the epistemic, and the epistemic the ontic, we shall begin our exposition with the last and end with the first.

Ontic Level

The world consists of objects and relations. There are two kinds of object, substratum (dharmin) and superstratum (dharma).[7] A superstratum bears at least one relation to a substratum. This relation is not named in the *Nyayāpraveśa*, but it comes to be known in another later tradition of Indian thought, namely Navya-nyāya, as occurrence (vṛtti). This relation obtains if and only if a superstratum is in or on the substratum. In the later tradition just mentioned, this relation of occurrence acquires many forms, the most common of which are contact (saṃyoga) and inherence (samavāya). To see how this relation is applied, suppose that the world includes such objects as pots and tables and that a pot is on a table, then the pot is said to occur on

the table. Here the relation of occurrence is one of contact, for the pot occurs on the table by contact. Again, suppose that the world includes such objects as redness (i.e., the color red) and pots and that a pot is red, then redness occurs in the pot. Here the relation is one of inherence, for redness occurs in the pot by inherence. The converse of the relation of occurrence is the relation of possession. A substratum possesses a superstratum if and only if the superstratum occurs in or on the substratum. Thus, for example, if fire is on a mountain, then the mountain possesses fire; and conversely, if a mountain possesses fire, then fire is on the mountain.[8] Another relation is the relation which a superstratum bears to another superstratum. This relation can be defined in terms of the occurrence-relation. Later, this relation comes to be know as pervasion (vyāpti), but here it is known by its converse, concomitance (anvaya). One superstratum is concomitant with another if and only if in whatever substratum the former occurs the latter occurs. This relation is both reflexive and transitive. That is to say, every superstratum is concomitant with itself; and, if a superstratum is concomitant with another, and the other with a third, then the first is concomitant with the third.

As a result of these relations, the world embodies a structure: If one superstratum, designated by H (hetu-dharma), is concomitant with another superstratum S (sādhya-dharma),[9] and if the former superstratum occurs in a substratum, designated by "p" (pakṣa),[10] then superstratum S occurs in substratum p. This structure[11] can be expressed by the following deduction-schema:

Major Premiss: Whatever has H has S.

Minor Premiss: p has H._____

Conclusion: p has S.

For those familiar with symbolic notation, we can express the same schema in the following way:

Major Premiss: $(\forall x)\,(Hx \rightarrow Sx)$

Minor Premiss: Hp_____

Conclusion: *Sp*

What the deduction-schema provides is a warrant, as it were, that whenever the premisses fit the facts the conclusion is a fact, that is, whenever the premisses are true the conclusion is true.[12] Thus, for example, let us assume that these two claims are factual: whatever has smoke has fire and Mount McKinley has smoke. Then, by virtue of the deduction-schema, it is a fact that Mount McKinley has fire. However, if even one of the premisses is false, the premisses no longer warrant the truth of the conclusion. We should be on our guard not to confuse the notion that the premisses warrant the falsity of the conclusion with the notion that the premisses no longer warrant the truth of the conclusion. When one, or even all, of the premisses of a deduction is false, it is the latter concept which applies, and not the former.

Epistemic Level

Imagine that the world which we have just described has an observer. The observer has a set of beliefs. An observer is said to accept a belief if and only if the belief is a member of the set of beliefs which the observer has. Thus, if an observer has as a set of beliefs that the mountain has fire, that a monkey is in a tree, and that whatever has smoke has fire; then the observer accepts that the mountain has fire, that a monkey is in a tree, and that whatever has smoke has fire.

Beliefs about this world are of two kinds: beliefs about which superstrata are concomitant with which superstrata, and beliefs about which superstrata are in which substrata. Beliefs of the first kind can be expressed in the form "Whatever has superstratum A has superstratum B", or more easily as "Whatever has *A* and *B*", or symbolically as "($\forall$ *x*) (*Ax* $\rightarrow$ *Bx*)". The third belief in the set of beliefs given above as examples has this form. Beliefs of the second kind can be expressed in the form "Substratum *a* has superstratum *C*", or more succinctly as "*a* has *C*", or symbolically as "*Ca*". The first and second beliefs in the example-set above illustrate this form.

Also, if an observer accepts a belief, then he necessarily accepts that the superstrata of the belief exist, if it is a belief of the first kind, or, he necessarily accepts that both the superstratum and the substratum of the belief exist, if it is a belief of the second kind. So, if an observer accepts that whatever has smoke has fire, then he accepts that smoke exists and that fire exists. Similarly, if an observer accepts that a tree has a monkey, then he accepts that the tree exists and that the monkey exists.

An observer may augment the number of beliefs in the set of his beliefs in two ways, by perception (pratyakṣa) and by inference (anumāna).[13] In the first way, if an observer perceives that a substratum, say *a*, has a superstratum, say *C*, then he adds a belief to that effect to his set of beliefs. That is, if an observer perceives that *Ca*, then he accepts that *Ca*. So, an observer accepts that the mountain has smoke when he perceives that the mountain has smoke. In the second way, an observer adds to his set of beliefs a belief wherein what is believed fits the form of the conclusion of the deduction-schema, if an observer picks from his set of beliefs two beliefs wherein what is believed fits the form of the two premisses of the deduction-schema. In other words, if an observer accepts two beliefs which can be expressed in the form of the premisses of the deduction-schema, then he accepts the belief which is expressed in the form of the conclusion of the schema. It follows, then, that the acceptability of the conclusion of an inference depends not only on the logical deducibility of the conclusion from the premisses but also on the acceptability of the premisses.

Dialectic Level

An observer may augment the number of beliefs which another observer has in only one way, namely, by argument (sādhana).[14] An observer augments the number of beliefs another observer has if and only if the former compels the latter to add to his set of beliefs a belief which was previously not a member of his set of beliefs;[15] that is to say, the former causes the latter to

accept a belief which the latter did not previously accept; or, to put it still another way, the former convinces (pratyāyati) the latter of a belief.[16]

For one observer to convince another of a belief, the former must meet four requirements. First, he must find a belief wherein what is believed can be expressed in the form "Superstratum H is in substratum p". Secondly, he must find two beliefs wherein what is believed can be expressed in the form "Wherever superstratum H is superstratum S is" and "Wherever superstratum S is not superstratum H is not". Thirdly, for each of these last two beliefs, he must name a substratum (other than the one designated in the argument being made) which satisfies the universal statement expressing each belief.[17] We may summarize these first three requirements by the following argument-schema:[18]

Major Premiss 1: Whatever has not S has not H.

Example 1:   For example, q.

Major Premiss 2: Whatever has H has S.

Example 2:   For example, r.

Minor Premiss: p has H._____

Conclusion: p has S.

(where "q" names any substratum other than the one named by "p" which has neither superstratum H nor superstratum S; and where "r" names any substratum other than the one named by "p" which has both superstratum H and superstratum S.)

This can be re-expressed symbolically as:

Major Premiss 1: $(\forall x)(\sim Sx \rightarrow \sim Hx)$.

Example 1:   For example, q.

Major Premiss 2: $(\forall x)(Hx \rightarrow Sx)$.

Example 2:   For example, r.

Minor Premiss : Hp._____

Conclusion: Sp.

(where $q \neq p \wedge \sim Hq \wedge \sim Sq$; and where $r \neq p \wedge Hr \wedge Sr$.)

Lastly, it is required that the beliefs and examples which are stated in the argument be established (prasiddha) (siddha) ones. To be established (for an argument) (between two observers) means to be accepted by both observers (at the time of the argument).[19]

Let us note the two major premisses are logically equivalent. That is to say, whenever one is true, the other is true, and whenever one is false, the other is false. Let us also note that if an observer argues correctly for a belief, he *a fortiori* accepts that belief, for in carrying out an argument he carries out an inference (though in carrying out an inference he does not necessarily carry out an argument). Therefore, the convinceability, as it were, of an argument depends on the acceptability of its ensconced inference, which, in turn, depends on the validity of its ensconced deduction. That is, if the deduction is not valid, then the inference is not acceptable; and if the inference is not acceptable, then the argument is not convincing.

Forensic Level[20]

To be eligible to play the game, one must be an observer of the world as described above. Moreover, it is agreed that, during the game, any belief acquired by one player as a result of genuine perception is acquired by the other players also as a result of genuine perception. Thus, if one player genuinely perceives smoke on a mountain, then the other player also will genuinely perceive smoke on that mountain.[21]

Now the game is played in rounds and each round of the game consists in two turns. The player to take the first turn of a round is the proponent in that round; and the player to take the second turn of a round is the opponent in that round. In the first turn, the proponent has an opportunity to compel acceptance of a belief from his opponent. In the second turn, the opponent has an opportunity to demur to the belief argued for by the proponent. Since the only means whereby one observer may augment the number of beliefs which another observer accepts is argument, the first turn of a round comprises the proponent making an argument (Cf. fn. 16), and the second

turn of that round comprises the opponent finding fault with that argument.[22] For any given round, the opponent is compelled to accept the belief argued for by the proponent if and only if the opponent does not find an actual fault with the argument of the proponent.

The player to be the proponent in the next round is the opponent of the current round if and only if the opponent of the current round successfully finds fault with the argument advanced by the proponent of the current round. (Obviously this leaves open the question as to which player is the proponent and which the opponent in the first round.) The game ends when there is a winner. A player becomes a winner when and only when, at the end of some round, he has compelled the other player to accept explicitly inconsistent beliefs while he himself has eschewed accepting explicitly inconsistent beliefs.[23] (It is possible that the beliefs shared by the two players are not sufficient to permit either player to force the other's set of beliefs to be explicitly inconsistent.)

II

We have now seen the structure underlying the subject-matter of the *Nyāyapraveśa.* However, in adducing evidence to support our analysis, we have ignored many passages, most of which are those in which Śankarasvāmin attempts to describe this same structure. To discuss these passages in detail will serve both to clinch our claims concerning what the structure of argumentation here is and to elucidate how Śankarasvāmin conceives it.

Before beginning this discussion, let us first adopt an emendation. This emendation does not affect what we are about to say, but it does throw into greater relief some of the points we make below. We suggest that Sections ∅.2226 and ∅.2231 be emended as follows: all of each passage, except for the terms by which they are named, "Viruddha-avyabhicārin" (i.e., "That which is invariably concomitant with the excluded ones") and "Dharma-svarūpa-viparīta-sādhana" ("That which establishes the opposite of the superstratum

itself"), should be exchanged. We support this emendation on two grounds. First, it renders the supersection ∅.222 a coherent whole insofar as the supersection (under the emendation) corresponds exactly to Dignāga's *Hetucakra-nirṇaya*.[24] Secondly, it yields a better fit between the meaning of the terms and what the terms name; this is especially true of section ∅.2226.

A.

The first section deserving our attention is ∅.223.[25] Here Śaṅkarasvāmin discusses and illustrates four cases of objectionable arguments (sādhana). However, the basis for their being considered objectionable is not obvious. Below we try to make the basis clear.

The first case involves a pair of arguments. As usual, Śaṅkarasvāmin has stated these arguments only in abbreviated form. Let us see them in their unabridged form.[26]

	Major Premiss 1 *S:*	Yat nityam tat a-kṛtakam
	Example 1 *S:*	ākāśa-vat
	Major Premiss 2 *S:*	Yat kṛtakam tat a-nityam
	Example 2 *S:*	ghaṭa-vat
	Minor Premiss *S:*	kṛtakaḥ śabdaḥ_____
	Conclusion *S:*	a-nityaḥ śabdaḥ
Argument 1:	Major Premiss 1 *E:*	Whatever is eternal is non-produced
	Example 1 *E:*	like sky
	Major Premiss 2 *E:*	Whatever is produced is non-eternal
	Example 2 *E:*	like pot
	Minor Premiss *E:*	Sound is produced_____
	Conclusion *E:*	Sound-is non-eternal.
Argument 2:	Major Premiss 1 *S:*	Yat a-nityam tat a-śrāvaṇam
	Example 1 *S:*	
	Major Premiss 2 *S:*	Yat śrāvaṇam tat nityam

Example 2 *S:*   śabda-tva-vat

Minor Premiss *S:*   śrāvaṇaḥ śabdaḥ_____

Conclusion *S:*   nityaḥ śabdaḥ

Major Premiss 1 *E*: Whatever is non-eternal is inaudible

Example 1 *E*:

Major Premiss 2 *E:* Whatever is audible is eternal

Example 2 *E*:   For example, sound-ness

Minor Premiss *E:*   Sound is audible_____

Conclusion *E:*   Sound is eternal

The fact that we are given a pair of arguments sugests that what is wrong with these arguments does not lie in either taken by itself but in both taken together. This suggestion is confirmed when we also recall that Argument 1 is cited by Śankarasvāmin as a paradigm of an inference satisfying the criteria of trirūpa (a notion to be discussed below, pp. 364 ff). What is objectionable is precisely what is not stated. Argument 1 is an argument usually attributed to adherents of Buddhist doctrine; Argument 2 is an argument which is usually attributed to adherents of Vaiśeṣika doctrine.[27] Since Buddhists do not accept that sound-ness (śabda-tva) exists, the second example in Argument 2 fails to convince them; and conversely, since adherents of Vaiśeṣika doctrine do accept that sound is eternal (śabdaḥ nityaḥ), the major premisses of Argument 1 fail to convince them. Thus Śankarasvāmin says:[28]

> Ubhayoḥ samśaya-hetu-tvāt dvau api etau anaikāntikaḥ samuditau eva

> These two arguments are inconclusive only when taken together, since the pair is grounds for doubt [i.e., being unconvinced].

The second case in this section is more straightforward. The argument, as Tachikawa points out,[29] is one put forth by the adherents of Sāṃkhya doctrine, in which the soul (ātman) is held to be simple. If we assume that

this is what the argument is intended to establish, then it fails to do so. The conclusion that the eyes etc. are for the use of another thing is not incompatible with either the belief that the other object is simple or the belief that the other thing is complex. And so, Śankarasvāmin observes:[30]

> Ayam hetuh yathā pārārthyam cakṣuśa-ādīnām sādhayati tathā samhatatvam api parasya ātmanaḥ sādhayati ubhayatra avyābhicārāt.

> To the extent that the grounds establish the eyes, and so forth, to be for the sake of what is other [than the eyes, and so forth], to that extent [they] establish what is other [than the eyes, and so forth], the soul, to be complex; for [the grounds] do not deviate from [i.e., permit] both [conclusions, i.e., that the soul is simple and that the soul is complex].

The last two cases of this section rely on just one example, but that example is the conflation of three arguments. For the sake of clarity, let us spell them out.

Argument 1:	Major Premiss 1 S:	Yat dravyam tat an-eka-dravye
	Example 1 S:	
	Major Premiss 2 S:	Yat-eka-dravye tat na dravyam
	Example 2 S:	Sāmānya-viśeṣa-vat
	Minor Premiss S:	Bhāvaḥ eka-dravye_____
	Conclusion S:	Bhāvaḥ na dravyam.
	Major Premiss 1 E:	Whatever is a substance does not exist in just one substance
	Example 1 E:	
	Major Premiss 2 E:	Whatever exists in just one substance is not a substance

	Example 2 *E:*	For example, lower universals
	Minor Premiss *E:*	Existence exists in just one substance_____
	Conclusion *E:*	Existence is not a substance.
	Major Premiss 1 *S:*	Yaḥ guṇaḥ saḥ na guṇeṣu
	Example 1 *S:*	
	Major Premiss 2 *S:*	Yaḥ guṇeṣu saḥ na guṇaḥ
	Example 2 *S:*	Sāmānya-viśeṣa-vat
	Minor Premiss *S:*	Bhāvaḥ guṇeṣu_____
Argument 2:	Conclusion *S:*	Bhāvaḥ na guṇaḥ.
	Major Premiss 1 *E:*	Whatever is a quality does not exist in qualities
	Example 1 *E:*	
	Major Premiss 2 *E:*	Whatever exists in qualities is not a quality
	Example 2 *E:*	For example, lower universals
	Minor Premiss *E:*	Existence exists in qualities_____
	Conclusion *E:*	Existence is not a quality.
Argument 3:	Major Premiss 1 *S:*	Yat karma tat na karmasu
	Example 1 *S:*	
	Major Premiss 2 *S:*	Yat karmasu tat na karmasu tat na karma
	Example 2 *S:*	Sāmānya-viśeṣa-vat
	Minor Premiss *S:*	Bhāvaḥ karmasu_____

Conclusion *S:*	Bhāvaḥ na karma
Major Premiss 1 *E:*	Whatever is an action does not exist in actions
Example 1 *E:*	
Major Premiss 2 *E:*	Whatever exists in actions is not an action
Example 2 *E:*	For example, lower universals
Minor Premiss *E:*	Existence exists in actions_____
Conclusion *E:*	Existence is not an action.

The problem with these three arguments is that they do not force one to conclude what the proponent of these arguments hopes one to conclude — namely, that existence (bhāva) belongs to a category other than substance (dravya), quality (guṇa), or action (karma) — even if one accepts all three arguments. The reason is this: if one were to add the premise that there are just three categories — namely, substance (dravya), quality (guna), and action (karma) — to the conclusions already reached, then one concludes that existence does not exist. Consequently, Śankarasvāmin observes this about the amalgamation of arguments:

> Ayam hetuḥ yathā dravya-ādi-pratiṣedham bhāvasya sādhayati tathā bhāvasya abhāvatvam api sādhayati ubhayatra avyābhicārāt.

> To the extent that the grounds establish existence to be excluded from substance [, quality, and action], to that extent [they] establish existence not even to exist; for [the grounds] do not deviate from [i.e., permit] both [conclusions, i.e., that existence is excluded from substance, quality, and action and that existence does not exist].

The last case is parasitic upon the case just examined. The adherents of Vaiśeṣika doctrine believe that a substratum (dharmin) is the cause of an observer's idea of a subtratum. In virtue of this belief, they hold that each substratum has the superstratum (dharma) of being the cause of the idea of

that substratum.[31] In light of the foregoing argument, one can arrive at two other purportedly incompatible conclusions. If one concluded above that existence belongs to some category other than substance, quality, or action, then one can conclude that existence is the cause of our idea of existence; if one concluded that existence does not exist, since the only categories there are are substance, quality, and action, then one can conclude, somewhat awkwardly, that existence is the cause of our idea of non-existence.[32] And so Śaṅkarasvāmin adds:

> Ayam eva hetuḥ asmin eva pūrva-pakṣe asya eva dharminaḥ yaḥ viśeṣaḥ satpratyāya-kartṛtvam nāma tat-viparītam asat-pratyāya-kartṛtvam api sādhayati ubhayatra avyābhicārāt.

> Precisely these grounds establish with respect to this very opponent [envisaged in the case above] just this substratum [i.e., existence] is the cause even of the idea of non-existence, which is opposite to the superstratum of being the cause of the idea of non-existence; for [these grounds] do not deviate from [i.e., permit] both [conclusions, i.e. that existence is the cause of the idea of existence and that existence is the cause of the idea of nonexistence].

B.

The next problem to be confronted is the problem of how Śaṅkarasvāmin understands the structure of argument (sādhana). To answer this question, let us review only the descriptive portions of supersection ∅.1, where Śaṅkarasvāmin illustrates and describes the structure of sādhana. Then, let us examine for ambiguity the principal terms he employs therein. Finally, let us look at supersection ∅.222, paying special attention to section ∅.2222 (Cf. Part I).

B1.

Śankarasvāmin describes sādhana (argument) as follows:

∅.1 Sādhana is statements of pakṣa [i.e., conclusion], hetu [i.e., minor premiss], and dṛṣṭānta [i.e., the major premisses and their examples]. By the statements of pakṣa, hetu, and dṛṣṭānta, a state-of-affairs unknown to the questioners is conveyed [to them].

∅.11 Pakṣa is an established substratum [i.e., substratum p] desired by the proponent to be established to qualified by [i.e., to have] an established qualifier [i.e., superstratum S]. It is implicit that it [i.e., pakṣa] is not excluded by perception, inference, tradition, common sense, or its own statement.

∅.12 Hetu [i.e., superstratum H] has three forms: [It] is a superstratum in pakṣa [i.e., substratum p], [it] is in sapakṣa, and [it] is not in vipakṣa.

∅.121 Sapakṣa is any substratum similar [to pakṣa, i.e., substratum p,] insofar as [both it and pakṣa] have the same superstratum to be established [i.e., superstratum S].

∅.122 Vipakṣa is where that which is to be established [i.e., superstratum S] is not.

∅.13 Dṛṣṭānta is two-fold insofar as either [both it and pakṣa] have the same superstratum [i.e., superstratum S] or [both it and pakṣa] do not have the same superstratum [i.e., superstratum S].

∅.131 Dṛṣṭānta insofar as [both it and pakṣa] have the same superstratum is such that hetu [i.e., superstratum H] is said to be in sapakṣa.

∅.132 Dṛṣṭānta insofar as [both it and pakṣa] do not have the same superstratum is such that when there is an absence of that which is to be established [i.e., superstratum S] there is an absence of hetu [i.e., superstratum H].

B2.

From this translation we can isolate the following ambiguities in the terms he uses. The term "pakṣa" denotes: (1) the statement which is a conclusion of

an argument, (2) the state-of-affairs expressed by the conclusion of an argument, and (3) the substratum mentioned in the conclusion of an argument. The term "hetu" denotes: (1) the statement which is the minor premiss of an argument,[33] (2) the superstratum mentioned in the minor premiss of an argument, and (3) an abbreviation for the full formal grounds underlying the conclusion of an argument (sādhana). The term "dṛṣṭānta" abbreviates both "sādharmya-dṛṣṭānta" (i.e., dṛṣṭānta insofar as [both it and pakṣa] have the same superstratum) and "vaidharmya-dṛṣṭānta" (i.e., dṛṣṭānta insofar as [both it and pakṣa] do not have the same superstratum). Each of these terms is in turn ambiguous. Each denotes (1) the statement which expresses the major premiss together with its example, (2) the statement of the major premiss alone, (3) the example given for the major premiss, and (4) the state-of-affairs expressed by the major premiss. Furthermore, "sādharmya-dṛṣṭanta" denotes any substratum such that it is sapakṣa and superstratum H is in it; and "vaidharmya-dṛṣṭānta" denotes any substratum such that it is vipakṣa and superstratum H is not in it. The term "artha" denotes: (1) a state-of-affairs (cf. the second sense of "pakṣa") and (2) a substratum (cf. the third sense of "pakṣa"). Finally, let us note that superstratum S is named sometimes by the expression "sādhya-dharma" (i.e., "that which is to be established"). This expression, sometimes abbreviated as "sādhya", denotes: (1) the statement which is the conclusion of an argument, (2) the state-of-affairs expressed by the conclusion of an argument, and (3) the superstratum mentioned in the conclusion of an argument. (cf. pakṣa.)

B3.

Having delved into the various senses of the principal terms of the passage with which we are now concerned, let us see what corresponds to Śankarasvāmin's description of sādhana to what in our analysis. One correspondence which one might see is one between the deduction-schema and trirūpa (i.e., the three forms mentioned in ∅.12). That is, one might contend this: on the one hand, the criteria provided by trirūpa (cf. ∅.12) give,

for any particular state-of-affairs of a certain kind, the kinds of conditions which must be met for other states-of-affairs to be sufficient to guarantee the existence of the former in virtue of the existence of the latter; while, on the other hand, the criteria implicit in the deduction-schema[34] give, for any particular statement of a certain form, the forms which must be met for other statements to be sufficient to guarantee the truth of the former to follow from the truth of the latter. More specifically, one might contend that the first, second, and third forms of trirūpa stipulate for the world what the minor premiss, major premiss 2, and major premiss 1 stipulate for the statement of deduction. For this correspondence to hold, the second and third forms of trirūpa must be logically equivalent.[35] But the two forms are not logically equivalent, and hence the correspondence does not hold: in particular, what the second form of trirūpa exacts from the world does not correspond to what major premiss 2 exacts from a statement in a deduction.

To show this lack of logical equivalence, we shall first ascertain under just what conditions the major premisses are true or false and then scrutinize what each form of trirūpa asserts. In turning to the first task, let us begin by rehearsing a few concepts from modern logic. First, the major premisses, which we have already stated to be logically equivalent, are themselves logically equivalent to an expression of the form "Nothing which has H does not have S", or symbolically, "$\sim(\exists x)(Hx \wedge \sim Sx)$". Secondly, all possible distributions which two superstrata can have with respect to all substrata can be depicted. To do this, we merely assume that every substratum either has or has not a superstratum (i.e., an ontic version of the Law of Excluded Middle) and that no substratum both has and has not a superstratum (i.e., an ontic version of the Law of Non-contradiction). From these assumptions it follows that there are only nine possible distributions. These distributions are shown in Figure 1, in diagrams which are to be interpreted as follows:
Fig 1
(1)   (2)   (3)

(4)   (5)   (6)

(7)   (8)   (9)

The area of each box corresponds to all the substrata in the world. The area of each half-box marked "*S*" corresponds to all the substrata which have the superstratum *S*. The area of each half-box marked "*$*" correspond to all the substrata which do not have the superstratum *S*. The shaded area in each box corresponds to all the substrata which have the superstratum *H*. And the unshaded area corresponds to all the substrata which lack the superstratum *H*.

Now we ask the question, what distributions depicted in the diagrams does the expression "Nothing which has *H* does not have *S*" (i.e., "~($\exists x$) (*Hx* $\wedge$ ~*Sx*)") fit? Clearly the distributions in diagrams (1), (3), (4), (6), (7), and (9) depict cases wherein there is something which has *H* but does not have *S* (i.e., ($\exists x$) (*Hx* $\wedge$ ~*Sx*)). But this is the contradictory of the expression we are interested in. The expression we are interested in, then, fits the distributions depicted by the complementary set of diagrams, (2), (5), and (8), wherein there is nothing which has *H* and does not have *S* (i.e., ~($\exists x$) (*Hx* $\wedge$ ~*Sx*)).

Having clarified the conditions under which the major premisses are deemed true or false, we must turn to our second task, the scrutiny of what

is asserted in trirūpa. This task requires that we address ourselves to a fundamental problem: the problem of concision of expression in Sanskrit works. Our author is in a trend exhibited in Sanskrit works as increasing over time from the Vedic period wherein, to achieve concision of expression, Sanskrit authors availed themselves of three devices — nominalization,[36] compounding, and ellipsis. The result of the use of these devices is that what would have been explicit is rendered implicit.[37] So, to properly understand trirūpa, we must restore what is implicit to what is explicit by reversing the effect of these devices, that is, by denominalization, parsing compounds, and supplying what has been ellipsed.

To insure that our restoration is as clear as possible, we ask the reader to bear the following in mind. First, each of the three clauses in trirūpa are marked, respectively, by the numerals "1", "2", and "3" each followed by a decimal point. The initial version of each clause is marked by the numeral "1" following the decimal point. Every alteration of a clause is shown in its label by a change in the numeral which follows the decimal point. Secondly, each Sanskrit sentence is paired with a literal English translation. We have tried our best to mirror the pertinent syntactical features of each Sanskrit sentence in its English translation. To this end, we have deviated from two standard practices: Sanskrit compounds, usually transliterated as one orthographic unit, have been broken into their lexical components by the insertion of hyphens between those components; also, Sanskrit compounds, usually translated as English phrases, have been rendered, somewhat factitiously, as English compounds. Finally, restored sentences are not to be thought of as surface sentences (i.e., sentences likely to be found in the Sanskrit corpus) but rather as representations of deeper sentences (i.e., structues underlying sentences actually found in a portion of the Sanskrit corpus). Consequently, they ought not to be expected to obey the constraints of surface grammar (e.g., constraints on Sanskrit word order).

To demonstrate what we mean, we shall begin our restoration with the first form, since it is easily treated in the manner we have in mind.[38] By supplying what has been ellipsed, we obtain:

1.1 *S* [Hetu-dharmasya] pakṣa-dharma-tvam.

1.1 *E* [Superstratum *H* has] pakṣa-superstratum-ness.

Denominalization[39] of this sentence yields:
1.2 *S* [Hetu-dharmaḥ] pakṣa-dharmaḥ asti.
1.2 *E* [Superstratum *H*] is a pakṣa-superstratum.

We parse the compound to obtain:
1.3 *S* [Hetu-dharmaḥ] pakṣe dharmaḥ asti.
1.3 *E* [Superstratum *H]* is a superstratum in pakṣa.

And we simplify as follows:
1.4 *S* [Hetu-dharmaḥ] pakṣe asti.[40]
1.4 *E* [Superstratum *H*] is in pakṣa.

Since the second form is the most difficult, we shall treat the last form next. Again, the first step is to supply what has been ellipsed.
3.1 *S* [Hetu-dharmasya] vipakṣe a-sattvam.
3.1 *E* [Superstratum *H* has] non-existence in vipakṣa.

By denominalizing, we obtain:
3.2 *S* [Hetu-dharmaḥ] vipakṣe na asti[41]
3.2 *E* [Superstratum *H*] is not in vipakṣa.

Because the next step is to replace "vipakṣa," as it occurs in the third form, by its definition, we must now treat the definition of "vipakṣa" in the same manner as we have treated the other sentences. The definition is this:
V1 *S* Vipakṣaḥ yatra sādhyam na asti.
V1 *E* Vipakṣa is where that which is to be established is not.

By supplying what has been ellipsed and by substituting the expression "saḥ arthaḥ yasmin" ("that substratum in which") for the word "yatra" ("where"), we obtain this definition:
V2 *S* Vipakṣaḥ sah arthah yasmin sādhya [-dharmah] na asti.
V2 *E* Vipakṣa is that substratum in which [superstratum] *S* is not.

Now we replace the definiendum (i.e., the part which is defined in a definition), "vipakṣa," as it occurs in the third form of trirūpa, with the definiens (i.e., the defining part of the definition) "sah arthah yasmin sādhya [-dharmah] na asti" ("that substratum in which [superstratum] S is not"), and thereby obtain:

3.3 [Hetu-dharmaḥ] tasmin arthe yasmin sādhya [-dharmaḥ] na asti na
S asti.

3.3 [Superstratum H] is not in that substratum in which [super-stratum] S
E is not.

This result, however, is amphibolous in two ways. First, what the negative particle (the second in the Sanskrit and the first in the English) negates may be either the entire remainder of the sentence, in which case the negative particle is said to have wide scope, or merely the main clause, in which case the negative particle is said to have narrow scope. These two construals are shown below by a pair of sentences which are slight modifications of 3.3 and in which we use corner quotation marks to lay off the scope of each negative particle.

3.31 ⌜[Hetu-dharmah] tasmin arthe asti ⌜yasmin sādhya [-dharmaḥ] na
S asti⌝⌝ [iti] na.

3.31 It is not the case that ⌜[superstratum H] is in that substratum ⌜in which
E [superstratum] S is not⌝⌝.

and

3.32 ⌜[Hetu-dharmah] tasmin arthe na asti⌝ ⌜yasmin sādhya [-dharmaḥ] na
S asti⌝.

3.32 ⌜In that substratum in which [superstratum] S is not⌝⌜ [superstratum
E H] is not⌝.

Secondly, the expression "tasmin arthe yasmin" ("in that substratum in which") may mean only some substratum or every substratum. This compounding of the amphibolies leaves our sentence liable to four

construals. To construe the expression "tasmin arthe yasmin" ("in that substratum in which") either in 3.31 to mean every substratum or in 3.32 to mean some substratum leads, respectively, to the unlikely criteria that in some substratum in which superstratum *H* does not occur superstratum *S* does and that in some substratum neither superstratum *H* nor superstratum *S* occur. In contrast, to construe the expression either in 3.31 to mean some substratum or in 3.32 to mean every substratum leads, in both cases, to the very likely criteria that there is no substratum in which superstratum *H* occurs and superstratum *S* does not and that in every substratum in which superstratum *S* does not occur superstratum *H* does not. Indeed, these latter criteria are logically equivalent.

The question now arises: How are we to choose between these grammatically distinct but logically equivalent construals? This question will be dealt with below. For the moment, we shall assume that 3.31 is the sentence which properly displays the scope of the negative particles and that just some substratum is what is meant by the expression "tasmin arthe yasmin" ("in that substratum in which"). This construal can be displayed in Sanskrit as follows:

3.4 ⌜Tasmin arthe [hetu-dharmaḥ] asti ⌜yasmin sādhya [-dharmaḥ] na
S   asti⌝⌝ [iti] na.

3.4 It is not the case that ⌜[superstratum *H*] is in a substratum ⌜in which
E   [superstratum] *S* is not⌝⌝.

Treating the second form of trirūpa in the same manner as above, we supply first what has been ellipsed.

2.1 *S* [Hetu-dharmasya] sapakṣe sattvam.

2.1 *E* [Superstratum *H* has] existence in sapakṣa.

Then we denominalize the result.

2.2 *S* [Hetu-dharmaḥ] sapakṣe asti.[42]

2.2 *E* [Superstratum *H*] is in sapakṣa.

Now turning to the definition of "sapakṣa," we supply what has been ellipsed there as well.

S1
S   [Tasya pakṣasya ca] sādhya-dharma-sāmānyena [pakṣena] samānaḥ arthaḥ sapakṣaḥ.

S1
E   Through superstratum-*H*-ness [of it and pakṣa], any substratum similar [to pakṣa] is sapakṣa.

This definition is denominalized to yield:

S2
S   [Tasya] sādhya-dharmaḥ [pakṣasya] sādhya-dharmena samānaḥ iti anena [pakṣena] samānaḥ arthaḥ sapakṣaḥ.

S2
E   Insofar as [its] superstratum *S* is the same as [pakṣa's] superstratum *S*, any substratum similar [to pakṣa] is sapakṣa

After reflecting on how the expression "iti anena" ("insofar as") relates the subordinate clause to the main clause, we see that the subordinate clause specifies the respect in which a substratum be similar (samāna) to pakṣa, namely, in the respect that a substratum and pakṣa have the identical (samāna) superstratum.[43] Also, it is reasonable to assume that the word "samāna" ("similar") restricts any two things to be regarded as samāna (i.e., similar, as opposed to identical) to non-identical things. In view of these two considerations, we rewrite S2 as follows:

S3
S   Saḥ arthaḥ yasmin sādhya-dharmaḥ asti yaḥ pakṣāt bhinnaḥ sapakṣaḥ.

S3
E   That substratum in which superstratum *S* is and which is different from pakṣa is sapakṣa.

Substituting for the definiendum "sapakṣa" mentioned in the second form of trirūpa the definiens "sah arthah yasmin sādhya-dharmaḥ asti yah pakṣāt bhinnaḥ" ("that substratum in which superstratum *S* is and which is different from pakṣa"), we obtain:

2.3
S   [Hetu-dharmaḥ] tasmin arthe yasmin sādhya-dharmaḥ asti yaḥ paksāt bhinnaḥ asti.

2.3
[Superstratum *H]* is in that substratum in which superstratum *S* is and

E which is different from pakṣa.

Again we are confronted with the expression "tasmin arthe yasmin" ("in that substratum in which"), and so again we are confronted with the expression's amphiboly. Although in our discussion of 3.3 we choose to understand the expression as meaning just some substratum, nevertheless here we choose to understand it as meaning every substratum. For surely the criterion is not that there be just some substratum different from pakṣa in which superstratum *H* and superstratum *S* occur; and so the criterion must be that superstratum *S* occurs in whatever substratum different from pakṣa superstratum *H* occurs. This construal of 2.3 is put more conspicuously in Sanskrit as follows:

2.4 Yasmin arthe [hetu-dharmaḥ] asti yaḥ pakṣāt bhinnaḥ tasmin sādhya[-
S   dharmaḥ] asti.

2.4 In whatever substratum different from pakṣa [superstratum *H*] is,
E   [superstratum] *S* is.

Now that we have ferreted out the unexpurgated version of the second and third forms of trirūpa, we can see that they are not logically equivalent. After all, for any valid deduction in which the premisses are true, it is true that if substratum *p* does not have superstratum *S* then it does not have superstratum *H*; but it is false that if substratum *p* has superstratum *H* then it both has superstratum *S* and is not identical with itself. Put in terms of symbols, it is false that[44]

$$(\forall x)\,(\backsim Sx \rightarrow \backsim Hx) \equiv (\forall x)\,(Hy \rightarrow (Sy \wedge y \neq p))$$

Only two assumptions underlying this conclusion might be challenged: that the same expression "tasmin arthe yasmin" ("in that substratum in which") is construed differently in 2.3 and 3.3, though 2.3 and 3.3 seem to have the same grammar; and that the definition of sapakṣa is such that what is similar to pakṣa cannot be pakṣa itself. A defense of these two construals not only with render the conclusion we have reached irrefragable but also

will clarify a number of enigmas about trirūpa in general and this text in particular.

To see why the expression "tasmin arthe yasmin" ("in that substratum in which") is construed differently in 2.3 and 3.3, let us compare the two forms, first as described in ∅.12(a) and later as illustrated in ∅.12(b). We recall that by supplying what has been ellipsed and by denominalizing that result, we obtain from "sapakṣe sattvam" ("existence in sapakṣa") and "vipakṣe asattvam" ("non-existence in vipakṣa")

2.2 *S* [Hetu-dharmah] sapakṣe asti.

2.2 *E* [Superstratum *H*] is in sapakṣa.

and

3.2 *S* [Hetu-dharmaḥ] vipakṣe na asti.

3.2 *E* [Superstratum *H]* is not in vipakṣa.

respectively. In illustrating the application of these two forms to an inference, Śankarasvāmin alludes to the following inference, which he regards to be valid and to have true premisses.

Major Premiss 1 *S*: Yat nityam tat a-kṛtakam.

Example 1 *S*:　　Yathā ākāśa-ādi iti.

Major Premiss 2 *S*: Yat kṛtakam tat a-nityam.

Example 2 *S*:　　Yathā ghaṭa-ādi iti.

Minor Premiss *S*:　Śabdaḥ kṛtakaḥ._____

Conclusion *S:*　　Śabdaḥ a-nityaḥ.

Major Premiss 1 *E*: Whatever is eternal is non-produced.

Example 1 *E*:　　For example, sky, etc.

Major Premiss 2 *E*: Whatever is produced is non-eternal.

Example 2 *E:*　　For example, pot, etc.

Minor Premiss *E*:　Sound is produced._____

Conclusion *E:*　　Sound is non-eternal.

With respect to this inference, Śankarasvāmin claims that superstratum H, kṛtaka-tvam (produced-ness) satisfies the criteria of trirūpa; in particular, he claims

2.21 S Kṛtaka-tvam … sapakṣe eva asti.

2.21 E Produced-ness … is only in sapakṣa.

and

3.21 S Kṛtaka-tvam … vipakṣe na asti eva.

3.21 E Produced-ness only … is not in vipakṣa.

We see that besides the overt mention of a particular superstratum, the only difference between 2.2 and 3.2 on the one hand and 2.21 and 3.21 on the other is the mention of the word "eva" ("only") in the latter and its absence in the former.

One use of the particle "eva" ("only"), the one pertinent here, is to indicate a relation between two classes. In particular, it indicates either that one class includes another (i.e., that every member of the latter class is a member of the former) or that one class overlaps another (i.e., that the two classes have a member in common).[45] To see exactly how this works, consider the following sentence-schema for a simple copulative Sanskrit sentence:

$$G_1 - G_2 - \text{copula} -$$

(where "G_1" and "G_2" denote general terms.[46])

Now, as the reader can see, the particle can be placed in three different positions in the sentence-schema and each placement causes a sentence fitting the schema to express a different relation between the class of objects of which G_1 is true and the class of objects of which G_2 is true. In the first position, the particle "eva" ("only") causes the sentence to tell its reader that the class of objects of which G_1 is true includes the class of objects of which G_2 is true. In the second position, it causes the sentence to tell its reader instead that the class of objects of which G_2 is true includes the class of objects of which G_1 is true. And in the third position, it causes the sentence

to tell its reader that the two classes have an object in common. These three configurations of simple copulative Sanskrit sentences and the relations between two classes which they express are summarized below.[47]

$$
\begin{array}{ll}
G_1 \text{ eva } G_2 \text{ copula} & g_2 \subseteq g_1 \\
G_1 \; G_2 \text{ eva copula} & g_1 \subseteq g_2 \\
G_1 \; G_2 \text{ copula eva} & g_1 \cap g_2
\end{array}
$$

(where "G_1" and "G_2" denote general terms and "g_1" and "g_2" denote classes of objects of which G_1 and G_2 are true respectively. "$\subseteq$" means "is included in" and "$\cap$" means "overlaps".)

The use of the particle "eva" on 2.21 and 3.21 can be made clearer by denominalizing each as follows:

2.21* *S* Kṛtakah ... sapakṣaḥ eva.

2.21* *E* Only sapakṣa are ... produced things.

3.21* *S* Kṛtakaḥ ... vipakṣaḥ na asti eva.

3.21* *E* No vipakṣa is ... a produced thing.

In the first case, Śankarasvāmin claims that the class of substrata which are produced (kṛtaka) include the class of substrata which are sapakṣa; that is to say, he claims that whatever is produced (kṛtaka) is sapakṣa. In the second case, Śankarasvāmin claims that the class of substrata which are vipakṣa does not overlap with the class of substrata which are produced (kṛtaka). The explicit indication by the particle "eva" ("only") in the illustration of how the pertinent classes relate corresponds to our construal of the expression "tasmin arthe yasmin" ("in that substratum in which") in 2.3 and 3.3. Śankarasvāmin's illustration, therefore, confirms the construals of 2.3 and 2.4 and of 3.3 as 3.4.

This brings us to the problem of how to interpret the word "samāna" ("similar"). For this, we draw the reader's attention to Śankarasvāmin's formulation of sādharmya-dṛṣṭānta (i.e., dṛṣṭānta insofar as [both it and pakṣa] have the same superstratum) and vaidharmya-dṛṣṭānta (i.e., dṛṣṭānta insofar as [both it and pakṣa] do not have the same superstratum), namely,

2.11 *S* Hetoḥ sapakṣe eva asti-tvam.

2.11 *E* Existence of [superstratum] *H* only in sapakṣa.

and

3.11
S Sādhya-abhāve hetoḥ abhāvah eva.

3.11 Whenever there is [superstratum] -*S*-absence, there is absence of
E   [superstratum] *H.*

First, let us denominalize 3.11. To do this, we must avail ourselves of relative pronouns as follows:

3.12 Yasmin arthe sādhya[-dharmaḥ] na asti tasmin hetu[-dharmaḥ] na
S   asti eva.

3.12 [Superstratum] *H* is not in a substratum in which [superstratum] *S* is
E   not.

That the expression "tasmin arthe yasmin" ("in that substratum in which") is to be construed as meaning some substratum is shown by the particle "eva" ("only"); for, as we saw above, the position of this particle in a simple copulative Sanskrit sentence indicates the relation which obtains between the two classes. In this case, it indicates that the class of substrata in which superstratum *S* does not occur and the class of substrata in which superstratum *H* does occur overlap — a state-of-affairs which the negative particle (that last in the Sanskrit and the first in the English) negates. The fact that 3.12 corresponds to 3.4 shows, furthermore, that the set of substrata which satisfy the criterion expressed by the third form of trirūpa is identical with the set any of whose members may be named as a vaidharmya-dṛṣṭānta (i.e., dṛṣṭānta insofar as [both it and pakṣa] do not have the same superstratum) in its second sense (cf. p. 364 above). Secondly, let us denominalize 2.11.

2.12 *S* Hetoḥ sapakṣe eva asti.

2.12 *E* [Superstratum] *H* is in sapakṣa only.

This differs in generality from 2.21 and in unequivocality from 2.2. Clearly, the class of substrata which satisfy the criterion expressed by the second

form of trirūpa is identical with this class any of whose members may be named as sādharmya-dṛṣṭānta (i.e., dṛṣṭānta insofar as [both it and pakṣa] have the same superstratum) in its third sense (cf. p. 364).

Now, if pakṣa cannot be its own sādharmya-dṛṣṭānta (in its second sense), as there is every reason to believe, then pakṣa cannot be its own sapakṣa, for the set of substrata circumscribed for each is the same. It is for this reason that Śankarasvāmin defined "vipakṣa" as "yatra sādhyam na asti" ("where [superstratum] S is not") but did not define "sapakṣa" simply as "yatra sādhyam asti" ("where [superstratum] S is"). To preclude pakṣa from satisfying the definition of "sapakṣa," one must construe "samāna" ("similar"), when it is true of two objects, to be true of two different objects: in other words, nothing is similar to itself. Therefore, the fundamental division of substrata is not bipartite between sapakṣa and vipakṣa, which division, though disjoint, is not exhaustive,[48] instead, the fundamental division of substrata is a tripartite one among pakṣa, sapakṣa, and vipakṣa, which division is both exhaustive and disjoint.

The inverse of the erroneous view that the second and third forms of trirūpa are logically equivalent is the equally erroneous view that section ∅.222[49] gives the conditions under which the major premisses of an inference are false. If the inverse view were true, then the subsections of ∅.222 would be assigned as follows to the diagrams adduced above (cf. Figure 1).[50]

∅.2221 (1)

∅.2222 (5)

∅.2223 (7)

∅.2224 (3)

∅.2225 (9)

∅.2226 (4)

∅.2226 (6)

But what is described in passage ∅.2222 does not correspond to what is depicted in diagram (5). Why? because, on the one hand, what diagram (5) depicts is a situation in which none of the substrata have superstratum H but

every substratum either has or has not superstratum *S*; while on the other hand, what is described in passage ∅.2222 is a condition in which only one of the substrata has superstratum *H*, namely pakṣa, while every substratum either has or has not superstratum *S*. In other words, in the diagrams, the substrata of the world are partitioned into disjoint classes, those which have superstratum *S* and those which do not; but, in section ∅.2222, the substrata of the world are partitioned into three disjoint classes, the substratum which is pakṣa, the substrata other than pakṣa which have superstratum *S*, and the substrata other than pakṣa which do not have superstratum *S*.

What evidence is there that this tripartite division underlies passages ∅.2222? The text itself! It states:

> Tat hi nitya-a-nitya-pakṣābhyām [hetoḥ] vyāvṛtta-tvāt nitya-a-nitya-vinirmuktasya ca anyasya a-sambhavāt saṃśaya-hetuḥ.

> There is reason for doubt because [superstratum *H*] is excluded from both pakṣa which is eternal [i.e., sapakṣa of the example] and pakṣa which is not eternal [i.e., vipakṣa of the example] and because what is other [than pakṣa which is eternal and pakṣa which is not eternal] to be different from both what is eternal and what is not eternal is impossible.

What is crucial here is the expression "what is other" ("anya").[51] The expression invites the question: other than what? And the grammar of the sentence gives the answer: other than both pakṣa which is eternal and pakṣa which is not eternal. And the pair of pakṣa referred to here are sapakṣa and vipakṣa respectively.[52] These pakṣa do not include every substratum, for then the expression "what is other" ("anya") would fail to denote any substratum, a result which would render the sentence senseless. But obviously the expression denotes pakṣa.

As a result, we see the following: while sections ∅.2221 and ∅.2223 through ∅.2226 give examples and descriptions of the conditions wherein the major premises of an inference are rendered false, that is, wherein the third form of trirūpa is violated; section ∅.2222 gives an example and

description of the condition wherein no substratum other than pakṣa has both a super-stratum *H* and superstratum *S*, that is, wherein the second form of trirūpa is violated.

III

We are now ready to begin the last part of this paper. Here, as promised at the outset, we shall assess the degree to which Śaṅkarasvāmin has succeeded in articulating the structure to which he had addressed himself in the *Nyāya-praveśa.* In particular, we shall state and show the extent to which Śaṅkarasvāmin has managed, if at all, to distinguish the various level of structure circumscribing his subject-matter.

We contend that Śaṅkarasvāmin failed to distinguish between the dialectic and forensic levels as well as between the ontic and epistemic ones. Moreover, we contend that although he did distinguish the dialectic level from the epistemic one, nonetheless, he failed to distinguish them properly.

Let us demonstrate the second claim first. We remind the reader of the opening lines of the work (i.e., ∅) where Śaṅkarasvāmin states:

> Sādhanam dūsanam ca eva sa-ābhāsam para-samvide; Pratyakṣam anumānam ca saābhāsam tu ātma-samvide.

> Argumentation and refutation together with [their] semblances pertain to another's knowing; perception and inference together with [their] semblances pertain to one's own knowing.

Here we see described by Śaṅkarasvāmin precisely that which separates the epistemic from the dialectic, namely, an observer of the world augmenting his own set of beliefs as opposed to an observer augmenting the set of belief of another observer. However, that he failed to abide fully by this distinction is shown by his definition of inference (anumāna):

> Anumānam liṅgāt artha-darśanam. Lingam punar trirūpam uktam.

Inference is the apprehension of a state-of-affairs through [the apprehension of] a mark. Furthermore, a mark is said to have three forms.

Here, we are told that the conclusion of an inference (anumāna) is determined merely by trirūpa; above, we saw that the conclusion of an argument (sādhana) is determined by more than just trirūpa. Now, if examples are irrelevant to inference, as they are neither discussed nor even alluded to when Śankarasvāmin broaches inference, then trirūpa, whose second condition is stated as a restriction to eliminate arguments in which Major Premiss 2 fails to have an example which must be (other than pakṣa itself) satisfying it, fails to sustain the separation between the dialectic level on the one hand and the epistemic on the other.

How might such a confusion come about? We recall that the definitions of sādharmya-dṛṣṭānta (i.e., dṛṣṭānta insofar as [both it and pakṣa] have the same superstratum) and vaidharmya-dṛṣṭānta (i.e., dṛṣṭānta insofar as [both it and pakṣa] do not have the same superstratum) capture the set of substrata from which an example can be drawn for Major Premiss 2 and Major Premiss 1 respectively. We also recall that the term dṛṣṭānta is ambiguous, denoting, among other things, either an example or its major premiss. (Cf. p. 363). It is easy to imagine that one could mistake the description of the set of substrata which are dṛṣṭānta *(qua* example) for the set of substrata which satisfy dṛṣṭānta *(qua* major premiss). In the case of vaidharmya-dṛṣṭānta (i.e., dṛṣṭānta insofar as [both it and pakṣa] do not have the same superstratum), the error makes no difference; but in the case of sādharmya-dṛṣṭānta (i.e., dṛṣṭānta insofar as [both it and pakṣa] have the same superstratum), the error is crucial.

Our first claim, to which we now return, is itself composed of two other claims, namely, that Śankarasvāmin failed to discern between the dialectic and forensic levels, and that he failed to discern between the ontic and epistemic ones. The former claim is substantiated by the fact that Śankarasvāmin mixes together forensic and dialectic considerations. Specifically, in sections ∅.211 through ∅.215 he cites cases where sādhana

(argumentation) fails because the observer who is undertaking to add beliefs to the set of beliefs of another observer has himself acquired a belief which renders his set inconsistent. (Cf. pp. 355–356.) While the acquisition of this belief accrues to a fact of the dialectic level, the inconsistency resulting from this acquisition is pertinent only to the forensic level. The latter claim is substantiated by the fact that Śankarasvāmin is confused about the ontic structure underlying the epistemic and dialectic structure of his subject-matter. We recall that in those passages where ontic facts bear on dialectic and epistemic ones (namely, $\varnothing.12$ and $\varnothing.222$), Śankarasvāmin has only nine cases in mind. We know from our earlier discussion that a world whose substrata are divided into those having superstratum S and those not having superstratum S can be distributed only in nine ways with respect to occurrences of superstratum H. (Cf. p. 365.) Yet we also know from our previous examination of one passage (namely, $\varnothing.2222$) that Śankarasvāmin has in mind at least one case wherein the occurrences of superstratum H are distributed with respect to substrata, divided into those other than pakṣa having superstratum S, those other than pakṣa not having superstratum S, and pakṣa. (cf. p. 376.) This confusion between a bipartite and tripartite view of substrata of the world shows that the ontic level had yet to come under isolated scrutiny by Śankarasvāmin.

What we see here in the *Nyāyapraveśa* are four levels of structure, well-circumscribed but incompletely understood. This compendium of imperfect knowledge of earlier Indian logicians turns out to be a source of new insight for later Indian logicians. Of special interest is this fact. In Navya-nyāya the attempt to define the relation of pervasion (vyāpti) in terms of a tripartite division of substrata into pakṣa, sapakṣa, and vipakṣa is abandonned; instead later Indian logicians resort directly to superstratum H (hetu-dharma), superstratum S (sādhya-dharma), and substratum (adhikaraṇa). Of course, new problems arise at that point and these will be discussed in a similar study planned for another compendium of logic in India, the *Tarkasamgrahadīpika*.

ACKNOWLEDGMENTS

Notes

* An essay on the *Nyāyapraveśa* was written by me at the University of Toronto during the winter of 1977–1978. Later, when Martha Lile Love and I were engaged in research at Poona University, we developed a framework in which to put the results of our work. To assess the viability of our framework, we searched for a suitable text with which we had some competence. The *Nyāyapraveśa* turned out to be such a text. What began as the revision of my essay became the creation of a new essay. Tragically, before we could complete our final draft, Martha died. Belatedly, I have put the final touches on our manuscript.

1 For those familiar with the jargon, the distinction here is between object-language and observer-language (or, metalanguage): illustrations are specimens of the object-language, the structure of which specimens the author is trying to describe in an observer-language.

2 Tachikawa (tr) (ed) 1971.

3 Dhruva (ed) 1930.

4 Just as "epistemic" characterizes that which pertains to knowledge, as opposed to "epistemological" which characterizes that which pertains to the study of knowledge; so "ontic" characterizes that which pertains to being, as opposed to "ontological" which characterizes that which pertains to the study of being.

5 We are trading on the sense of "dialectic" as it pertains to the Socratic dialogues, where Socrates is depicted as eliciting beliefs from his interlocutors.

6 By the word "forensic," we intend to emphasize the sense of debate: argument for the sake of winning.

7 Where possible we have provided a Sanskrit word from the text, one of the meanings of which corresponds to the key concepts expounded in Part I of the essay.

8 Note this equivalence, as it will be used frequently and tacitly in the exposition to follow.

9 "[Hetu-dharmasya] vipakṣe ... asattvam": "[Superstratum H] is not in vipakṣa [i.e., substrata where superstratum S is not]" (in $\varnothing$.12(a)).

10 "[Hetu-dharmasya] pakṣa-dharmatvam": "[Superstratum H] is a superstratum in pakṣa. [i.e., substratum p]" ($\varnothing$.12(a)).

11 An example of this structure is embedded in the example given in $\varnothing$.1(b).

12 Faris 1962 Chapter 1, Section 2; Faris 1964 Chapter 2, Section 1.

13 "Pratyakṣam anumānam ca sa-ābhāsam tu ātma-samvide": "Perception and inference together with [their] semblances pertain one's knowing" (in ∅). "Atma-pratyāyana-artham tu pratyakṣam anumānam ca dve eva pramane": "Perception and inference, by which one convinces onself [of some fact], are the only two means to knowledge" (in ∅.∅(a)).

14 This point will be discussed below in part II.

15 The substantiation of this claim lies in the author's rejection of arguments wherein the observer who is propounding an argument argues for a belief which the other observer already accepts. Cf. ∅.219.

16 "Esām vacanāni para-pratyāyana-kale sādhanam": "Argument is such statements [uttered] when one is trying to convince another" (in ∅.1(b)).

17 Cf. ∅.131 and ∅.132. Note that p.2311 through ∅.2313 and ∅.2321 through ∅.2323 are examples where this requirement is not met.

18 This is exemplified in ∅.1(b).

19 Cf. ∅.11. Notice that ∅.216 through ∅.218, ∅.2211, ∅.2212, and ∅.2214 are examples where this requirement is not met.

20 That debate has a game-theoretic structure is evident. What the structure is in the case of debate in India is not evident, however. The structure we are ascribing to debate as alluded to in the *Nyāyapraveśa* is speculative, for it is an extrapolation which goes beyond the evidence of the text alone.

21 Cf. ∅.2213.

22 Cf. ∅.7 and ∅.8.

23 Cases adduced by the author to illustrate violations of this restriction are given in sections ∅.211 through ∅.215.

24 Cf. Chatterji, (ed) 1933 p. 269.

25 That is, ∅.223 as emended above.

26 Sanskrit authors rarely state an argument in its full form. In recasting arguments into their full form, we have only supplied what can be recovered from the abbreviated expression of the argument. Omissions of certain lines should not be taken as an error in the argument, but simply as the deletion of inessential information.

27 Tachikawa (tr) 1971 p. 135.

28 Our translation of this passage (∅.2231) differs from that of M. Tachikawa.

29 Tachikawa (tr) 1971 p. 136.

30 Again, our translation of this passage (∅.2232) differs from that of M. Tachikawa.

31 Tachikawa (tr) 1971 p. 138.

32 This argument is so egregiously spurious that we believe it to have been included here merely for the sake of symmetey between the final two cases and the first two cases.

33 Whatever is the pakṣa (in sense 3) is the referent of a genitive pronoun ellipsed in the hetu (in sense 1).

34 That is, the deduction-schema, to be meaningful, must have rules which interpret what the various symbols in it mean. Cf. Fans 1964 Chapter 8, Section 2.

35 In talking about Dharmakīrti's formulation in the *Nyāya-bindu* of trirūpa, which corresponds almost verbatim to Śankarasvāmin's formulation, Staal states: "Thus it was recognized that the second and third conditions are equivalent and that this equivalence constitutes a logical relationship, namely, contraposition" (Staal 1969 p. 636). Cf. Fans 1962 Chapter 3, Section 8.

36 The growth in use of nominalization in Sanskrit literature has been shown in Bloch 1906.

37 The deletion of content through nominalization is discussed in Leech 1974 pp. 185–188.

38 To aid those who are not conversant with Sanskrit to follow what we are arguing for, we have provided quasi-English translations for each Sanskrit sentence.

39 Rules for nominalization, and hence for denominalization, are found in Staal 1965.

40 If one follows the Chinese version of ∅.12(b), as we do, the first part of the Sanskrit sentence (in which Śankarasvāmin illustrates his discussion of ∅.12) would read as follows: "… kṛtakatvam prayatnānantariyakatvam vā pakṣe asti…"

41 Cf. ∅.12(b): "… kṛtakatvam prayatnānantariyakatvam vā … vipakṣe na asti eva."

42 Cf. ∅.12(b):… kṛtakatvam prayatnānantariyakatvam va … sapakṣe eva asti…

43 Note that "samāna" denotes qualitative identity but "samāna" in "sāmānya" denotes numerical identity. Cf. in English: "The automobile accident at this intersection this week is the same as the one here last week" and "The person who drove the car is the same as the one who ran from the scene of the accident." Notice that the word "samāna" in "sāmānya" must mean "identical," otherwise there would have to be another clause to specify a property of the two similar properties in virtue of which the two similar properties are similar.

44 While we agree with Staal's formulation of the two forms of trirūpa into symbols, we do not agree that the two formulae are logically equivalent. That they are not logically equivalent is shown above. The error in Staal's deduction lies on p. 636 (Staal 1960) at the top, where the transformation of the first formula to the second as well as the second to the third is incorrect. The first transformation rests on the false claim that $(x)\,Fx \to (x)\,Gx \vdash (x)\,(Fx \to Gx)$, and the second transformation violates the rule of Universal Generalization.

45 Cf. Suppes 1957 Chapter 9.

46 Cf. Quine 1950 Chapters 14 and 15.

47 The source of this analysis are verses 190–192 in Chapter 4 of Dharmakīrti's *Pramānavarttika*. This passage is discussed in Kajiyama 1973 on pp. 162–167, but the discussion is erroneous in some crucial respects. A more comprehensive review of this use of the particle "eva" as it is expounded by logicians and grammarians will be found in a forthcoming article now under draft by Richard Hayes and me.

48 Two classes are disjoint when they have no members in common; and they are exhaustive when between them they include every member of the domain.

49 In treating this section, we presuppose the emendation made above. Cf. p. 357.

50 The two examples cited in ∅.12(b) correspond to diagrams (2) and (8).

51 Tachikawa (tr) 1971 p. 124. Tachikawa mistranslates it as "anything."

52 This interpretation is corroborated by the Chinese translation, as pointed as in Staal 1971, pp. 165–165.

/ means that the passage has been discussed and translated.

o means that the passage has only been adduced as evidence and not regarded as problematic.

x means that the passage is organizational and has no direct bearin on the content of the work.

? means that we are undecided as to the import of the section.

In columns three and four, 'd' and 't' refer to Dhruva (ed) 1930 and Tachikawa (tr) 1971 respectively; the number before the decimal point refers to the page and the number after it refers to the line of that page.

Some features of the technical language of Navya-Nyāya

Sibajiban Bhattacharyya

I. INTRODUCTION

Navya-Nyāya is not just one school among other schools of Indian philosophy. This is primarily because Navya-Nyāya philosophers developed a technical language which became the language of all serious discourse. This language, developed within the language of realistic Vaiśeṣika ontology, was, however, found to be ontologically neutral, and was used not merely in different philosophies—for example, in Advaita Vedānta by Madhusūdana Sarasvatī, in *Advaita Siddhi*; in Pūrva Mīmāṁsā by Khaṇḍadeva, in *Bhāṭṭa-Rahasya*; in Sāṁkhya and Śākta philosophies by P. Tarkaratna, in *Pūrṇimā* and *Śaktibhāṣya;* and so forth,[1]—but also in grammar, philosophy of language, poetics, law, and other branches of study. We shall have to explain how this language could be so universally used.

In contemporary Western philosophy, the language of symbolic logic has been developed and is used extensively not merely in logic and mathematics, but also in biology and other physical sciences, in grammar (especially the grammar of formal languages), in economics, and only marginally in epistemology, ethics, and law. The discovery and development of the arithmetization of syntax and recursive function theory led to the development of Turing machines and other machine languages, which have been indispensable in computer programming. Thus the thrust and tenor of technical languages developed in the West have been mainly scientific; the

application of the languages to poetics or philosophy has been almost absent. This contrast between the technical language of Navya-Nyāya and symbolic logic points to an important difference between the humanities and the sciences, which we discuss below.

The technical language of Navya-Nyāya is nonsymbolic but rigorous, and is a development of Sanskrit, just as Western syntax and semantics must use living languages like English. It is debatable whether Sanskrit was even a living language, and when Navya-Nyāya developed, it was surely a frozen language. Sanskrit as a frozen language has close affinities with artificially constructed languages as we have them in the West. We must not lose sight of the fact that Sanskrit, from ancient times, had a very rigorous grammar, so much so that Sanskrit grammarians may be regarded as founders of the science of grammar. Sanskrit, as a frozen language, has well-defined and rigorous rules of formation from an alphabet which is phonetically arranged, and the grammatical rules are linearly ordered for scope in Pāṇini's *Aṣṭādhyāyī.* So Navya-Nyāya philosophers took advantage of this feature of Sanskrit in developing their technical language.

Navya-Nyāya language developed so that it could describe structures cognized on various occasions. Thus this language could be used in every sphere where cognition, belief, doubt, and other epistemic and doxastic factors play an essential role. This explains why this language could be used universally in the humanities, where the epistemic factors predominate. In the sciences, however, propositions are stated in total, or nearly total, independence of the knowing subject. Hence Navya-Nyāya language, which is very helpful in the humanities, does not seem to be applicable in the sciences. Although a mastery of the Navya-Nyāya language is considered essential for studying medicine (*āyurveda*), still no work of medicine has used this language. Western logic, on the other hand, developed historically so that it could be applied to mathematics and is oriented basically towards science, and is thus inappropriate for use in the humanities.

The Navya-Nyāya language is not a metalanguage in the sense of being a language about a language. It is a language that has developed so that it can *describe* a cognized structure in terms of the Navya-Nyāya theory. This

is different from ordinary Sanskrit, which is used *to express* cognized structure. Thus the distinction between expressing and describing in the theoretical language of cognized structure is fundamental. Lukasiewicz stated that Aristotle used two types of *expressions* for saying the same thing. For example, 'all A is B' or 'B belongs to all A', and 'B is predicated of all A' are used indiscriminately.[2] Yet these two types of expression are radically different. 'All A is B' and 'B belongs to all A' are *expressions* of cognized structure, but 'B is predicated of all A' is of a different type containing 'predicated of', which is a theoretical term of logic or grammar, and is not an expression of the object language of the earlier expression. In other words, while 'All A is B' expresses a factual situation, 'B is predicated of all A' cannot do so, for the relation 'being predicated of' is not a factual relation, but is a grammatical or epistemic one. Thus this sentence analyzes a fact as cognized, or a statement made according to rules of grammar. This latter interpretation makes it easy to make this sentence a sentence of a metalanguage, of grammar. According to Navya-Nyāya philosophers, 'B is predicated of all A' is a *description* or *analysis*, in terms of a theory (logic or grammar), of what 'All A is B' or 'B belongs to all A' expresses.

Hence they all belong to the same *level* of expression; they are about objects. We shall now explain the Navya-Nyāya theory in terms of which all cognized structures are analyzed and rigorously described.

II. THE NAVYA-NYĀYA THEORY

We will first explain the meaning of 'cognition'.

(1) 'Cognition' is used to denote not merely propositional acts like judging, believing, disbelieving, doubting, assuming, inferring, remembering, perceiving, and introspecting, but also nonpropositional states like sensing, and so forth. In this article, however, we shall not be concerned with cognitions like sensing.

(2) 'Cognition' is always used in the episodic sense to denote an occurrence of an act, but never in the dispositional sense. The term '*saṁskāra*' is

used for 'disposition' in general, physical as well as mental; in the context of cognition, '*saṁskāra*' is used to denote unconscious traces which, when stirred up or activated, produce conscious memory. We shall be dealing with what may be called, very roughly, propositional cognition episodes. These cognitions are called 'qualificative cognitions'.

Qualificative cognitions are cognitions the objects of which are relational complexes of the form *aRb.* We now introduce three epistemic definitions:

Definition 1.

Qualificand of a qualificative cognition: *a* in the cognized structure *aRb* is called '*the qualificand of the cognition*', as well as '*the qualificand of b*'.

Definition 2.

Qualifier (mode) of a qualificative cognition: *b* in the cognized structure *aRb* is called 'the qualifier (mode) of the cognition' as well as 'the qualifier (mode) of *a*'.

Definition 3.

Qualification of a qualificative cognition: *R* in the cognized structure *aRb* is called 'the qualification of the cognition'.

Every qualificative cognition of a structure of the form *aRb* is interpreted in Navya-Nyāya theory as the cognition *of **b**in a by **R**.* Thus 'aRb' is a term, and not a proposition in the usual Western sense. The Navya-Nyāya theory is that every qualificative cognition has to be analyzed as a cognition of something *in* something, of something *possessing* something, of something *as* something, that is, something cognized under the mode of something. In the Western tradition generally, every proposition, including relational propositions of the form *aRb*, is interpreted as *assertions* and is

distinguished radically from a term. In Navya-Nyāya theory, *a*, as well as the structure *aRb*, is regarded as a complex object, and not as a proposition or fact in the sense of the *Tractatus.* We now introduce two *ontological* definitions.

Definition 4.

Property (superstratum): *b* is a *property (superstratum) of a in the relation Rin **aRb**.*

Definition 5.

Property possessor (substratum, locus): *a* is the property possessor (substratum, locus) *of b in the relation **R**in **aRb**.*

In a cognized structure of the form *aRb*, one cognition is related to the three elements by three characteristic relations (diagram 1).

Diagram 1

Cognition of aRb

R_1 R_2 R_3

a R b
The converse relations, $R^{\smile}_1$, $R^{\smile}_2$, $R^{\smile}_3$, are relations of the objective factors to the cognition.

III. THE NAVYA-NYĀYA TECHNIQUE

Abstraction

Usually in Sanskrit, as in English, abstract terms are formed from given concrete terms, and concrete terms from given abstract terms. Thus, from the concrete terms "wise," "honest," and "man" we have the following abstract terms by adding the appropriate abstraction suffixes, making appropriate grammatical changes in the stem where necessary: "wis-dom," "honest-y", "man-ness." So also with given abstract terms.

But Navya-Nyāya philosophers form abstract and concrete terms from *any* terms. Thus there will be higher-order abstract terms formed from given abstract terms, and similarly higher-order concrete terms from given concrete terms.

The abstraction suffix is '—tva' or its grammatical variant '—tā' (translated as '—ness'), and the concretization suffix is '—vat' or '—mat' (translated as '—possessing'). Abstraction and concretization are inverse processes in the sense that

$$AC\,1. \quad \begin{aligned} &\text{(t-ness) possessing} = t \\ &\text{(t possessing)-ness} = t \end{aligned}$$

where 't' is any term whatsoever, corresponding to the law of symbolic logic:

$$AW\,2. \quad [(\lambda x)Fx]. = F$$

Determiner-Determined

In *aRb, a is* the locus of *b* (definition 5), and therefore *has the property of being the locus* (*locus-ness*) resident in, that is, belonging to, *a.* So also *b* is the superstratum of *a* in the relation R (definition 4), and has the property *being the superstratum* (*superstratum-ness*). To say *a* is the locus *of b* is, in Navya-Nyāya terminology, to say that the locus-ness resident in *a is*

determined by the superstratum-ness resident in *b*. Thus the determiner-determined relation is between properties of two correlatives. In symbols,

$$(\lambda x)xRy \text{ determines (or is determined by)} (\lambda y)Rxy.$$

In thus symbolizing the Navya-Nyāya concept we have to use 'R' in both the abstracts. But in Navya-Nyāya technical language *R* goes with the successor of R, but not with the predecessor.

The structure *aRb*, which is interpreted as *b* in *a* by *R*, is described by S1 in theoretical terms of the Navya-Nyāya system thus:

> S1. *R* is the *limiting relation* of superstratum-ness resident in *b*, which superstratum-ness determines the locus-ness resident in *a*.

We now explain the concepts of limiting properties and limiting relations, that is, of limitors.

IV. THE CONCEPT OF LIMITOR

Navya-Nyāya, in developing its theory of cognition, uses the concept of limiting property and limiting relations almost continuously. In ontology, Navya-Nyāya accepts extensionality of properties, classes, relations, and so on. If two properties belong to, are located in, exactly the same objects, then they are ontologically identical. But this ontological identity cannot ensure the identity of cognized structures. One and the same object may be cognized differently, that is, through different modes of cognition. Now this theory that the same object can be cognized in and through different modes has been challenged by many philosophers. Findlay, for example, argues as follows:

> The same object can be referred to in many ways; we can think of the same city as the birth-place of Mozart or as the city which stands on the site of ancient Juvavum; the difference between the two ideas which we thus form of one and the same object, must lie in the content of those ideas. The weakness of this argument lies in the fact

that it seems fairly clear that there is some difference even in the *objects* of the two ideas; if they concern the same city, they certainly also introduce us to other objects and relations which would suffice to distinguish them. For Mozart and ancient Juvavum are as much objects as the modern city of Salzburg.[3]

The reply to this objection of Findlay is to point out that the two ideas (cognized objects, in Navya-Nyāya terminology) which refer to the same object are ontologically the same, since the identity statement 'the birth-place of Mozart = the city which stands on the site of ancient Juvavum' is a true statement. The truth in Findlay's objection can be expressed in Navya-Nyāya theory of cognition in this way. The cognition of the birthplace of Mozart has the city of Salzburg as its qualificandum, and the property *being the birthplace of Mozart* as its qualifier or mode; the cognition of the city which stands on the site of ancient Juvavum has as its qualificandum the same city, and as its qualifier the property of being the city which stands on the site of ancient Juvavum. Thus both cognitions have the same qualificandum, but they differ in their qualifiers or modes of cognition. Thus, according to Navya-Nyāya, the same object, that is, the same qualificandum, may be cognized through different modes. These modes are properties which belong to objects and are as objective as the objects themselves.

This theory that the same qualificandum may be cognized in and through different modes has a parallel in the theory of *ratio* of the fourteenth-century logician Jean Buridan:

All the same the sense, or as Buridan calls it *ratio*, given us by an object expression really is somehow involved when the verbal is an intentional one; Buridan says the object expression appellat *suam-ratioem* where we may perhaps render the term '*appellat*' (perhaps the most obscurely and multifariously employed of all medieval semantic technicalities) by saying the expression 'calls up' or 'evokes' its own *ratio*. Buridan's main point is in any case clear: that the truth-value of a sentence whose verbal is an intentional one may be changed if we change the *ratio*, the sense, given in the object

expression, even if their expression still relate to the same thing in the world.[4]

Buridan here talks of ratio, that is, of aspects of objects referred to by expressions. Although Navya-Nyāya also formulates a theory of word meaning according to which a word refers to an object only under a specific mode or aspect, still Navya-Nyāya generalizes this distinction between an object and an aspect to all cognitions. The Navya-Nyāya philosophers hold the theory that all cognitions involving language essentially are a special kind of cognition. Neither perception nor even inference as a process of knowing involves any language. When one wants to communicate to others what one has cognized in perception and in inference, one uses language. In these cases, one needs language only in order to communicate one's cognitions or to discuss their truth or falsity or their nature with others. With this modification and generalization, the Navya-Nyāya concept of mode is much wider than Buridan's conception of *ratio.*

The word 'limitor' has been used in Navya-Nyāya in various senses. We shall explain here two most important uses of this important concept. (a) *In the first sense,* the word 'limitor' is used to denote the mode of cognition of an object. Thus, when one cognizes a jar under the mode of jar-ness, jar-ness becomes the limitor of the qualificandum-ness resident in the jar. This simply means that the thing jar has become the qualificandum of the cognition only insofar as it possesses jar-ness, that is, insofar as it is an instance of the universal jar-ness. As Navya-Nyāya philosophers deal with cognitions and as cognitions are transparent to introspection, there can be no doubt about what mode has been manifest in a particular cognition. Thus the limiting property of the qualificandum-ness of any cognition is always infallibly known to the knower.

The difficulty arises when one has to determine the limitor from the verbal expression of the cognition; for example, when one cognizes a particular jar as an instance of the universal jarness, what one says is '(a) jar'. Now the word 'jar' refers to the thing jar under the mode of jar-ness. Thus jar-ness is the mode of presentation of the referent of 'jar', namely,

jars. One may cognize the same thing, namely, the jar, as something containing water. If to express this cognition one uses the word 'the jar', then, of course, the mode of cognition is not the mode of presentation of the referent of the word 'the jar'. For the mode of presentation of the referent of a word is conventionally fixed, whereas a cognition of a thing may have different qualifiers at different times. As the linguistic expression of a cognition does not always give a foolproof method of determining the mode of cognition of its object, Navya-Nyāya has devised a technical language which is adequate to express the limiting properties as well as the limiting relations of cognitions. Thus, when one cognizes a particular jar as containing water, this cognition is described as follows:

> The cognition which has the thing jar as its qualificandum and the property of containing water as its qualifier.

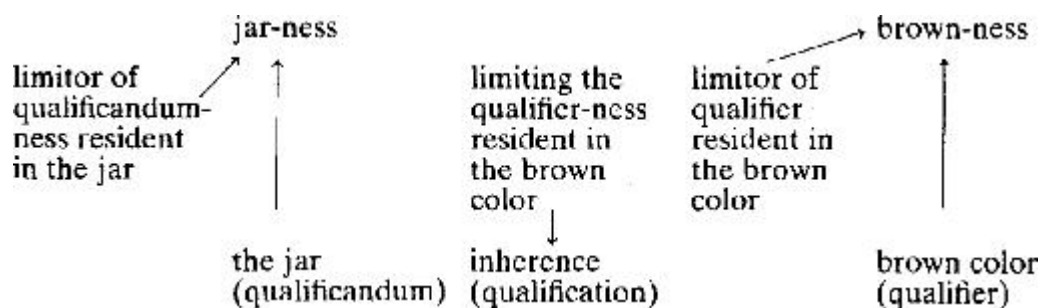
When one cognizes, that is, perceives, a particular brown jar and expresses this cognition by '(a) brown jar', this cognition is described in the technical language of Navya-Nyāya thus:

> *First step.* The cognition the qualificandum of which is the (thing) jar and the qualifier of which is brown color.

But again the (thing) jar has been cognized as a jar, that is, under the mode of jar-ness, and the brown color has been cognized under the mode of brownness. Hence the entire cognition stated in the technical language of Navya-Nyāya becomes:

> *Second step.* The cognition having its qualifier-ness, which is limited by brown-ness and the relation of inherence, and which determines the qualificandum-ness limited by jar-ness.

This simply means that the thing jar has become the qualificandum of the cognition only insofar as it has jar-ness, and the brown color has become its qualifier only insofar as brown-ness *inheres* in it. This may be explained by means of diagram 2.

Diagram 2


The qualificandum-ness resident in the jar is determined by the qualifier-ness resident in the brown color. This is because the jar is the qualificandum *of* the qualifier, the brown color. The qualifier-ness resident in the brown color = the qualifier-ness limited by brown-ness and inherence. The qualificandum-ness resident in the jar = the qualificandum-ness limited by jar-ness. Hence the entire cognition is the cognition the qualifier-ness of which is limited by brown-ness and inherence and which determines the qualificandum-ness limited by jar-ness.

An important point to be noted here is that although the mode of cognition becomes the limitor, it is a limitor only of a relational property residing or located in the object referred to by the word. Any object becomes the qualificandum or the qualifier of a cognition only under some mode. This mode is the limitor of qualificandum-ness or qualifier-ness, but not of the qualificandum or of the qualifier. So, also, when an object is the cause of another object, the modes under which the cause and the effect are cognized become the limitors, not of the cause and the effect, but of the properties of being the cause (cause-ness) and the property of being the effect (effect-ness). Thus, generally, when any object, *a*, is related to another object, *b*, by a relation *R*, *a* has the property of being the first term of *R* and *b* the property of being the second term of *R*. The modes under which the objects *a* and *b* are cognized become the limitors of *these properties*. Thus we can never have a definiendum like 'xRy' but only something like: 'x cognized under the mode F is related to y cognized under the mode G by the relation *R*'. This explains the function of the limitor. In *aRb, a* has the property being the predecessor (predecessor-ness), and *b* the property of the

successor-ness, of *R*. In *cRb*, *c* has predecessor-ness, and *b* the successor-ness, of *R*. How can one distinguish the predecessor-ness resident in *a* from the predecessor-ness resident in *c*, especially when *R* is the same in both cases? As concrete examples, we may have: this is a mango (this has mango-ness) and that is a mango (that has mango-ness), where *R* is inherence and *b* is the universal mango-ness, which is the same in both cases. The difference in the predecessor-nesses resident in *a* and *c* is due to the *limitors* of the two predecessor-nesses. In the first case, the predecessor-ness is limited by *a*-ness (this-ness), and in the second case it is limited by c-ness (that-ness). Thus the limitors differentiate between predecessor-nesses and successor-ness residing in different objects.

What is limited by the limitors may be of two kinds. The word *avacchinna* (limited, determined) is used not only for a relational abstract which is limited by the mode of cognition of the term related, but also for a "thing's nature which is determined" by the mode of cognition of the thing. "The nature determined" by the mode of cognition is "forma cum subjecto represented by the concrete concept of the thing"; the mode of cognition is "the forma sine subjecto represented by the abstract concept of the thing."[5] For example, water cognized as water, that is, under the mode of water-ness, is said to be limited by water-ness. In 'absence of (a) jar' there is an ambiguity; the meaning may be 'absence of a particular jar' or 'absence of all jars'. This ambiguity is resolved by use of limitors in a different sense, which we shall explain presently. The point is that the sense of limitor as a mode of cognition does not show the quantity of what is cognized.

This sense of 'limitor' as the mode under which an object is cognized so that it can be related to another object does not give us any indication of the quantity of the relational cognition. Thus to say 'cognized under the mode of fire-ness', that is, 'limited by fire-ness' (*vahnitvā 'vacchinna*), does not give us any indication whether the object cognized is just one particular fire or all fires. Here an adjective of quantity like 'all' has to be added. Thus, for example, Jagadīśa writes "*vahnitvâvacchinnasya sarvasyaiva*."[6] The addition of '*sarva*' ('all') here is lost in Guha's interpretation.[7] Viśvanātha also writes "*pratiyogitâ 'vacchedakâ 'vacchinnasya yasya kasyacit pratiyogino*

'nâdhikaraṇatvaṁ, tatsāmānyasyā va. ..."[8] The question of the opponent which Viśvanātha is explaining here concerns the ambiguity of the expression 'counter-positive limited by the limitor of the counterpositiveness'. Does it mean just *some* such counterpositive entity—or all?[9]

Now there is a second sense of 'limitor', in which it is used to indicate quantity of cognition. There are two types of reasons, ontological and epistemic, for admitting limitors of relational properties over and above the relational properties themselves. It is only the epistemic reason which explains here how the concept of limitor is used to show quantification. In this respect, the Navya-Nyāya theory of limitors is fundamentally different from Buridan's theory of *ratio.* Now we explain the two types of reasons, ontological and epistemic, for admitting limitors of counterpositive-ness.[10] These reasons may be used *mutatis mutandis* in other cases of relational properties.

Ontological Reasons

The sentence or the proposition 'the chair is on the floor' is contradicted by 'the chair is not on the floor'. This relation of contradiction between the two propositions or sentences is, according to Navya-Nyāya, grounded in or based on a relation of incompatibility between two entities, the chair and the absence of the chair. According to Navya-Nyāya, a cognition of the form '*a* is not *b*', or '*a* is not in *b*', is a cognition of negation of *b* in *a*. Now to say that *b* is absent from *a* requires that we specify what it is for *b* to be present, certainly not in *a*, but in some other object, say *c*; unless it is specified what it is for *b* to be present, we cannot say what it is for *b* to be absent. Now to be present *b* has to be related by a specific relation to *c*. To say that *b* is not present in *a* will necessarily involve the relation in which *a* is present in *c*; *b* is not present in *a* in the way that it is present in *c*. This relation is the limiting relation of the counterpositive-ness resident in *b* and in determining the locus-ness resident in *a*. If we do not include this specific relation in

which *b* is said to be present in *c* in this case, then there cannot be any incompatibility between presence and absence of *b* and no contradiction between the corresponding propositions. For example, the two propositions 'the chair is on the floor' and 'the chair is not on the floor' will not be contradictory to each other if 'being on the floor' in the two propositions is understood differently. Even though the chair is in contact with the floor, still the chair will not be related to the floor by the relation in which the chair is related to its parts. The chair inheres in its parts but cannot inhere in the floor because the floor is not a part of the chair. So both the propositions 'the chair is on the floor' (by contact) and 'the chair is not on the floor' (say, by inherence) will both be true and hence not contradictory. Navya-Nyāya, therefore, postulates that whenever a cognition of negation is considered, it is necessary to take into consideration this specific relation by which the counterpositive is to be present somewhere.

The ontological reason for admitting a limiting property of the counterpositive-ness resident in the counterpositive of a negation is this: Consider the proposition 'there is a substance'. If we do not specify here the mode under which a substance is to be cognized, the two propositions 'there is a jar on the ground' and 'there is no chair on the ground' will not be contradictory even though both jars and chairs are substances. It may be suggested here that this difficulty may be avoided by stipulating that what is said to be present on the ground must be the the same as that which is said to be absent there. But this answer without bringing in the concept of the limiting property of counterpositive-ness—that is, the concept of the mode under which the counterpositive of a negation is cognized—is inadequate from the Nyāya point of view. This is because, in ontology, Navya-Nyāya accepts the principle that an entity qualified by some other entity is ontologically identical with the unqualified entity. For example, existence (*sattā*) inheres in three categories: substance, quality, and motion. Now this existence qualified by exclusion from quality and motion is ontologically the same as existence pure and simple. Yet existence qualified by exclusion from quality and motion is not present in quality and motion where existence is present. Thus quality and motion are the loci of both existence and absence

of existence. This violates the rule of incompatibility between an object and its negation. The rule is that where the object is present it cannot be also absent, and vice versa. Existence which is not present in quality and motion is existence qualified by exclusion from quality and motion. But because the qualified existence is ontologically the same as unqualified existence, that is, existence pure and simple, existence and nonexistence cease to be incompatible. It is, therefore, necessary to introduce the concept of limitor of counterpositive-ness, which is the mode under which the counterpositive of a negation is cognized[11] and which is, therefore, an epistemic concept. Thus even though qualified and unqualified existence be ontologically identical, still, in cognition, they are cognized differently through different modes of cognition. Thus, in order to ensure the relation of incompatibility between an object and its negation, the notion of the limiting property of counterpositive-ness is necessary.

Epistemological Reasons

According to Navya-Nyāya, a cognition of an object blocks or prevents the cognition of its absence under certain conditions. Now this blocking of one cognition by another is possible only when the limiting relation of counterpositive-ness resident in the counterpositive and the limiting property are essentially involved in the cognitions. Just as without these limitors there is no incompatibility between an object and its negation, so also without these limitors there will be no blocking of one cognition by another.

Now we explain how the concept of limitor is used in Navya-Nyāya to specify the quantity—universality or particularity—of cognitions. For this purpose the word 'limitor' is used in an altogether new sense. This sense is that the limiting property is coextensive with the relational property that is limited by it.[12] For example, in the negation of a jar, if the counterpositiveness resident in the jar is limited by jar-ness than it will be the negation of jar-in-general or negation of all jars. But if the

counterpositive-ness is limited by (this-jar)-ness, then the negation will be the negation of this jar, that is, negation of a particular jar. As the limiting property and the relational property that is limited by it are coextensive, wherever the limiting property is present the limited property also is present and vice versa. So also in other cases of the limitor—limitor of probans-ness or probandumness, or qualificandum-ness, qualifier-ness, and so on.

Using limitors to indicate the quantity of a cognized structure (according to Western logic, the proposition) differentiates the Indian logic of quantification from Western logic in a fundamental way. In Aristotelian logic, as also in modern symbolic logic, propositions or sentences are classified into four different *forms*—A, E, I, O—by quantity and quality. Universal propositions in Western logic are those which are quantified by the use of words like 'all', 'every', 'any', 'no', and so on. The quality, especially negative quality, is indicated by using words like 'no', 'not', or 'never', and so on. Now according to Navya-Nyāya, anything indicated by words occurring in a sentence will enter into its *content* and cannot belong *to* its *form.* That is why, according to Navya-Nyāya, the so-called quality of a proposition or a sentence which has to be indicated by the presence or absence of a negative particle cannot be a matter of form. So also if quantity in sentences is indicated by using words like 'all', 'some', and so on, then quantity will also be included in the content of the meaning of the sentences but cannot belong to their form. Accordingly, Navya-Nyāya, which deals with cognitions, rather than with propositions or sentences, sees a fundamental difference between the quantity and the quality of the content cognized. The quantity, like universality, particularity, cannot be expressed by any word occurring in a sentence which expresses the cognition, or rather the object of the cognition. Words occurring in such sentences refer to objects and are cognized as referents. But according to Navya-Nyāya, a word can refer to an object only if the object is presented under a specific mode, which must be a property belonging to the object and is the reason for the application of the word to the object. This mode of presentation, although meant by the word, is never its referent; it is the qualifier of the qualificative cognition which one has on hearing a word. The referent is the

qualificandum of the qualificative cognition resulting from hearing the word, and the mode of presentation of the referent of the word is the qualifier. This mode, under which falls the referent of a word, is called the limitor of being referent of the word. Now this limitor is coextensive with the property of being referred to by the word. Whatever is referred to by the word has this property, and whatever has this property is a referent of the word. Thus, the concept of limiting property in the sense of a coextensive property of what is limited reveals or manifests the quantity of the structure cognized.

It is to be noted here that a limiting property or relation in this sense is not to be identified with what gets manifested in cognition. This is because even a property which is not a mode of a cognition can become a limitor in that cognition. A heavier property, even though it is manifested as a mode, cannot be a limitor if there is a lighter property coextensive with it. When a person hears a sentence uttered by a speaker, he, unlike the speaker himself, is not certain about the limitor. It is for this reason, that is, to avoid the uncertainty and vagueness in ordinary language where adjective of quantity is not used, that Navya-Nyāya has developed a technical language using 'limiting property', 'limiting relation', 'determiner', 'determined', and so on to make explicit that which was not explicit in the sentence. Thus, Navya-Nyāya language is not a metalanguage in the sense of being a language about another language, the object language. The technical language is a device to state explicitly what has been left unsaid in the ordinary sentence.

In Western logic, a universal sentence is analyzed into a propositional function containing at least one free variable, which becomes bound by the quantifier. The quantifier in such logics performs three different functions: binding, abstracting, and quantifying. The operation of binding a variable is merely to delete or cancel it from the expression. Thus we have the equivalence:

$$(\lambda x)Fx = F.$$

The binding of a variable thus results in abstraction in the sense that the propositional function yields a property. The third function, namely, that of

quantifying a propositional function, is really to say something about the property. A universal quantifier says that the property is universal; an existential quantifier says that the property is satisfiable. Thus combinatory logic, which uses functions as arguments of functions, dispenses with the use of variables. Quantification, therefore, involves a higher level of thought.

In Navya-Nyāya, quantification is a matter of a way of cognizing objects. To cognize the object in one way, that is, where the limiting property is general, is to cognize the object universally. When the limiting property is a special property, the cognized structure is particular. We shall first explain here the meaning of 'all' and 'a' in Navya-Nyāya, and then show why universality and particularity cannot be indicated by these words.

Meaning of 'All'

'All' may be used as an adjective of the subject expression or of the predicate expression, which must be a count noun. "All objects are knowable," and "Time has all properties" are the examples of the respective cases.

The first case.

The referent of 'all' is that which is without remainder. But this requires explanation of 'being without remainder'. The subject is cognized as having the predicate totally in such a case. This simply means that everything which is cognized under the mode of the subject term possesses the property referred to by the predicate term. (The predicate has to be distinguished from the predicate expression. The normal form of an expression of a cognition in Navya-Nyāya is *a* as *b*-possessing. The predicate expression is '*b*-possessing', but the predicate is *b*, not '*b*'. Thus the sentence 'Socrates is wise' has to be transformed into 'Socrates as wisdom-possessing' where the predicate expression is 'wisdom-possessing' but the predicate is wisdom.)

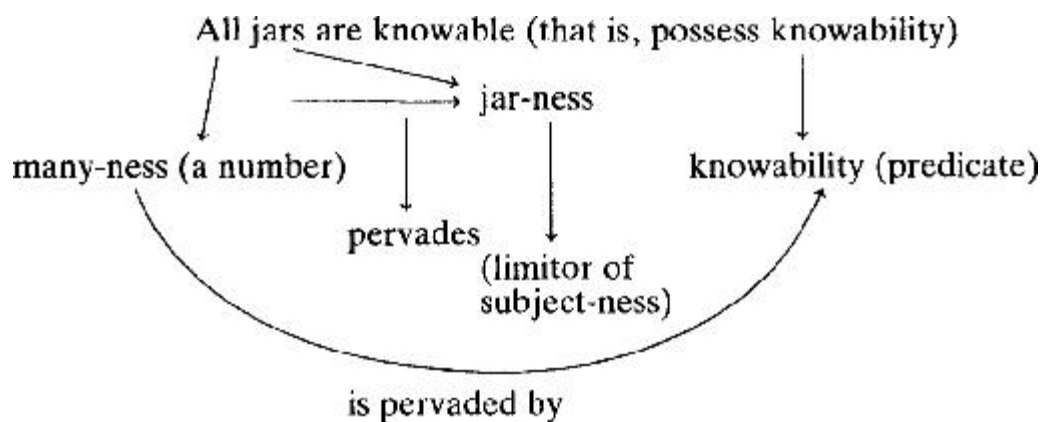
Gadādhara explains the meaning of 'all' as an adjective of the subject (the referent of a count noun) in the following way. According to him the referent of 'all' as an adjective of the subject is whatever is cognized under the mode of many-ness (a number), which pervades the mode of presentation of the referents of the subject term and is pervaded by the predicate. In the sentence 'all substances are knowable', the subject is substances and the mode of their presentation by the word 'substance' is substancehood. This means that all substances are the referents of the term 'substance' merely *as substances*, that is, as instances of the universal substancehood. The word 'all' here means whatever possesses such a number which pervades substancehood, which is the mode of presentation of the referents of the subject term. Substancehood is present in all individual substances; therefore the number or plurality may be present in more objects, that is, other than substances, but it must be present at least in all substances in order that the plurality be the pervader of substancehood. Now this plurality, which is a number, has to be pervaded by knowability, which is the predicate in the sentence. This means that every locus of this plurality must also be a locus of knowability. Thus, the sentence 'all substances are knowable' means that wherever there is substancehood there is knowability. (Gadādhara's interpretation of 'all' as an adjective of the subject term in terms of the relation of pervasion between three properties amounts really to transforming a universal sentence into a conditional one. This is because of the Nyāya interpretation of pervasion as a relation which is not a *necessary* relation. To say that *a* pervades *b* is to say that whatever possesses *b*-ness possesses *a*-ness, not that whatever possesses *b*-ness *must* possess a-ness).

To say that all substances are knowable is not to say that there are no objects other than substances which do not have knowability. The use of 'all' does not preclude the possibility of the predicate belonging to things other than the referents of the subject term. What is precluded is that the predicate may not belong to all the referents of the subject term. This possibility is precluded by the stipulation that the plurality which is the mode of presentation of the referents of 'all' must be pervaded by the predicate.

If the condition, that the plurality or many-ness which is the mode of presentation of the referent of 'all', is not pervaded by the predicate, then the predicate will not be present in all objects which are the subject of the sentence. For example, we cannot say correctly that all jars are blue, for the plurality which qualifies jars is not pervaded by the color blue; wherever jarness is present, the plurality is present, but wherever this plurality is present, blue color is not present. So we can only say that some jars are blue.

If the condition, that the many-ness which is the mode of presentation of referents of 'all' be the pervader of the mode of presentation of the subject, is not given, then, too, the use of 'all' will be unjustified. In the sentence 'all jars possess blue color', the blue color is the predicate; if the many-ness is pervaded by this predicate, then wherever this many-ness is present, blue color will be present, and all and only blue jars will be the loci of this many-ness. But this cannot be the meaning of 'all jars are blue'. Hence the further condition, that the many-ness which is the mode of presentation of the referents of 'all' has to pervade the mode of presentation of the subject, is necessary.

We may represent this interpretation of 'all' in [diagram 3](#).

Diagram 3


This means that wherever jar-ness is located the number is located, and wherever the number is located knowability is located.

It should be noted here that the referent of 'all' being defined in terms of pervasion, pervasion itself cannot be explained in terms of 'all'. In Western logic, where the universal or the existential quantifier is regarded as basic,

pervasion can be defined in terms of the universal quantifier thus:Definition of pervasion:

$$s \text{ pervades } h = (x)(xR_1h \supset xR_2s).$$

But according to Navya-Nyāya philosophers, it is in terms of the relation of pervasion by which the meaning of 'all' is to be defined.

The second case.

In the case of 'all' being an adjective of the predicate expression, its referents will be whatever has plurality (many-ness), pervading the mode of the predicate and being pervaded by the relevant relation to the subject. In the sentence 'time possesses all properties', the predicate is *property*, and its mode is *being a property.* A property is something that *is in* another object. Being such a property is pervaded by the plurality belonging to all properties. This plurality is also present in all properties in which the mode of the predicate (being a property) is present; so the plurality pervades the mode of the predicate. Again, all properties are in time and hence are related to time. So all individual properties are such that the plurality (of all properties) is present in them, and *being a* property is also present in them, and *being related to time* is also present in them. Hence all the conditions of determining the referent of 'all' are satisfied in this case. Diagram 4 will make the meaning clear.

Diagram 4
Wherever property-ness is located (that is, whatever is a property) the number is located. Whatever the number is located in is *in time* (that is, is

related to the substance which is time by the temporal relation). From this it follows that whatever is a property is in time. According to Gadādhara, this is the meaning of 'Time has all properties'.

Meaning of 'One'

If it is said that the meaning of 'one' is whatever possesses one-ness, then it will be quite proper to say that one man is present in the room when there are many others in the room. For each individual person will be one person, but according to Navya-Nyāya, this will be a false statement in this circumstance. In Sanskrit idiom, 'one' means 'one and only one'. The meaning of 'one' in this sense is explained by Gadādhara in the following way. If 'one' is an adjective of the subject expression, then it refers to whatever possesses one-ness, which is not the counterpositive of difference present in the referent of the subject expression, which is qualified by the predicate. If there are two persons, A and B, in the room, then A has one-ness, but A as well as B is qualified by the predicate (being in the room), and A is different from B; the one-ness of A *is the counterpositive of* difference from B, who is also a referent of the subject expression "B" and is in the room. So we cannot say about A that one man is in the room.

So also in the case of 'one' as an adjective of the predicate expression. 'One' in such a sentence will refer to whatever has one-ness, which is not a counterpositive of difference present in the predicate, which is related to whatever has the predicate as its property. In the case of two-eyed persons, we cannot say that they have one eye, for the one-ness as qualifying the predicate, eyes, say, A and B, cannot be said to belong to A, or to B, alone. For such a one-ness in A is counterpositive of difference from B, which is the other eye, related to (belonging to) such persons.

It becomes clear now why Navya-Nyāya cannot use 'all' to indicate quantity of cognitions. For to understand the meaning of all, it is necessary to use the cognition of pervasion, which, therefore, cannot be indicated by 'all'. But the concept *pervasion* itself involves universality, so universality

has to be understood independently of the use of 'all'. This, as has been explained above, is done by using the concept of limitor in the second sense.

V. USE OF LIMITORS IN THE NAVYA-NYĀYA DEFINITION OF PERVASION

Navya-Nyāya uses limiting properties and limiting relations almost constantly, especially in definitions. Limitors are mainly used for two purposes, both of which are connected with the notion of a mode of presentation of an object in a cognition. One such use is to explain why objects which are ontologically identical cannot be used interchangeably in a cognitive context like an inference. The other use is to determine the quantity, universality, or otherwise of the objects of cognition by their mode of presentation in cognition. I shall now explain these two uses of limitors by examining a definition of pervasion as given in Viśvanātha.[13]

Pervasion is such a relation between the pervader and the pervaded that the pervaded becomes an unfailing mark of the pervader. This is possible if and only if the pervaded (h) does not occur where the pervader (s) does not occur. This may be analyzed differently in terms of different types of negation admitted in Navya-Nyāya. The definition of pervasion that we shall discuss here is in terms of absence and difference. Initially it may be stated thus:

(1)

Pervasion of h by s = the absence of h from what is different from a locus of s (the mark (h) must not occur where s does not occur).

This initial statement is then further analyzed as

(2)

Pervasion of h by s = negation of occurrence of h determined by what possesses difference the counterpositive of which is a locus of s.

That this definition is correct is shown by applying it to an example. Smoke is pervaded by fire, invariably goes with fire, and is, therefore, an unfailing mark of fire. Now smoke does not occur where fire does not occur. The locus where fire does not occur is necessarily different from the locus where fire occurs.

S If x is different from y, then x has difference from y.

This is stated in Navya-Nyāya terminology as:

SN x has difference the counterpositive of which is y.

This is because of the definition:

DD1 x is different from y − y is counterpositive of difference resident in x; or,
x has difference the counterpositive of which is y.

This definition of pervasion seems to be correct as it does not apply to the case which is not a case of pervasion. If someone infers that there is smoke, because there is fire, the smoke (s) becomes the pervader, and fire the pervaded (h). This is not a case of pervasion, for there is at least one instance where fire is present but smoke is not (say, a red-hot iron ball). The definition of pervasion, too, is not applicable to this wrong case.

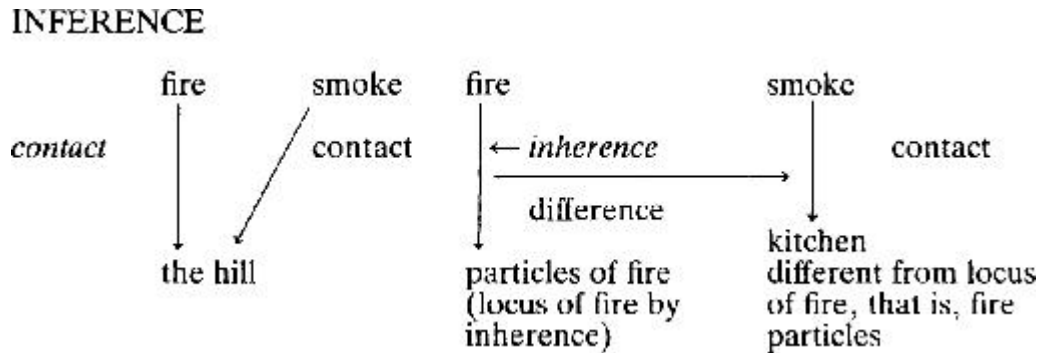
But the definition as it stands is not adequate. The first insertion here is that in understanding a locus of s in 'different from a locus of s' in (1), we have to take that relation which is the limiting relation of *s-ness* in the inference. Why this is necessary is explained as follows.

Smoke is really pervaded by fire; hence the definition of pervasion ought to apply to this case. But if the relation in which locus *of s* is to be taken is not specified, then the definition will fail to apply to this case and will be too narrow. Without this identification of the limiting relation of s-ness with the relation in which s is to be located in the locus, by 'locus of fire' we may understand its particles, for fire is located in its particles by inherence. The kitchen, for example, becomes different from this locus of s, but smoke is present there. Hence the definition of pervasion does not apply here.

The defect is remedied by the said identification of the two relations. When one infers fire on a hill, one infers that fire occurs on the hill in the

relation of contact, not inherence. Hence, when one understands 'locus of fire', one must understand an object where fire occurs by the relation of contact. This may be explained by <u>diagram 5</u>.

Diagram 5

INFERENCE


The difficulty is therefore resolved by stipulating that the relation of fire to its locus must be identical in both the cases. Since in <u>diagram 5</u> the two relations are not the same, this case does not show that the definition of pervasion is too narrow.

The next insertion is of a limiting property having the function of a universal quantifier. The h must not be present where s is not present. This means that h must not be present in *any* locus where s is absent. This again means that the h must not be present in a locus which is different from each and every locus of s. This point may be explained by <u>diagram 6</u>.

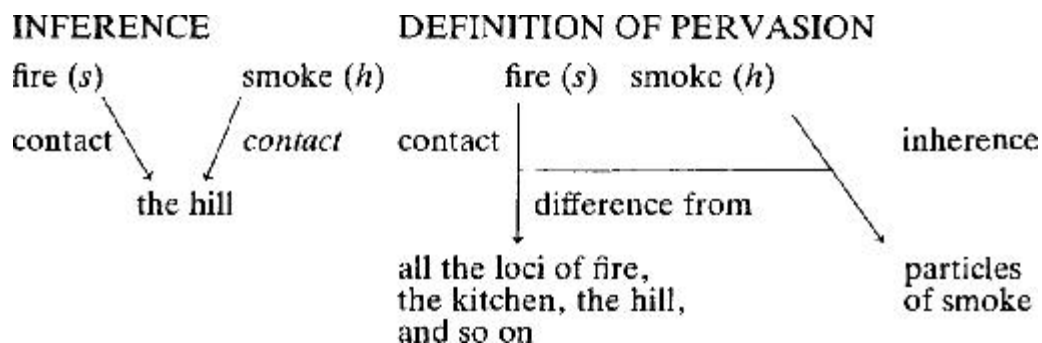
Diagram 6
This means, in the Navya-Nyāya terminology, that the counterpositive of difference must be *all loci* of s. This is achieved in Navya-Nyāya terminology by saying that the counterpositive-ness resident in the counterpositive must be limited by mere locus-ness of s; that is, the counterpositive of difference has to be cognized under the mode of *being just a locus of s*. The necessity of

this insertion is proved negatively by showing what would follow if it is not made (diagram 7).

Diagram 7

Diagram 7
Understanding by 'difference from a locus of *s*' the difference from a particular locus, say, the hill, we can take the kitchen as different from this particular locus of fire, where smoke is present. Thus the definition of pervasion without this insertion will fail to apply to the smoke-fire case, and will be too narrow. This insertion makes explicit what will count as different from a locus of *s*, what will be the counterpositive of the difference from a locus of *s*.

A third insertion is necessary to explain the sense in which the *h* must be present in a locus of absence of *s*. It is pointed out that the limiting relation of *h* in the inference must be the same as the limiting relation of counterpositiveness resident in *h*. This may be explained by diagram 8.

Diagram 8


In the inference in diagram 8, smoke on the hill has become the mark (*h*) of fire (*s*) by being in contact with the hill. But the attempt to show that the definition of pervasion is too narrow is based on taking a different relation,

in which smoke is present in its particles, which are different from every locus of fire by contact. So all other conditions have been satisfied, but this new condition in which smoke is to be taken as being absent has not. Hence this attempt to show that the definition is too narrow does not succeed.

The final insertion in the definition shows that substitutivity of ontological identity does not hold in inference. The example given by Viśvanātha is based on the Navya-Nyāya theory of the ontological identity between a qualified object and the object as unqualified. Thus existence is a universal which inheres in the first three categories, namely, substance, quality, and motion. Yet existence *as* excluded from quality and motion inheres only in substance. In Navya-Nyāya terminology, existence qualified by exclusion from quality and motion inheres only in substance, but because existence so qualified and existence pure and simple are ontologically identical, a valid inference would become invalid if this identity is allowed. The inference is this:

> *Inference:* This is a substance, for it possesses existence qualified by exclusion from quality and motion.

This valid inference will become invalid if, in place of qualified existence, we write existence pure and simple. To prevent this sort of substitution, Viśvanātha points out that ontological identity is not sufficient; what is necessary is to consider the mode under which the *h* is cognized. This may be explained by [diagram 9](), and the inference reconstructed in [diagram 10]().

Diagram 9

INFERENCE   being qualified (qualifier-ness) cognitive mode of *h*

substance-ness (*s*)   qualified existence (*h*)

inherence   inherence

a jar
Diagram 10

RECONSTRUCTED INFERENCE

substance-ness (*s*)   qualified existence = existence

inherence |———————————————→| inherence
          | difference from |
all loci of *s*   qualities
(all substances)
In diagram 10 all the previous conditions have been fulfilled: (a) locus of *s* in the same relation as in the inference; (b) difference from every such locus of *s*; and (c) the relation in which *h* functions in the inference, which is the same relation, namely, inherence. Yet the *h*, qualified existence being ontologically identical with pure existence, inheres in what is different from every locus of *s*. Viśvanātha's suggested solution is that ontological identity is not sufficient to justify the substitution; the mode of cognition also has to be taken into consideration. In the present case, although qualified existence and pure existence are ontologically identical, they are cognized under different modes, in the inference as qualified, and in the substitution as pure, existence. Hence for substitution in any inference, what is necessary is the identity of modes of cognition, not ontological identity.

The Nyāya on Double Negation

J. L. Shaw

The aim of this paper is to discuss the Nyāya theory of double negation in the light of the four types of negation mentioned in the classical theory of the Nyāya system. Since the Nyāya has discussed negation at the linguistic, epistemic, and ontological levels, the proper understanding of the Nyāya view would presuppose the Nyāya conception of cognition, relation, and meaning. Moreover, the Nyāya concept of negation is not identical with either the term-negation or the proposition-negation discussed in contemporary philosophy. The first section of this paper will deal with some of the basic concepts of the Nyāya, and the second section will deal with the sixteen types of double negation.

1

It is claimed by contemporary logicians that what is negated is a proposition or a proposition-like expression. Arthur Prior in his article on negation said:

> By the use of open sentences all the varieties of negation are reduced to the placing of "not" or "it is not the case that" before some proposition or proposition-like expression, the whole being either contained or not contained within some wider propositional context. This reduction assumes that with the basic singular form "x is an A" or "x ϕ's" there is no real distinction between the internal negation "x is not an A" (or "x is non-A") or "x does not ϕ" and the external negation "Not (x is an A)" or "Not (x ϕ's)".

From the above remarks it follows that all types of negation are reducible to the negation of a proposition or a propositional function. The distinction between an external and an internal negation is relevant in the context of a complex proposition. The negation of 'If p, then q' is not 'If p, then not-q', but 'Not (If p, then q)'. Similarly, if we apply Russell's theory of definite description, then in contexts like 'The present King of France is bald', the negation (i.e., the external negation) is not 'The present King of France is not bald', but 'It is not the case that the present King of France is bald'. But this distinction between an external and an internal negation does not suggest that the negation has been applied to different types of entities. The negation is applied to either a proposition or a proposition-like expression as Arthur Prior suggested. In this respect the Nyāya concept of negation is different from the contemporary concept of negation.

According to the Nyāya what is negated is the second term of a dyadic relation *as the second member of this relation*. The explanation of this concept would lead us to the Nyāya concept of cognition and relation.

The Nyāya has drawn a distinction between a qualificative cognition and a nonqualificative cognition.[1] A qualificative cognition can be expressed by a complex expression of the form 'aRb', where 'a' stands for the qualificand, 'b' for the qualifier, and 'R' for the qualification relation. Hence a qualificative cognition necessarily involves at least three elements at the epistemic level.[2] In a qualificative cognition an object is cognized under some mode of presentation, but in a nonqualificative cognition the ultimate elements of a qualificative cognition are cognized without any mode of presentation.

Let us consider the cognition of a table expressed by the expression 'a table'. In this cognition a particular table is the qualificand, the universal tableness is the qualifier, and the relation of tableness to a particular table is the qualification relation, which in this context is inherence. Since a table is the qualificand, it has the property of being the qualificand. This property of being the qualificand simply specifies the role of this object at the epistemic

level. Similarly, the universal tableness which is the qualifier has the property of being the qualifier. The relation of inherence is neither a part of the qualificand, nor is it a part of the qualifier. It is a mode of presentation of the qualifier. That is to say, the universal tableness is cognized as the second member of the relation of inherence. In the technical language of the Nyāya it is described as "the limiting relation of the property of being the qualifier". In a more complex cognition expressed by the expression, say, 'a table is brown' or 'a brown table', the qualificand is a table and the qualifier is a particular brown color. The property of being the qualificand residing in a table which is the qualificand is limited by the universal tableness, and the property of being the qualifier residing in a brown color which is the qualifier is limited by the universal brownness. The relation of inherence which relates a brown color to a table is also a mode of presentation of the brown color. Hence this relation becomes the limiting relation of the property of being the qualifier. The property of being the qualificand is limited by a property alone, while the property of being the qualifier is limited by both a property and a relation.

This feature of the Nyāya can be compared to some extent with Frege's distinction between saturated and unsaturated parts of a thought. Frege claimed ([3], p. 54), "... not all parts of a thought can be complete; at least one must be 'unsaturated', or predicative; otherwise they would not hold together". The Nyāya also considers the qualifier as unsaturated in the sense that the relation is also a mode of presentation of the qualifier. Moreover, the Nyāya has given specific reasons for the inclusion of a relation within the mode of presentation of the qualifier.[3] However, from this comparison I do not intend to conclude that the Nyāya use of the term 'qualifier' is the same as Frege's use of the term 'concept'. What I am emphasizing is the unsaturatedness of a qualifier in the sense that it necessarily depends upon a relation.

From the above discussion it follows that any qualificative cognition can be described by the form 'aRb', where 'a' stands for the qualificand, 'b' for the qualifier, and 'R' for the qualification relation. When this description is

expanded in the technical language of the Nyāya, it takes the following form:

The cognition in which the property of being the qualificand residing in *a* is limited by *a*-ness and determined by the property of being the qualifier residing in *b*, which is limited by both *b*-ness and *R*.[4]

The distinction between the relation *limited by* and the relation *determined by* can be explained in the following way:

(A) *x* is limited by *y* iff

(i) both *x* and *y* are properties,
(ii) *x* is a relational property, and
(iii) the property *y* is a mode of presentation of the object where relation property *x* resides.

In this context it is to be noted that the expression 'mode of presentation' is used in such a way that it determines the referent(s) of a term. Moreover, the Nyāya use of the term 'property' is much broader than the ordinary use of it. A property, according to the Nyāya, has been defined in the following way:

x is a property iff (∃*y*) (*y* is a locus of *x*)

(B) *x* is determined by *y* iff both *x* and *y* are relational properties of correlatives.

In this context it is to be noted that the *determined by* relation is symmetrical. That is to say, if *x* is determined by *y*, then *y* is also determined by *x*. But the *limited by* relation is not symmetrical.

Now let us discuss the Nyāya conception of relation and the classification of relations which is the basis for drawing a distinction between the two types of negation. According to the Nyāya *R* is a relation if the following conditions are satisfied:

(i) It is due to R that x appears as the qualificand and y appears as the qualifier of a cognition which is expressed by 'xRy'.

(ii) It is due to R that the referents of 'x' and 'y' are unified in such a way that 'xRy' represents a fact in the world.

The former feature of a relation is epistemic and the latter one is ontological. At the level of fact, x is called 'the first term' ('*anuyogin*') and y is called 'the second term' ('*pratiyogin*') of R. At the epistemic level x is the qualificand and y is the qualifier of R.

According to the Nyāya all relations are dyadic, and all higher-order relations are reduced to a set of dyadic relations. All relations can be divided into two types depending upon whether the second term occurs in the first term or not. The relation in which the second term occurs in the first term is called 'occurrence-exacting relation'. The linguistic form 'y is in x' or 'y occurs in x' represents this type of relation. If the second term does not occur in the first term, then the relation is called 'not occurrence-exacting'. Relations like conjunction and inherence are occurrence-exacting.[5] But relations like identity, pervasion, the property of being the content, the converse of the property of being the content are not occurrence-exacting. In this context another important aspect of the Nyāya concept of relation should be mentioned. In some context a term itself plays the role of a relation. This type of relation is a self-linking relation (*svarūpa-sambandha*). Relations like the relation of the property of being Socrates to its possessor, relation of the property of being the present President of the United States to its possessor are self-linking relations. Most of the relational abstracts, such as the property of being the substratum, are considered as self-linking relations. In addition to these types of self-linking relations there are spatial and temporal self-linking relations. The self-linking relation plays an important role in the context of a negation. When we say 'x has the absence of y', what we mean or understand is that the absence of y, which is a negative entity, is related to its locus x by an absential self-linking relation which is a special type of self-linking relation. That is to say, the relation of the absence of y to x is not a separate ontological entity. It is to be identified

with at least one of the terms of a relation. According to most of the Nyāya philosophers it is to be identified with the first term of a relation (*anuyogin*).

Now let us formulate the criteria for forming a significant negative expression. If the following conditions are satisfied, expressions of the form 'not-*t*', or 'absence of *t*', or 'non-*t*' would be considered significant:

(i) If '*t*' is a meaningful expression or refers to an entity, then 'not-*t*' would be significant provided '*t*' does not refer to an absolutely universal property such that nothing lacks this property. According to the Nyāya properties like *nameability, knowability*, and *existence*, are considered universal properties in this sense.[6] Hence, expressions like 'nonexistence', 'nonnameability' and 'nonknowability' are not considered significant negative expressions.

(ii) If 'not-*t*' is significant, then '*t*' is not an empty term. Since terms like 'a hare's horn', 'Pegasus', and 'unicorn' are considered as empty, their negations would not be significant negative expressions. From this condition one should not conclude that any expression which contains an empty term is nonsignificant.[7] Instead of the sentence 'A hare's horn does not exist', the Nyāya prefers the sentence, 'There is an absence of a horn in a hare'.

(iii) The expression 'not-*t*' or 'negation of *t*' will be meaningful if we know what it is for *t* to be present somewhere. If we know what it is for *t* to be present somewhere, then we know the manner of presentation of *t*. Since *t* is the counterpositive (negatum) of the negation of *t*, *t* has the property of being the counterpositive. This property simply specifies the role of *t* in the context of a negation. The manner of presentation of *t* in the cognition negation of *t* is the limitor of the property of being the counterpositive residing in *t*. If the manner of presentation of *t* is a property, then the limitor is called a 'property-limitor', and if the manner of presentation is a relation in which *t* is cognized, then the relation is called a 'relation-limitor'. The relation in

which *t* is present somewhere is called 'The limiting relation of the property of being the counterpositive residing in *t*'. The property of being the counterpositive is limited by a property (simple or complex) and a relation (simple or complex).[8]

At the epistemic level the cognition of not-*t* presupposes or depends upon the cognition of *t*. If a person has not cognized *t*, then he cannot cognize not-*t*. The cognition of *t* such that *t* is presented under some mode of presentation is considered as one of the causal conditions for the cognition of not-*t*. But the relation between the cognition of not-*t* in the locus *l* and the cognition of *t* in the same locus *l* is preventer-prevented, which is the analogue of the contradictory relation between two contradictory propositions.

When we discuss the validity and the invalidity of a cognition, or the truth and falsity of a proposition which expresses a cognition, we move from the epistemic level to the ontological level. If a cognition is valid, then all the elements of it are real, and the relation relates the second term with the first term. In the case of the valid cognition of *aRb*, the cognition as a mental entity is related to *a*, *b*, *R*, and the complex *aRb*. But in the case of an invalid cognition, the cognition is related to *a*, *b*, and *R*, but not to the complex *aRb*. Hence the content of an invalid cognition does not have the property of being the content of qualificand-qualifier complex (*viśiṣṭā-viṣayatā*), and the cognition does not have the converse of this relation. In other words, in a valid cognition the relation not only makes one of the terms a qualifier of another term which is the qualificand, but also relates the former to the latter at the level of fact. Since the second function of a relation is absent in an invalid cognition, it is said that the qualification relation is unreal. In this context it is to be noted that my use of the term 'unreal' in this context does not mean 'nonentity'. The qualification relation is an entity, but in the case of an invalid cognition it does not perform the second function of a relation. However, some Nyāya philosophers, for example, Vācaspati Miśra, have claimed this relation to be a nonentity (*asat;* cf. [13], p. 271). Now the question of the validity or invalidity of a cognition introduces the problem

whether the negation of t (i.e., not-t) or t is present in a locus. According to the Nyāya if t occurs pervasively in its locus, then the negation of t cannot be present in the same locus, and conversely. But both t and the negation of t are real entities in the world. Hence the expressions 't' and 'not-t' are nonempty terms. If t does not occur pervasively in its locus, then the negation of t is also present in the same locus, and conversely. But this does not lead to a contradiction because t and not-t do not characterize the same portion of the locus at the same time. Here also both 't' and 'not-t' are nonempty terms.

Above we discussed the problem of negation at three different levels and how these levels are related to one another; now let us introduce the Nyāya classification of different types of negation.

Broadly speaking, there are two types of negation, viz., relational absence, and mutual absence or difference. The distinction between them can be drawn in terms of the limiting relation of the property of being the counterpositive which resides in the negatum. At the linguistic level these negations can be represented by the following forms:

(1) x is not in y or x does not occur in y, or not-x is in y.
(2) x is not y, or x is different from y.

(1) represents relational absence and (2) represents mutual absence. In (1) not-x occurs in the locus y, and x is the counterpositive of not-x. The property of being the counterpositive residing in x (i.e., the role of x) is limited by both x-ness and an occurrence-exacting relation. In other words, both x-ness and an occurrence-exacting relation are modes of presentation of x. Here x-ness is the property-limitor and an occurrence-exacting relation is the relation-limitor. In (2) y is the counterpositive, i.e. the negatum, and the property of being the counterpositive residing in y is limited by both y-ness and the relation of identity. So the relation of identity is the limiting relation of the property of being the counter-positive.

Most of the Nyāya philosophers have accepted three types of relational absence:

(1) The relational absence of an object before its production is the not-yet type of absence *(Prāgabhāva)*. The absence of a jar before its production is present in its parts.[9] The cognition of this absence can be expressed by the sentence 'A jar will be produced in these parts'. When the jar is produced, the not-yet type of absence does not exist in its part. Since it cannot exist anywhere else, it ceases to exist. This type of absence has no beginning, but has an end. Since we are not asserting the absence of all jars, but the absence of the jar which will be produced, the property of being the counterpositive is limited not by a generic property like jarness, but by a specific property like a particular blue color *and* jarness.[10] As regards the limiting relation of the property of being the counterpositive, there is some difference of opinion among the Nyāya philosophers. It is claimed that since the jar has not yet been produced, the property of being the counterpositive is not limited by any relation. But the old Nyāya has accepted a temporal relation as the limiting relation of the property of being the counter-positive. If the absence of the jar is in its parts at t_n and the jar is produced in the parts at t_{n+1}, then obviously the jar is related to its parts by the relation of posterior existence. This temporal relation of posterior existence is considered as the limiting relation of the property of being the counterpositive. But the followers of the Navya-Nyāya do not subscribe to this view.

(2) The relational absence of an object after its destruction is the no-more type of absence (*dhvaṃsa*). The absence of a particular jar when it is destroyed is present in its parts. Since the destruction of a particular jar does not imply the destruction of all jars, the property of being the counterpositive is limited, not by a generic property, but by a specific property of the jar which has been destroyed. As regards the limiting relation, here also there is difference of opinion among the Nyāya philosophers. The followers of the Navya-Nyāya do not accept any limiting relation, while the followers of the old Nyāya have accepted a

temporal relation as the limiting relation. If the destruction of a particular jar is the separation of its parts, then the whole jar ceases to exist at time, say, t_n, when it is destroyed. If 'ceases to exist at time t_n' is explained as 'existent at time t_{n-1}', then the parts are related to the jar by the relation of previous existence.[11] For this reason it is claimed that the property of being the counterpositive is limited by the temporal relation of previous existence. Apart from this temporal relation the property of being the counterpositive is not limited by any other relation. A no-more type of absence has a beginning, but no end.

(3) The third type of relational absence is the never type of absence (*atyantābhāva*), for example, the absence of color in air, or the absence of a jar on the ground. Some of the followers of the old Nyāya do not consider the absence of a jar on the ground as a case of never type of absence. Since a never type of absence has neither a beginning nor an end, and since the absence of a jar on the ground has both a beginning and an end, these philosophers think that there is a need to accept a fourth type of relational absence. But the followers of the Navya-Nyāya as well as some of the followers of the old Nyāya think that the acceptance of the fourth type of relational absence would lead to the postulation of innumerable absences of a jar on the same ground. Each time the jar is removed, a new absence is created, and each time the jar is brought back, the previous absence is destroyed. In order to avoid this consequence, it is claimed that what ceases to exist when the jar is brought back is not the absence of it, but the relation of this absence to the ground. An absence is related to its locus by a self-linking relation which is to be identified ontologically with its locus. Now the followers of the Navya-Nyāya are of the opinion that this self-linking relation in the case of the absence of a jar on the ground is to be identified not with the ground as such, but with the ground when a jar is not present. Since this self-linking relation ceases to exist when a jar is brought on the

ground which had an absence of a jar, we cannot perceive this absence when a jar is present on the same ground. So on the ground of parsimony these philosophers have included such examples under the third type of relational absence.

The property of being the counterpositive of a never type of absence is limited by both a property-limitor and a relation-limitor. But the limiting relation is an occurrence-exacting one.[12]

2

Now let us discuss whether the law of double negation holds good for the Nyāya philosophy. Since there are four types of negation according to the classical view of the Nyāya, there would be sixteen types of double negation. The aim of this paper is to discuss: (i) whether each of the sixteen double negations is identical with something or not, (ii) if it is identical with something, whether it is a positive or a negative entity, and (iii) if it is identical with a positive entity, whether it is the same as the negatum of the first negation. Let us use the symbol '~' for a never type of absence, the symbol '¬' for a not-yet type of absence, the symbol '⌐' for a no-more type of absence, and the symbol '−' for a mutual absence.

(1) ~~ x.

It is claimed by Gaṅgeśa and many other Nyāya philosophers that a never type of absence of a never type of absence of x is identical with x. The arguments in favor of this view are mainly epistemological. It is claimed that whenever we perceive the presence of an object, say a pot, we do not perceive the absence of it in the same locus and vice versa. The perceptual cognition of one will be prevented by the perceptual cognition of the other. Hence a never type of absence of a never type of absence of x is identical with x, i.e., with the counterpositive.

Raghunātha, a follower of the Navya-Nyāya school, does not subscribe to this view. He claimed that as we accept a negative entity in order to

establish the truth of the proposition 'There is an absence of a pot on the ground', so we accept a negative entity in order to establish the truth of the proposition 'There is an absence of an absence of a pot on the ground'. Moreover, he claimed that all absences have something in common and this common property distinguishes absences from all other positive entities. The property of being an absence (*abhāvatva*), which is a common character of all absences, is an unanalyzable imposed property and it is to be distinguished from other class-characters such as horseness or cowness. In this context it is to be noted that any property other than a class-character (*jāti*) such as horseness is called 'an imposed property' ('*upādhi*'). Hence, a never type of absence of a never type of absence of *x* is not identical with *x*. Now the question is whether a third or a fourth never type of absence is also a separate absence or not. On this point Raghunātha claimed that a third never type of absence is identical with the first never type of absence and the fourth never type of absence is identical with the second never type of absence. So the law of double negation is valid in the following cases:

(a) ~ ~ ~ *x* = ~*x*
(b) ~ ~ ~ ~*x* = ~~*x*.

The general rule may be stated in the following way:

If *n* never types of absence precede *x*, then ~*x* is identical with it provided *n* is an odd number of never types of absence; and if *n* is an even number of never types of absence, then it is identical with ~~*x*.

Pakṣadhara Miśra, a follower of the Nyāya school, considers a never type of absence of a never type of absence of *x* as identical with the limiting relation of the property of being the counterpositive.

Let us consider the proposition 'There is a pot on the ground by the relation of conjunction'. If this proposition is true, then there is a pot on the ground by the relation of conjunction. The never type of absence of a never type of absence of this pot by the relation of conjunction is identical with the conjunction relation which is a particular quality of both the pot and the

ground according to the ontology of the Nyāya school. But Raghunātha has raised an objection against this view on the ground that if an absence of an absence of a pot by the relation of conjunction is identical with the conjunction relation, then the cognition of an absence of a pot and the cognition of an absence of an absence of a pot cannot be related by preventer-prevented relation. If we accept the view of Pakṣadhara Miśra, then the cognition of an absence of an absence of a pot being identical with the cognition of conjunction relation cannot be prevented by the cognition of an absence of a pot. Since the view of Pakṣadhara Miśra violates the law of contradiction at the epistemic level, it is to be rejected on this ground. Hence ~~x cannot be identical with any relation.

There is another view which might be considered as a mean between the first and the second view. The first one identifies ~~x with x. The second one does not identify ~~x with x; rather it considers ~~x as a separate entity. The fourth view claims that the referent of 'x' is identical with the referent of '~~x', but they are different with respect to sense or the mode of presentation. In the former case, the x is presented under the mode of x-ness, while in the latter case the same x is presented under the mode of the property of being ~~x. Let us consider the absence of a pot on the ground. The counterpositive of this absence is the pot which is presented under the mode of potness. That is to say, the property of being the counterpositive resident in a pot is limited by the property *potness.* Now the question is what would be the counterpositive of ~~~x. If ~~x is identical with x, then the counterpositive of it (~~~x) is x. If it were so, then what would be the difference between ~x and ~~~x? This view claims that the counterpositive of ~~~x is x, but it is presented under the mode of the property of being ~~x. So both 'x' and '~~x' refer to the same object but under different modes of presentation. If the limiting relation of the property of being the counterpositive residing in the counterpositive of ~x is different from the limiting relation of the property of being the counterpositive residing in the counterpositive of ~~~x, then also both 'x' and '~~x' refer to the same thing, but under the mode of different relation-limitors.

(2) ¬~x.

Now let us discuss whether a not-yet type of absence of a never type of absence of x is identical with any entity. Since the negatum of a not-yet type of absence is a future object and since a never type of absence is not a future object, but an eternal entity, this type of double negation does not represent any entity, positive or negative. Let us consider the absence of color in air by the relation of inherence. Since air has no color, this type of absence is an example of a never type of absence. A not-yet type of absence of a never type of absence of color would not represent any entity. Hence ¬~x would not be identical with anything.

(3) ⌐~x.

Similarly, a no-more type of absence of a never type of absence of x would not be identical with anything. Since the negatum of a no-more type of absence is a past object which no longer exists, and since a never type of absence cannot be destroyed, a no-more type of absence of a never type of absence cannot represent either a positive or a negative entity. Hence '⌐~x' does not represent anything.

(4) −~x.

A mutual absence of a never type of absence of x is not identical with x. Consider the never type of absence of color in air. This absence qualifies the air, or in other words, it is a property of the air. The mutual absence of the never type of absence of color is in all objects other than the never type of absence of a color. This absence qualifies the air, and the color along with many other objects except the never type of absence of color. Hence $−~x$ is never identical with x.

(5) −−x.

Now let us discuss whether a mutual absence of a mutual absence of x is identical with x. According to the old Nyāya it is not identical with x or with any other entity. Consider the proposition 'A is different form B' In this

case the property called 'difference from *B*' becomes a property of *A.* The property *difference from B* is itself different from everything else. So the property *difference from difference from B* is a property of everything other than *difference from B.* If it were so, then $--B$ is not identical with *B.* As a matter of fact $--B$ becomes a property of *B* also. The same type of argument is applicable to all higher-order mutual absences. A higher-order mutual absence cannot be identical with a lower-order mutual absence.

In order to avoid this regress of mutual absences, Raghunātha claimed that a mutual absence of a generic mutual absence should be identified with the property of being a positive entity (*bhāvatva*) and the property of being a relational absence. In this context the difference between a generic mutual absence and a specific mutual absence is to be noted. If 'α' ranges over all objects other than mutual absences, then '$-\alpha$' represents a generic mutual absence. But expressions like 'the mutual absence of a pot' or 'the mutual absence of a cloth' represent specific mutual absences. According to the Nyāya all positive entities have something in common which is called 'the property of being a positive entity' (*bhāvatva*). Similarly, all relational absences have something in common which is called 'the property of being a relational absence' ('*saṃsargābhāvatva*'). In the Nyāya ontology the objects which are different from mutual absences are of two types, viz., positive entities and relational absences. Hence, the property represented by the expression 'a mutual absence of a generic mutual absence', i.e., '$--\alpha$', is present in all positive objects and relation absences. For this reason Raghunātha identified this property with the property of being a positive entity (i.e., positivity) and the property of being a relational absence. But the mutual absence of a specific mutual absence is to be identified with the property of being positive entity, the property of being a relational absence and the property of being a mutual absence of other specific objects. Consider a universe of discourse where '*a*' represents a positive object, '*b*' represents a relational absence, but '*c*' and '*d*' represent two different mutual absences. Now the mutual absence of *c*, i.e., difference from *c*, is a property which is to be identified with the property of being *a*, the property of being *b*, and the property of being *d.* On the ground of simplicity, Raghunātha

wants to justify this thesis as opposed to the thesis that there are innumerable mutual absences.

(6) ~−x.

Now the question is whether a never type of absence of a mutual absence of x is identical with x or with something else. Some followers of the old Nyāya have identified ~−x with x. That is to say, just as a never type of absence of a never type of absence of x is identical with x, so a never type of absence of a mutual absence of x is identical with x.

Two objections have been raised against this view:

(i) If we identify ~−x with x, then we cannot apprehend x as the locus of ~−x when we say "x has a never type of absence of a mutual absence of x". Since we do apprehend x as the locus of ~−x, they cannot be identical with each other.

(ii) Secondly, this view goes against the law of parsimony in the following way. Consider a never type of absence of a mutual absence of a pot. If this absence is identical with a pot, then we have to admit innumerable never type of mutual absences of a pot as there are innumerable pots. For these reasons Gaṅgeśa and many other Nyāya philosophers have identified ~−x with x-ness. Let us explain this identification with an example. Consider the property of *difference from a pot.* This property is present in all things other than a pot, but the property of *the never type of absence of difference from a pot* is present in all pots only. According to the Nyāya, since potness occurs in all and only pot-individuals the property ~−*pot* is to be identified with potness. On the ground of simplicity also this identification can be justified.

But if we claim that a never type of absence of a never type of absence of x is identical with x, then ~−x = x-ness ceases to be a universally valid law. This can be proved in the following way (cf. [4]):

(a) $\sim\sim x = x$

(b) $\sim\sim -x = -x$ [(b) follows from (a) by the rule of substitution]

(c) The counterpositive of $\sim\sim -x$ = the counterpositive of $-x$ [(c) follows from (b)]

(d) The counterpositive of $\sim\sim -x$ = $\sim -x$, and the counterpositive of $-x$ = x [from the Nyāya view of negation]

(e) Therefore $\sim -x = x$ [from (c) and (d)]

Some Nyāya philosophers including Mathurānātha are of the opinion that $\sim -x$ has a dual nature. In some context $\sim -x$ is identical with x, and in some other context $\sim -x$ is identical with x-ness. Now if we accept this view of some Nyāya philosophers, then we cannot accept Leibniz' principle of the identity of indiscernibles as a universally valid law of identity.

On this point the view of Raghunātha seems to be superior to the views of other Nyāya philosophers. According to him, just as a never type of absence of a never type of absence of x is not identical with any positive entity, similarly a never type of absence of a mutual absence of x is not identical with any positive entity. Since all absences have something in common, a never type of absence of a mutual absence of x is a separate negative entity. A higher-order absence might be identified with a lower-order absence, but an absence cannot be identified with a positive entity. Hence, a never type of absence of difference from x cannot be identified either with x or with x-ness.

Moreover, the Nyāya conclusion that the property $\sim -x$ is identical with x-ness does not follow from the premise that $\sim -x$ and x-ness have the same locus. In some other contexts the Nyāya philosophers have not identified two properties of this type. Cowness belongs to all and only cows. The property of being an animal with a dewlap also belongs to all and only cows. But the latter has not been identified with the former. The latter is considered as an analyzable imposed property, while the former is considered as a class-character which is an unanalyzable property. If we follow the view of Raghunātha, then we can consider the property *the never type of absence of difference from a cow* as an analyzable imposed property

of all and only cows. This property is analogous to the property of being an animal with a dewlap. The latter is a positive entity, while the former is a negative entity, but both of them are complex properties.

(7) ⌐−x.

Now the question is whether anything corresponds to a no-more type of absence of a mutual absence of x. Since a mutual absence is considered as eternal, i.e. having no beginning and end, a no-more type of absence of a mutual absence is not an entity. Hence the linguistic expression 'a no-more type of absence of a mutual absence of x' is an empty-term.

(8) ¬−x.

Similarly, a not-yet type of absence of a mutual absence of x does not correspond to an entity. Since a mutual absence is eternal, there cannot be a not-yet type of absence of it.

In this context, it is to be noted that some of the Nyāya philosophers such as Śivāditya Miśra do not accept the eternality of a mutual absence. They think that a mutual absence of a pot is also destroyed when a pot is destroyed. Similarly, they would admit a not-yet type of absence of a mutual absence of a pot when a pot is not yet produced. But most of the Nyāya philosophers do not subscribe to this view. If we admit this view, then the destruction of a pot would also lead to the destruction of the mutual absence of the same pot. But we can truly say that a piece of cloth is different from that pot. If the *difference from a pot* is also destroyed due to the destruction of the pot, then we cannot find a fact which will correspond to the proposition 'this piece of cloth is different from that pot'. Similarly, before the production of a pot it can be said truly that a piece of cloth is different from a pot which will be produced. Since the past, present, and future objects are real, according to the Nyāya view, their differences are also real. Hence the propositions about these differences have truth values. For this reason the followers of the Navya-Nyāya do not subscribe to the view of Śivāditya Miśra. According to them both a never type of absence and a mutual absence of x are eternal entities.

(9) $\neg\neg x$.

Now let us discuss whether a not-yet type of absence of a not-yet type of absence of x is possible. According to the Nyāya a not-yet type of absence of a pot resides in the material cause of a pot. If we admit a not-yet type of absence of a not-yet type of absence of a pot, then it must be locatable either in the material cause of the pot or in the pot, or anywhere else. If it is locatable in the material cause of a pot, then it will have a contradictory property. Since there is no contradiction in reality, it is not possible. It cannot be identified with a pot, as there is no such pot when there is a not-yet type of absence of a pot. A not-yet type of absence has no beginning. If it were so, then its not-yet type of absence would not be possible. So the acceptance of $\neg\neg x$ will destroy the very nature of a not-yet type of absence.

(10) $\sim \neg x$.

A never type of absence of a not-yet type of absence of x, according to the Nyāya, is not identical with x. It is considered as a separate entity. Let us explain with an example. A not-yet type of absence of a pot is present in the material cause of it. A never type of absence of this absence characterizes all other objects. When a pot is produced this never type absence, being an eternal entity, is not destroyed. it still characterizes those objects. If it is identified with a pot, then it ceases to be a never type of absence because a pot is not eternal. Hence, $\sim\neg x$ is not identical with x.

(11) $-\neg x$.

Similarly, a mutual absence of a not-yet absence of x is not identical with x. It is a separate ontological entity, and characterizes all objects which are different from the not-yet type of absence of x. The not-yet type of absence of a pot is present in its parts which are material causes of a pot. The mutual absence of it, viz., the property *difference from this absence*, is a character of all other objects including the pot which will be produced and its parts. Hence, $-\neg x$ is not identical with x.

(12) $\lrcorner\neg x$.

Now let us discuss whether a no-more type of absence of a not-yet type of absence of x is identical with x. According to the classical view, it is identical with x. Let us consider the not-yet type of absence of a pot before the production of a pot. When the pot is produced this not-yet type of absence is destroyed. Hence, it is identical with the pot. Before the production of a pot, the not-yet type of absence of a pot was the character of the parts of a pot. When a pot is produced, the pot becomes a property of its parts. So a pot is nothing but a destruction of the not-yet type of absence of a pot.

But Raghunātha, a follower of the Navya-Nyāya, does not subscribe to this view. According to him it is a separate negative entity. When a pot is present in its parts we can apprehend the destruction of the not-yet type of absence in the same locus. If a pot is identical with the destruction of the not-yet type of absence of it, then it is not possible. Hence, it is claimed that $\sqcup\neg x$ is a separate negative entity and not identical with x.

(13) $\sqcup\sqcup x$.

A no-more type of absence of a no-more type of absence of x does not correspond to an entity. This follows from the very nature of a no-more type of absence. Since a no-more type of absence is endless or never ceases to exist, its destruction is not possible. Hence, the expression for it would not represent any real object. Hence, '$\sqcup\sqcup x$ does not represent an entity.

(14) $\neg\sqcup x$.

With respect to a not-yet type of absence of the no-more type of absence of x, there is some difference of opinion between the old Nyāya and Raghunātha. According to the old Nyāya it is identical with x. Let us consider the destruction or the no-more type of absence of a pot. Before the destruction of a pot there is the not-yet type of absence of it (destruction of a pot). This not-yet type of absence is the pot itself. Hence '$\neg\sqcup x$ is identical with x. Here also Raghunātha claimed that we can apprehend the not-yet type of absence of the destruction of a pot when a pot is present in its parts. If it is identical with a positive entity, then this type of apprehension of a

negative entity is not possible. Hence a not-yet type of absence of a no-more type of absence of x is a separate negative entity.

(15) $\sim\!\!\underline{\hspace{0.3cm}}x$.

A never type of absence of a no-more type of absence of x is not identical with x. A never type of absence is an eternal entity, but things like a pot or a cloth are non-eternal entities. Hence, it cannot be identified with a non-eternal entity. The no-more type of absence of a pot is present in the parts of a pot when it is destroyed. The never type of absence of this absence characterizes all other objects including the parts of a pot. Hence, $\sim\!\!\underline{\hspace{0.3cm}}x$ is not identical with x.

(16) $-\!\!\underline{\hspace{0.3cm}}x$.

Similarly, a mutual absence of a no-more type of absence of x is not identical with x. Since a mutual absence is an eternal entity and things like a pot or a piece of cloth are noneternal entities, a mutual absence cannot be identified with a noneternal object. When a pot is destroyed, a new object comes into being which has no end. The property *destruction of a pot* characterizes the parts of a pot, but the property *difference from this destruction* is present in all other objects including the parts of the pot. Hence, it is to be accepted as a separate negative entity which characterizes the things which are different from the destruction of a pot. For this reason $-\!\!\underline{\hspace{0.3cm}}x$ is not identical with x.[13]

From the above discussion of double negation it follows that some of the Nyāya philosophers, especially the followers of the old Nyāya, are trying to identify double negation of a positive entity with the positive entity itself or with a property which is a positive entity, but most of the followers of the Navya-Nyāya want to identify it with a negative entity. Following the suggestions of some Nyāya philosophers, it may be said that in most cases the double negation of x is not a separate ontological entity. It is another mode of presentation of x. As in the case of the never type of absence of a never type of absence of x, both the expressions '$\sim\!\sim\!x$' and 'x' refer to the same entity under different modes of presentation, so in cases like the not-

yet type of absence of the no-more type of absence of *x*, and the no-more type of absence of the not-yet type of absence of *x*, the same entity is referred to under different modes of presentation. This technique may be utilized wherever double negation can be explained without postulating a separate negative entity. This view will cut across the two other extreme theses found in the Nyāya literature. However, from this remark one should not conclude that all cases of double negation can be explained in this way.

NOTES

1. In this context the term 'cognition' is used to talk about the content of cognition, not the act of cognizing.
2. At the ontological level these elements need not be separate or distinct elements.
3. A discussion of this point requires a separate paper.
4. In this context I have not introduced the Nyāya distinction between a sentence which gives rise to a cognition and a sentence which describes this cognition. The latter is essentially richer than the former. This distinction has been discussed in [12].
5. There are a few conjunctions which are not occurrence-exacting relations.
6. For a discussion on this topic, see [10].
7. For a discussion on empty terms, see [9], [11].
8. According to some Nyāya philosophers, the property of being the counterpositive of a not-yet or no-more type of negation is not limited by a relation-limitor.
9. This law does not hold good with respect to the not-yet type of absence of a no-more type of absence.
10. According to the old Nyāya the property of being the counterpositive is limited by a generic property.
11. Jagadīśa says *"Prāgabhāva-dhvaṃsayorapi uttarapūrvakālāveva,"* quoted in Madhusūdana Nyāyācārya (1976).
12. But a section of the Nyāya philosophers do not subscribe to the thesis that a not occurrence-exacting relation other than identity cannot be the limiting relation of the property of being the counterpositive. Gadāhara in his *Vyutpattivāda* says, *Vṛtti-aniyāmaka-sambandhasya-abhāva-pratiyogitā-avacchedakatve-ko-doṣaḥ*, quoted in Kalipada Tarkāchārya (1973). For a discussion see [11].
13. In this section I have included some of the discussion from *The Padārthatattva Nirūpaṇaṃ*, translated and elaborated by Pandit Madhusūdana Nyāyācārya, and *Navya-Nyāya-Bhāṣāpradīpaḥ*, edited with commentary by Pandit Kalipada Tarkāchārya. I am also indebted to Pandit Visvabandhu Bhattacharya. However, the faults are mine.

The Middle Term

Sibajiban

Syllogism is traditionally conceived as a form of mediate inference. The distinction between mediate and immediate inference is usually stated thus: "For the most part a new judgement is only got by putting together two judgements, and as it were extracting what they yield. But there are a few conclusions which we appear to draw *not* from any 'putting together' of two judgements, but simply from the relation to one another of the terms in one judgement. This is called *immediate* inference ..." (Joseph [1], p. 232). According to Joseph, therefore, a syllogism to be a form of mediate inference has to fulfil two conditions: (a) there must be two judgements functioning as premises, and (b) the two premises must be 'put together' in order to yield the conclusion. We shall attempt here to examine the nature of 'putting together' of the two premises in syllogistic inference.

It is often contended that this 'putting together' of the premises is nothing but their conjunction. To say that the conclusion of a syllogism follows neither from the major premise alone, nor from the minor premise alone, but from the both 'put together' is simply to say that it follows from their conjunction. This is also necessary to explain why mediate inferences in general and syllogisms in particular ought to be regarded as logically valid implications with the conjunction of the premises as the antecedent and the conclusion as the consequent.

Against this theory we shall try to show that the conjunction of the premises cannot be regarded as explaining what it is to 'put them together', for this theory fails to bring out an essential feature of the middle term whether syllogism is considered as an inference or as an implication. To

explain our point we shall examine how we can get an instance of a syllogism from its *form*. Consider, for example, the form Barbara which is often stated as the logical law of the transitivity of class inclusion:

(B) $(b)(c)(a)(a \subset b . c \subset a . \supset . c \subset b)$

where 'a', 'b' and 'c' are class-variables. Now to get a concrete example of a syllogism of the form (B), it is usually thought necessary to have specific class-terms for the variables. This may be done in the following way:

(1) $(c)(a)(a \subset M . c \subset a . \supset c \subset M)$ (B), **U.I.**

Syl 1. (2) $(a)(a \subset M . K \subset a . \supset K \subset M)$ 1, **U.I.**

(3) $H \subset M . K \subset H . \supset K \subset M$ 2, **U.I.**

where 'H', 'M' and 'K' are abbreviations of 'the class of men', 'the class of mortals' and 'the class of kings'.

Now Syl 1 (3) can be regarded as a concrete example of Barbara, if we regard a syllogism as an implication. If, however, we want to *infer* 'all kings are mortal' ('$K \subset M$'), then we have to affirm the antecedent of Syl 1 (3) which is a conjunction. This we can do if we take this conjunction as a premise, thus:

(4) $H \subset M . K \subset H$ premise

(5) $K \subset H$ 3, 4 modus ponens.

Now we shall show that it is not necessary to specify the middle term in order to have an example of a syllogism.

(1) the same as (1) of Syl 1.

Syl 2. (2) the same as (2) of Syl 1.

(3) $(\exists a)(a \subset M . K \subset a) \supset (K \subset M)$ 2, by rules of quantification.

Syl 2 (3) in our opinion should be regarded as a concrete example of a syllogism of the form (B). If we now want to infer Syl 1 (5), then we have to assert

(4) $(\exists a)(a \subset M . K \subset a)$

which in our opinion should be the premise of the syllogism and not Syl 1 (4). For now we can have

 (5) K⊂M, 3,4 modus ponens

just as in Syl 1.

It may be noted here that our premise Syl 2 (4) is weaker than the conjunction Syl 1 (4) in the sense that it is implied by, but does not imply, Syl 1 (4). The difference between Syl 1 and Syl 2 is obvious. In Syl 1 we have specific class terms for all the variables of (B), whereas in Syl 2 we have left the middle term unspecified. Now the question is whether Syl 2 should be regarded as a syllogistic inference at all. We give the following reason for regarding it as a syllogism. If we accept the theory that the middle term of a syllogism need not be specified, then we can explain why given the conclusion 'all kings are mortal' we cannot uniquely determine the premises from which it follows, although in this particular case the figure and the mood are uniquely determined. This indeterminacy of the premises (not of the *form* of the premises) is due wholly to the fact that different middle terms can be used to construct premises from which 'all kings are mortal' can be deduced syllogistically. The theory that the conclusion of a syllogism follows only from a conjunction of its so-called premises fails to bring out this essential feature of the middle term. A conclusion can be derived syllogistically even if a conjunction of the premises like Syl 1 (4) is not a premise, for Syl 2 (4) suffices to prove the conclusion (in our opinion syllogistically).

So far we have accepted the theory that a syllogism has one premise (other than the form), but let us now see what happens if we accept the traditional view that a syllogism is an inference with two premises. Now if we are to have *two* premises, then, of course, we must have specific terms in both the premises where no term-variable can occur. Then the question will arise: What it is to 'put them together'? We can now have a conjunction like Syl 1 (4), for its two conjuncts are separately available. So should we not say that, *when the two premises are separately available*, it is their conjunction which is the result of 'putting them together'? Our reply to this question is

that the situation is not at all changed even when we have a specific term functioning as the middle term. For even when we use a specific term as the middle term of a syllogism the special properties of the objects denoted by the middle term are not relevant for the conclusion or for the syllogism. That is, if we know more specifically what the middle term is, even then it is only its relations to the major and the minor terms which are relevant to the syllogism. If we render Syl 2 (4) in ordinary English it becomes 'the class of kings is a subclass of *a class* which is itself a subclass of the class of mortals'. If we prefer the language of predication to the language of classes, we have the judgement 'that of which mortality is predicated (in a certain manner) is itself predicated (in a certain manner) of all kings'. This judgement may be regarded as involving predication of the second order, for that which is predicated of all kings is itself something of which mortality is predicated. Thus the 'putting together' of the two premises of a syllogism is not a mere conjunction of them, but is a complex judgement involving second order predication.

Now we sum up. The form of a syllogism may be conceived either as an implication with universally quantified term-variables, or as a form of inference with two premises 'put together'. In the first case, in order to get a concrete example of a syllogism it is not necessary to have a specific term functioning as the middle term. In the second case, although we must have a specific term as the middle term, yet the specific nature of the middle term is not relevant for the syllogism at all, and this fact should not be ignored when the premises are 'put together'. So the theory that the mere conjunction of the premises is necessary for a syllogism is unsatisfactory in both the cases and for exactly the same reason.

In the above we have tried to present the controversy between the Pūrva-Mīmāṃsā and the Nyāya schools of Indian philosophy on this issue. The philosophers of the Pūrva-Mīmāṃsā school insist that the knowledge of the specific nature of the middle term (*vyāpyatâvacchedaka-prakārakajñānam*) is necessary for syllogistic inference. Against this contention the philosophers of the Nyāya school, specially of the later period beginning from Gaṅgeśa Upādhyáya (circa 13th Century), claim that the

specific nature of the middle term need not be known. The argument given by us in the paper is taken from the Nyāya text of Viśvanātha, circa 17th Century, ([2], pp. 213 ff). We have translated the Nyāya term '*viśiṣṭa-vaiśiṣṭyâvagāhi-buddhi' loosely* by 'judgement involving second order prediction'.

Psychologism in Indian Logical Theory

J. N. Mohanty

The Indian logical theories, the Nyāya in particular, offer interesting models in the light of which one may hopefully throw new light on some of the persistent problems in philosophy of logic, which are generally discussed within the framework of Western thinking. The new possibilities that they open up could be instructive, at least by way of extending the boundaries of our available models, and we may be able, as a consequence, to see some of the limitations under which discussions in philosophy of logic are carried out. I want to discuss here one such problem: the issue about psychologism in logic.

1.

To begin with the <u>issue</u> of psychologism.[1] How is logic related to psychology? Briefly stated, psychologism is the view that theoretical foundations of logic lie in psychology. If one appeals to the rather commonplace distinction between how one ought to think and how in fact one does think, psychologism insists that ideal, logical thinking is but a species of thinking in general, and so is governed by the same rules that hold good of all thinking. The anti-psychologist philosophers, such as Frege and Husserl, argue, as against psychologism, that it in effect reduces the necessary truths of logic to the inductive, probabilistic laws of psychology; that it confuses between the laws of being-true and the laws that determine taking-something-to-be-true, between the objective entities with which logic

is concerned (such as concepts, propositions, theorems, theories) and the subjective and private events in peoples' minds, and finally that psychology as a science, i.e., as a theory, presupposes logic rather than <u>vice versa</u>. While psychologism is clearly at fault in seeking to derive the laws of logic from the way the human mind works (note that the idea of 'deriving' itself involves the logical principles), the extreme anti-psychologistic position leaves us with an unmitigated Platonism in the strong sense, a domain of abstract entities such as meanings, propositions and theories, sundered, on the one hand, from the mental acts of thinking and understanding which grasp them and, on the other, from the linguistic signs which "express" them. Is there any way to avoid these two alternatives?

The anti-psychologistic philosopher such as Frege is right in his intuition that the entities with which logic deals could not be privately owned, temporally individuated particulars, and that the logical truths are not inductive generalisations. But, it may be pointed out, he has an impoverished conception of mental life. This is certainly true of Frege, for whom the mental is the private particular and the laws about the mental are necessarily inductive generalisations. The question then for us is: why need we restrict ourselves to this impoverished concept of the mental? Is it not possible, given a suitably enriched philosophy of the mind, to give psychologism its due, while preserving the intuitions on which the anti-psychologistic positons are based?

I think that is possible. Indeed, there are several such systems already available. One is the Brentano-Husserl conception of an eidetic psychology. Another is to be found in the Indian logical theories, especially the Nyāya. In any case, what one needs is a conception of the mental according to which a mental event (or act) exemplifies or embodies a universal structure such that two or more numerically distinct mental events may exemplify or embody identically the same structure. In that case, within a mental event, one may distinguish between its particularity (which it shares with none other) and its universal features. Amongst universal features are to be counted not only such generic features as the property of being a belief or the property of being a desire, but also such specific features as 'being a

belief that p' or 'being a desire for a cup of tea'. In brief, what one needs is the conception of a <u>structure</u> of mental acts. Once you have such structures, then one can talk about essential truths about different sorts of mental acts. In that case, a logic of propositions and an eidetic psychology of mental acts in which those propositions are entertained would have a closer relation than the radical anti-psychologism of Frege would like to admit, and yet both that relation and the nature of the relata would preclude one from falling into the obvious errors of psychologism.

In the light of these general remarks, let me now give a brief sketch of the Nyāya concept of (mental)[2] acts. If <u>m</u> is a mental act, it has an owner, i.e. a self, it occurs at a time, it has what Husserl calls an act quality[3] (i.e. it is either a perceptual act or an act of remembering, or an inference, or a desire, or a hope, and so on) and finally it has a structured content (about which I have more to say below). Of course, the act has an object, but the object falls outside the act. What represents the object within the act is the structure. The act m may then be represented as an ordered quadruple [self, t, q, content], where 't' stands for the time of the occurrence and 'q' for the act-quality. Our present concern is with the content.

The content of an act is neither the object of that act (which is, on Nyāya realism, always out there in the world) nor a real constituent of the act (which, in Nyāya ontology, has no parts, and so is formless, <u>nirākāra</u>, if 'form' signifies the structural arrangement of parts). To begin with, let us call it--using a concept handily available in phenomenology--'intentional content.' It is the object not as it is in itself but precisely as it is being presented in the act under consideration. The object out there in the world may remain the same, but for a different act having the same object, the structure of the content may very well change, depending on how precisely that object is presented in the new act. Consider the two perceptual acts expressed in the sentences:

(1) '(This is a) blue jar.' ('<u>nîlo ghatah</u>')
(2) 'The blue (is) of the jar.' ('<u>ghatasya nîlah</u>')

It would appear that whatever is the object out there is not changed by the change of one's perspective. In (1), the primary object is the jar which is being perceived as qualified by the colour blue. In (2), the primary object is the colour blue which is being perceived as belonging to the jar. I will not expound in detail the Nyāya analysis of these structures.[4] It would suffice to note that for the Nyāya such a structure is a concatenation of a whole set of (epistemic) entities, each of which serves a specific function of either qualifying/determining/limiting or being qualified/determined/limited by some other. These peculiar entities are epistemic, for they do not exist in the object <u>per se</u>, they arise only when a cognitive act is directed toward the object. These entities as well as their concatenated structures are, in an important sense, universal-like: another cognitive act may embody precisely the same structure. What the logician has directly to deal with is a cognitive act insofar as it exhibits such a structure. We have then a criterion of identity for acts for the purposes of logical analysis. Two acts $\underline{m}_1$ and $\underline{m}_2$ are 1-identical, if they have the same act-quality and the same structure of their contents. The fact that they occur at different times and/or in different selves, is irrelevant.

At this point, one may wish to argue that the supposedly repeatable structure is nothing other than the proposition of Western logic. Two numerically distinct acts of belief are then 1-identical in so far as they are beliefs in the same proposition. If the structure is nothing but the proposition, and since the proposition is an abstract entity towards which one may take different attitudes, or the same attitude at different times--then a logic of propositions would have to be separated from a psychology of those attitudes. Now to appreciate the nature of the Indian logical theories, it is important to see why the content of a mental act as understood in the Indian logics is not the proposition of Western logic, not at least in one of the senses of 'proposition.' In this sense, which is also the sense in which detaching the proposition from the mental acts may be most persuasively effected, a proposition is that entity towards which many different, numerically as well as qualitatively different, attitudes and acts, belonging to the same or to different selves, may be directed. Now on the Nyāya

analysis of the content of an act, the quality of the act does often make a difference to the content. In the sense of 'proposition' just indicated, the supposition 'S may be P', the question 'Is S P?' the denial 'S is not P' and the affirmation 'S is P' are all directed towards the same proposition. This is not the case in Indian logic, where analysis reveals a different structure in the case of 'Is S P?' than in the case of 'S is not P', and a different structure in the latter than in 'S is P'.[5] But the affirmative categorical 'This mountain has fire' does express the same content, not only when it expresses the cognitions of two different persons, or of the same person at different times, but also when it expresses cognitions of different types: perception, inference, or śabda. This justifies bringing these under one generic group called 'anubhava.' This is not to deny that there are attempts to still more finely individuate the content even across these variations, so that the structure of the content would be different in the case of a śābda knowledge from that in the case of an inferential knowledge, both again different from the structure of a perceptual knowledge. The 'proposition' of Western logic is not as finely individuated across the range of varying propositional attitudes.

There is still another difference between 'proposition' and the 'content' of Indian logic. Proposition is an abstract entity towards which a mental act is directed. Irrespective of how strongly one may want to ascribe to it an ontological status, it is independent of, and transcends that, or in fact any act directed towards it. But the content which one, through reflective analysis, discovers in an act, is that act's structure, not its object, not a transcendent entity.

Let us now see how this applies to the case of an inferential knowledge with which logic is concerned in the first place. This would involve determining in what sense the theory of inference proposed is, or is not, psychological. Consider the following account to be found in the Nyāya treatises on inference:

One sees smoke on a distant mountain. This leads him to remember the rule "Wherever there is smoke, there is fire" which he recollects as having been instantiated in cases such as the familiar stove in the kitchen. He now

recognises the smoke he saw on the mountain as a mark of fire in accordance with the rule he just remembered. At this point, if there is no unexpected hindrance, the person would, as a matter of course, be led to draw the conclusion: "therefore, there is fire on this mountain." This last sentence is an expression of an inferential cognition that has been produced in him.

What we have is a sequence of psychological events: a perception, a remembrance, a recognition, leading finally to an inferential cognition. These events belong to one and the same self, and are individuated both by ownership and temporal position. Now how can any such temporal sequence yield a logical rule? We can do that by (i) replacing the particular person concerned by a variable and making a universal quantification over it; (ii) by retaining appropriate relations of succession, but doing away with the actual temporal positions; (iii) by identifying the cognitions involved by their contents and temporal positions relative to the other cognitions figuring in the rule; and (iv) by requiring that all cognitions figuring in the rule must have one and the same owner. We then get a rule such as the following:

> (3) For any knower S, if S has a perceptual cognition Fx, and then remembers the rule, "Wherever F, there G: as instantiated in the uncontroversial case O", and then perceives in x the same F as before but this time as figuring in the remembered rule "Wherever F, there G", then S will experience an inferential cognition of the form Gx, provided there is no relevant hindrance.

This indeed is as much a law in eidetic psychology as one of epistemic logic of inference. It is arrived at by an intuitive induction over particular cases, it is not a probabilistic inductive generalisation.

Another set of such laws with which the Nyāya logic operates consists of the rules of the form:

> (4) If a cognition of the type θ and with a structure T occurs at time t_n in a self S, then a cognition of the type ψ and with a structure T'

would not occur at time t_{n+1} in $\underline{S}$.

A simple and intuitively clear case of such a law is: if a person perceptually ascertains that -p, he cannot, at the immediately following moment, have a perceptual cognition that p. Or: if a person perceptually ascertains that p, that perceptual cognition will prevent the emergence, at the immediately succeeding moment, of an inferential cognition that -p (even if other conditions for the latter cognition are present).

These rules are further strengthened by bringing into consideration non-cognitive causal conditions such as desire to have a certain sort of knowledge. One cognitive type θ is said to be stronger than another cognitive type ψ, just in case if the causal conditions of both are present the one belonging to the type θ will occur and the one belonging to the type ψ will be prevented from occurring. Thus, if the causal conditions for a perceptual cognition of the fire on yonder mountain are present, as well as conditions for an inferential cognition of the same in the same person, then the perception will occur, preventing the inference from occurring. But suppose, in addition, that there is a desire to infer: presence of this new factor will cause the inferential cognition to occur even if the perception has just occurred. One may infer "There is fire on the mountain" even if one just saw the fire on the mountain top, if only one desired to so infer.[6]

Given such an eidetic psychology of cognitions of which rules such as the above are fundamental principles, one can have a theory of inference which is indifferently a logic and a psychology of inference, but which is not 'psychologistic' in the pejorative sense. But given this formulation of theory of inference, a serious question arises. If the rule formulated in (3) is also a psychological law, then it would seem as though all persons would necessarily make the right sorts of inferences under right conditions, and it would be nearly psychologically impossible to commit a logical fallacy. For if the logical rules of inference are also rules of appropriate cognitive occurrences, then it would be impossible for men, given the psychological constitution that we have, to violate those rules. Now this indeed is the most difficult question for a psychologistic theory of logic to answer. However, let

us try. The place we need to look at is the theory of invalid inference, or what has been called <u>hetvābhāsa</u> (to be construed as either defective <u>hetu</u> or the defects of <u>hetu</u>, <u>hetu</u> being the mark from which an inference is made). The standard definition of a defective <u>hetu</u> which would vitiate the inference in which it functions as <u>hetu</u> and would render it invalid is this: "the object of such knowledge as acts as the preventer of inferential cognition."[7] What is intended is, in brief, this: an inferential cognition of the form "S is P, because of m" would be prevented from occurring if the person under consideration has a knowledge of a situation which is, in fact, a defect of m <u>as a mark</u> of P-ness in S. Consider the obviously fallacious inferential cognition, "This lake possesses fire, because it possesses water." Such an inferential cognition can occur in a person only if he or she believes in the truth of the universal rule "Wherever there is water, there is fire." However, if the person recognises that wherever there is water there is the absence of fire, which amounts to recognising that the <u>hetu</u> or mark is characterised by the defect known as 'viruddha', or that the <u>hetu</u> is a <u>viruddha hetu</u>, then the inferential cognition would be prevented from taking place. This is rather a curious way of putting the matter. Instead of being told that the person made an inference that is fallacious, we are rather told that he or she would not have made the inference if only he or she had known that the <u>hetu</u> that was being employed was defective. One way of understanding all this--the one I prefer, for it meshes well with the account I have developed earlier in this paper--is to take the thesis to imply that as rational beings we cannot make a fallacious inference, we only appear to be doing so. Since the causal conditions of inference require, in accordance with (3), that the person concerned must believe in the <u>appropriate</u> rule "Wherever there is m, there is p", he or she can infer only if there is such a cognitive occurrence in his or her mind, so the inference he or she makes will always be formally valid. Now that he learns that in fact "Wherever there is m, there is -p", this cognition will prevent that other rule-cognition and so eventually the inferential cognition from occurring. The implication of course is clear: even when we are apparently making an invalid inference, we are making it because we not only do not detect the fallacy involved but also because we

are so construing the terms and the premises involved that the inference would turn out to be valid. Since psychologically it is impossible to make a fallacious inference, when we make an inference which by objective criteria is fallacious, what is happening is that we have given the premises and the terms, interpretations under which the logical and the psychological requirements are in fact satisfied. If those interpretations are changed--and this is what happens when the defect in the mark is recognised or pointed out--that inferential cognition would be prevented from recurring.

This is the price one pays for making the psychology of cognitions and the logic of propositions to coincide at least within the limits of elementary inferential operations. There is a concomitant <u>commitment to rationality</u> which rules out the possibility of making such obviously invalid inferences as "All men are mortal, Socrates is a man, therefore, Socrates is not mortal." However one who does make such an inference must be misconstruing the senses of the logical terms "All" and "not".

The thesis is not as improbable as it may look to be at first. Mary Henle has found out, by considering empirical data about errors in syllogistic reasoning by adults, that "where error occurs, it need not involve faulty reasoning, but may be a function of the individual's understanding of the task or the materials presented to him."[8] In another experiment, this time with children, Henle fails to find evidence that thinking transgresses the rules of syllogism.[9] In most cases, the subjects understood the premises in a manner that accounted for the error, while no faulty reasoning process was employed. The implications of her findings, as Henle sees them, are that "the two blind alleys of psychologism and of the radical separation of logic from the study of thinking" have to be avoided. Saying that our actual thinking process exhibits an (implicit) logical structure does not, in her view, amount to psychologism, for it does not make "logic coextensive with thinking by making it illogical. Rather than denying logical requiredness, denying the demands of necessary implication, it seeks to show that such requiredness is central in actual human thinking."[10] Such a conception of actual human thinking, I want to emphasise, is germane to the Indian logical theories, especially the Nyāya which finds the logical in the texture of everyday

actual processes of reasoning. This is done, as we have seen, by construing the mental processes of reasoning as rule-governed patterns of succession of cognitive events (jnānāni), the rules being not empirical generalisations but Brentano-like intuitive inductions.[11]

I would like to add, at the end, that the logical structure of a cognition should not be taken to coincide with the structure of the sentence which expresses that cognition, for one reason amongst others that there always shall be constituents of the cognition--e.g., the mode of presentation (a sla Sibajiban Bhattacharrya = Fregean Sinn)[12] --which cannot be expressed but can only be shown in that sentence. In other words, for an expressed sentential constituent, there necessarily shall be an unexpressed epistemic constituent. This should not be construed as suggesting an ineffability thesis, for what is unexpressed in that sentence can be expressed in another which, on its part, shall have its own unexpressed epistemic content. A given sentential structure does not then provide a clue to eliciting the epistemic structure unless it is aided or rather supplemented by reflective analysis of one's own cognition. Structural analysis and reflection on the inner cognitive events are, ideally, made to supplement each other.

Here we have a possibility which neither Frege nor Husserl, in their eagerness to reject and overcome psychologism, saw; but Husserl was closer to seeing it than Frege.[13]

NOTES

[1.] 'Psychologism' here should be understood in that sense or cluster of senses in which Frege and Husserl used it.

[2.] The acts are not, strictly speaking, mental for the Nyāya; for in the Nyāya ontology mind (manas) acts as an instrumental cause in the production of the acts, while the acts belong not to manas but to the self. Extensionally, though, we may identify the acts as 'mental acts'.

Tarka in the Nyāya Theory of Inference

Lawrence Davis

As Western scholars have interpreted the writings of the Nyāya school of Indian philosophy we find the Naiyāyikas espousing a doctrine which is false. The position we read into their writing involves a basic error in logic and, since the specialty of the Naiyāyikas was logic, their commission of such an error would be puzzling. The purpose of this paper is to explain the interpretation which has led to difficulty, discuss the nature of the Naiyāyikas' position, and propose a way of interpreting the texts according to which there is nothing logically objectionable in what the Naiyāyikas say.

I. The Nature of *Tarka*

The word *tarka* is used in several ways in Sanskrit. Its most general use is as *reasoning* of any sort, a kind of activity encouraged in some Vedic-period texts and discouraged in others.[1] In the Nyāya school its meaning is more specific. In particular, *tarka* is distinguished from *anumāna* (generally translated as *inference*), a type of reasoning which is described more or less formally by Gautama in the *Nyāyasūtras* (for a discussion of *anumāna* the reader is referred to Karl H. Potter's *Encyclopedia of Indian Philosophy*, vol. ii, Ch. 9.) Tarka has at least two senses in technical Naiyāyika discussions. It is viewed as a conditional (or subjunctive conditional) judgment in which each of the two judgments involved is false – "If water burned when drunk it would burn me too," for example. (Maṇikaṇṭha Miśra dissents from this characterization, arguing that "If the guest were to arrive he would have to

be fed" is an example of *tarka* even if the guest does arrive and is fed.[2] However, the prevailing tradition is represented by Varadarāja's statement that the cause of *tarka* (the antecedent of the conditional) is a mark superimposed on something which does not really have it, and the consequent of the judgment is erroneous.)[3] The second sense of *tarka* in the Nyāya school is reasoning from an original position to an unacceptable conclusion, thereby forcing the giving up of the original position. This sense is the most important – indeed, this sort of *tarka* is singled out by Gautama and his successors for special attention. Typically, reasoning of this sort uses *tarka* of the preceding sort, and we shall see that the Naiyāyikas may not have distinguished them. It is this sense of *tarka* which is the subject of this paper.

To begin with we shall consider what, in English philosophical terminology, *tarka* is. On this point commentators differ. One school of interpretation renders *tarka* as *reductio ad absurdum*. Thus we find Y. V. Athalye writing, "*Tarka – reductio ad absurdum* — requires some explanation."[4] Arthur B. Keith translates *tarka* as *reductio ad absurdum*, although he then notes that there are many varieties of *tarka*, only one of which is called *reductio ad absurdum* (the others seem to involve *reductio* reasoning only in a derivative sense.)[5] In a book devoted entirely to a discussion of *tarka* Sitansusekhar Bagchi translates *tarka* as "reasoning," although in the title of the book he characterizes it as "inductive reasoning" and in the text he writes, "Here as elsewhere reasoning assumes the form of a *reductio ad absurdum*."[6] Another school of thought is represented by Satischandra Vidyabhusana, who characterizes *tarka* as *confutation*, but notes that it may also be rendered as "argumentation, reasoning, hypothetical reasoning, *reductio ad absurdum*, etc."[7] A third approach is represented by S. S. Barlingay's characterization of *tarka* as implication with a premise in contrapositive form.[8] Finally, Karl H. Potter writes: "*Tarka* is sometimes rendered *reductio ad absurdum*, which is not altogether inaccurate, since *tarka* involves proposing a false hypothesis and then by showing it false proving the truth of its negation, or at any rate helping to prove the truth of its negation."[9] Elsewhere in the same work Potter writes,

"*Tarka* arguments are formally similar to 0 [an example of *modus tollens* reasoning], in that the first member is a counterfactual conditional proposition, the second denies the consequent of the conditional, and the conclusion is the denial of its antecedent."[10] Potter seems to hold, then, that *tarka* should be rendered formally as a type of *modus tollens* reasoning, whereas many of the other commentators have in mind a conception of *tarka* as a variety of informal argument.

The reason for the variation in these accounts is not that the commentators have misunderstood the texts, but rather that the texts are not at all precise in their characterization of *tarka*, as opposed to their characterization of *anumāna*. I shall argue that *tarka* was never considered a formalized pattern of reasoning by the Naiyāyikas. Certainly Gautama's definition is informal enough: "Tarka is causal reasoning about a thing whose nature is not known in order to know its nature."[11] Vātsyāyana's commentary on this passage provides the following example of *tarka* reasoning, following a doubt about whether knowers are originated or whether they have always existed:[12]

> Pain, birth, activity, defects, and wrong knowledge; each of these is the cause of what precedes it, and in the destruction of the latter each former thing disappears. This is liberation and in this way both transmigration and liberation occur. This would not be the case if the knower were originated. Indeed, an originated knower would be joined with a body, senses, intellect, and consciousness, but this would not be the result of actions performed by him [which is impossible, according to the theory of karma]. Furthermore, a thing which is originated does not abide [forever]. But there is no enjoyment of the fruit of one's own actions on the part of one who does not exist or who has been destroyed [the two options just considered] and thus there would be no connection of the single knower with many bodies nor eternal liberation from the body.

This concludes the argument. Vātsyāyana then goes on to say:

> Where one sees that the cause is not established, he does not accept it. So the definition is given [by Gautama]: "Tarka is reasoning [ūha]."

Succeeding accounts of *tarka* are similarly informal until the time of Varadarāja, who writes:[13]

> Through knowledge of its true natue [*tarka*] is declared to be endowed with five members: 1. pervasion, 2. not being countered by a *tarka*, 3. coming to a stop in error, 4. being unwished-for and 5. unfavorableness.

One's first impression is that this passage provides us with a formal account of *tarka* parallel to Gautama's account of *anumāna* as a five-membered inference pattern, but appearances are misleading. Let us consider a naive rendering of the five "members" in the predicate calculus:

T1
1 $(x)(Px \supset Qx)$ ("anything which is P is Q")
2 Qa ("a is Q")
3 $\sim Qa$ ("a is not Q")
therefore, $\sim Pa$ ("a is not P")

I have rendered (1) as a relation between properties rather than sentences because Varadarāja speaks of one property's being pervaded by another (i.e., having the other occur wherever it does). I have also left out the second "member" since it is a condition on soundness rather than a formal component of the inference. But T1 as it stands is unsatisfactory because each of the first three steps has the status of a premise and in this form the argument is too strong. (Anything follows from contradictory premises in the predicate calculus, and the second and third premises contradict.) By removing the second step we derive an argument of this form:

T2
1 $(x)(Px \subset Qx)$
2 $\sim Qa$
therefore, $\sim Pa$

The reader will recognize T2 as a variety of *modus tollens* reasoning, leading one to suggest it as a plausible rendering of Varadarāja's remarks. The case for T2 as the proper rendering is strengthened by consideration of the examples of *tarka* Varadarāja gives in his autocommentary on the five-membered version of *tarka.* Most of them consist of a single line of the form of (1) and one of them involves a statement of that form and a statement of the form of (2). None of them involve more formal complexity than this. Varadarāja's specimens of *tarka* reasoning include these:[14] "If drinking water did not satisfy the thirsty, then water would not be drunk by the thirsty," "If water which was drunk burned inside then it would burn me too, being no different," and, in a case of looking at bare ground and doubting one's eyes, "If there were a pot it would be seen, as the ground is, because of its connection with the ground in similar instances of perception. But it is not seen." A logician concerned with stating a new form of reasoning would not surround his statement with examples which failed to conform to it. Hence the view supported by the texts would seem to be that Varadarāja's treatment is intended to be informal, but if a formal version had to be given, it would be T2. Furthermore, such a treatment of *tarka* is compatible with the remarks of the other commentators cited earlier, since *modus tollens* may be viewed as a type of *reductio ad absurdum* and the other characterizations of *tarka* cited earlier are descriptive of both sorts of reasoning.

Against all this I wish to propose a different formalization, one which involves adding a line rather than deleting one. In particular, I wish to argue that Varadarāja has omitted a line which we would normally consider part of the *tarka* process when he listed its members, although he did conceive of that line as a member, in a sense to be specified directly. The interpretation I am proposing is as follows:

T3 1 Pa assumed

 2 $(x)\,(Px \supset Qx)$ premise

 3 Qa

 4 $\sim Qa$ premise

therefore, ~*Pa*

T3 is the formal representation of *reductio ad absurdum* – reasoning from a hypothesis to a contradiction and then to the rejection of the hypothesis. Given that Varadarāja does not list (1) as a member of *tarka* and given that his examples never display the prolixity of T3, why do I propose it as the proper rendering of *tarka*?

For two reasons. First, it seems clear that the Naiyāyikas had (1) in mind in their conception of *tarka*. Consider Udayana's definition of *tarka*, "*tarka* is giving scope to an undesired pervader by agreeing with the pervaded."[15] The point made here is that *tarka* involves an assumption of the antecedent of the conditional – an assumption which I include as (1). A second reason for adding a step rather than deleting one is that Varadarāja's account is not represented by T1 or T2 in another way. Line (2) of T1 is to be "coming to a stop in error," but T1 as it stands does not occur by coming to a stop since in T1 the relevant member is a premise rather than a conclusion and in T2 it is omitted altogether. By adding the first line of T3 the erroneous statement is gotten to by coming to a stop – it is inferred from the first two lines.

Why, then, don't we find the extra step when we are given a paradigm example of *tarka*? Because of the pragmatics of *tarka* use in the Nyāya theory. *Tarka* was involved when a doubt arose concerning the truth of a judgment arrived at by means of a *pramāṇa* (see the following sections for a discussion of *pramāṇas*). In reasoning, *tarka* was used to test one's own assumptions or conclusions or to test those of an opponent. Thus the first step of *tarka* has already occurred when *tarka* begins, and it has occurred as a part of a different process. This fact does not prevent *tarka* from being a part of the formalization in a Western system, but there is, I believe, an ontological assumption made by the Naiyāyikas which militates against such an approach. To allow parts of *tarka* to be members of two different sorts of mental acts would be to allow that there are wholes which overlap partially; that is, it would be to allow that there are wholes neither of which is contained completely in the other and which contain a common part. Although I know of no passages which pronounce clearly on the point, the

Nyāya theory of parts and wholes seems to have been like the theory of *jātis* – no overlapping relationships were permitted, (I am not claiming that this was a conscious or a formal reason for Varadarāja's omission of (1) as a step in the argument, only that it may have been a psychological one.)

At this point a few remarks about the status of the various formalizations we have considered are in order. Varadarāja was not proposing a formal account in his description of the five members of *tarka*. One indication of this is the fact that his second member is not a formal component of the argument, but rather a requirement on the soundness of the conditional judgment. Another is that *tarka* itself was not considered a valid form of argument *per se*, but rather a type of inference which, in Western terms, combines soundness and validity. Varadarāja wrote, "Given a defect in any of the members there would result the mere appearance of a *tarka*."[16] This passage is followed by examples of reasoning which are like the other examples of *tarka* except that they are based on false pervasions. In such examples Varadarāja writes that a *tarka* is nonexistent.[17] In the Western sense a formal argument is a pattern of inference which must yield a true conclusion when its premises are true, even if its premises do not happen to be true at the present time or in the world as it happens to be. In the Naiyāyika theory of inference *anumāna* and *tarka* are types of inferences which have true premises and a true conclusion. The defining characteristic of a valid inference form – that, given true premises of a certain form the conclusion *must* follow – does not seem to be given in the Naiyāyika texts. (One searches in vain for examples of inferences with false members which are described in terms suggesting the concept of validity.) What we have translated as formal inference patterns – *anumāna* and *tarka* – seem better understood as reasonings which combine soundness and validity, without these two features being explicitly distinguished.

Why didn't the Naiyāyikas arrive at a conception of formal validity? Because the vehicles of inference for them were different from those of the Western logician. For the Naiyāyika an inference is a series of *jñānas* – qualities of the self – rather than a series of sentences or propositions. A formal description does not arise as easily for mental occurrents as it does

for sentences, where the logical operators may be isolated and described. Hence the explanation for Varadarāja's non-formal account: He was giving a phenomenological account of *tarka* rather than a formal account. His examples were not intended to be read as sentences which together constituted the inferences. Rather they were to be taken as sentences descriptive of the mental states which were the inferences.

Thinking of matters in this way we arrive at the reason for the ambivalence between the two technical senses of *tarka* I referred to earlier: *tarka* in the first sense was a conditional judgment. *Tarka* in the second sense was a type of reasoning from one judgment, ending in a second, and causing the rejection of the first. Varadarāja (as opposed to Maṇikaṇṭha Miśra) was able to identify these two senses because everything occurring in an instance of the second type takes place in an instance of the first. To undergo a conditional judgment, in the sort of situation described by the Naiyāyikas as leading to an occurrence of *tarka* reasoning, is to entertain a judgment, move through a pervasion to a second which, as it is entertained, is felt to be false, and, still being entertained, causes a feeling of rejection of the first. Thus, phenomenologically, the Naiyāyikas identified the two senses of *tarka* and, since there is no formal account of *tarka* in the Nyāya literature, I conclude that *tarka*, as conceived of by the Naiyāyikas, was an informal variety of inference.

These considerations do not disallow us from attempting to describe *tarka* in formal terms, just as we are not disallowed from giving formal renderings of informal inference patterns in English. We must be aware that we are not giving an account in the terms of logicians who study it as an informal inference type, and we must be aware that we are isolating the components of the reasoning and describing them in sentence form, whether they be sentential in nature (as in the pervasion step) or affective in nature (as in the unwished-for step).

By now my justification for rendering *tarka* as T3 should be clear. The Naiyāyikas speak of assuming the antecedent, arriving at the consequent, seeing that the consequent is unacceptable, and rejecting the antecedent. Further, each of these aspects of *tarka* is mentioned in discussions of its

nature. The conclusion to draw is that each of these aspects is to be represented when *tarka* is formalized.

I wish to stress the natue of the point I have made since I shall argue in a similar way in the last section of this paper: It may well be that the Naiyāyikas did not regard all the members of T3 as separable from the conditional judgment involved in *tarka*. This creates no difficulty as long as it is realized that an account of the phenomenology of inference and a formalization of inference are not the same. Further, it may well be that the Naiyāyikas did not regard the initial step of T3 as part of *tarka*. If so, this demonstrates that their canons for determining members of inference patterns differ from Western ones. The initial step occurs as part of the process, its use is explicitly acknowledged by the Naiyāyikas, and its effects are discussed when *tarka* is discussed. *In a Western sense* the first step is a part of the pattern, even if it is not according to the Nyāya theory, and it is a Western version of *tarka* which I am attempting to derive here, based on what the Naiyāyikas have said.

II. The Problem with *Tarka*

In the Nyāya scheme of things the class of judgments (*jñānas*) contains these two subclasses: the set of *pramā jñānas* and the set of *apramā jñānas*. These terms are generally rendered into English as the set of true judgments (or knowledges, depending on the translator) and the set of untrue judgments (or knowledges). True judgments arise from one of four types of *jñānas* – perception (*pratyakṣa*), inference (*anumāna*), comparison (*upamāna*), and verbal testimony (*śabda*). The untrue judgments include doubt, error, and *tarka*.[18] According to this classification of things we find the Naiyāyikas in the unenviable position of asserting that *reductio ad absurdum* does not yield a true judgment. But *reductio* (or *modus tollens* – the problem arises for any of the formal renderings of *tarka*) is a valid inference form – if its premises are true its conclusion must be true as well. Varadarāja, at least, has asserted that the premises (2) and (4) of (T3) must be true. Why, then, do

the Naiyāyikas assert that a valid argument with true premises does not produce a true judgment as a conclusion? Even worse, why do they do so in the face of schools of Indian philosophy which do allow it the status of a *pramāṇa* – the Jains and the followers of Rāmānuja and Madhva, for instance? Let us consider their arguments for this position.

(1) From Gautama on the Naiyāyikas regarded *tarka* as a facilitator of the *pramāṇas* rather than as a *pramāṇa* itself,[19] and it may seem plausible to think that *tarka* is not a *pramāṇa* for the same reason that memory (*smṛti*) is not a *pramāṇa*: it does not give us any *new* knowledge. Among the Vaiśeṣika writers (and some of the Nyāya writers) memory is not a *pramāṇa* because, as Śrīdhara writes, "*Smṛti* always grasps objects which have been known previously by other means, and it is that other means which determines whether the judgment is valid or not."[20] *Tarka*, when used in reasoning for oneself, has a similar function. One perceives that there is no pot on the ground, acquiring knowledge through the *pramāṇa* of perception. One doubts the correctness of the knowledge – could there be an unperceived pot here? One resolves the doubt through *tarka*, concluding that there is no pot on the ground – a conclusion already established through perception.

This line of argument will not work for *tarka* employed against others. When an opponent asserts a position and one refutes it with *tarka* reasoning the conclusion may not be new for oneself, but it is certainly new for the opponent. In such (common) circumstances *tarka* does not seem to facilitate another *pramāṇa*. Instead it causes the opponent to be aware of a new truth. Varadarāja's characterization of *tarka* as issuing in the unacceptability of the first step shows that this conclusion is obtained through *tarka*, and clearly, this unacceptability was not previously recognized by the opponent. Hence this line of argument will not disallow *tarka's* status as a means to truth.

(2) Some of the Naiyāyikas classify *tarka* as a kind of doubt and some don't – Udayana for example[21] Aparārka asserts that indefinite knowledge (*anadhyavasāya*), imagination (*ūha*), and *tarka* are all members of the category of doubt (*saṃśaya*).[22] One can understand how such a classification might arise. According to the Naiyāyikas a doubt is a *jñāna* in which a

subject is considered as possessing two incompatible properties, and it is not known which one (if either) the subject really has. In T3 the assumption is considered at the beginning and (as mentioned above) the *tarka* argument is proposed as a test of it. In the case of *tarka* used for oneself it is not known at the beginning whether the assumption is correct or whether its negation is correct. This fact in itself, however, is not sufficient to account for *tarka's* being rendered as a species of *doubt*, since the conclusion of a *tarka* is not doubted. It might be proposed that doubt arises at the end of the *tarka* argument because the first premise has been established by one argument and the conclusion – the negation of the first premise – has been established by another, creating doubt. But this doubt is not *necessarily* a feature of the argument and in fact many disputants who work through an argument in the *anumāna* form experience doubt, leading them to the use of *tarka*. This fact disqualifies neither type of argument from the status of a *pramāṇa*. The classification of *tarka* as a sort of doubt I believe to arise by default after *tarka* has been disallowed as a *pramāṇa* for other reasons.

(3) The members of *tarka* as represented in T3 include the assumption of a false judgment and the derivation of another, leading Udayana to classify *tarka* as a species of error.[23] In considering the objection that *tarka* cannot facilitate the *pramāṇas* (much less be one) because it involves error, Varadarāja concedes the objection concerning error and defends *tarka* on pragmatic grounds, citing a prior view that the unwished-for result of *tarka* can cut off one's desire to believe a false position, aiding the *pramāṇas* in their work. These remarks are not liable to sway a Western logician because the offending members of T3 are (1) and (3), an assumption and a conclusion derived under an assumption, rather than premises in themselves. If the *premises* of T3 are true the conclusion follows, and there is no further trouble about it – so says the Western logician. The Nyāya ontology did not contain a place for assumed *jñānas*, however, and this understanding of *tarka* would not be open to them without an alteration of their classification of existents.

The reader is referred to Bagchi's book on *tarka*[24] for a series of arguments against allowing the status of a *jñāna* to hypothetical reasoning,

but such passages do not seem to me to be convincing. What underlies the discussion is a sort of contamination theory of judgment according to which falsehood in a part of a judgment flaws the whole. I believe there are good psychological reasons for such a position. According to the *sūtras* the purpose of studying Nyāya is to achieve salvation through understanding things as they are. *Tarka* involves understanding things as they are not, and the consciousness of the user of *tarka* undergoes false *jñānas* when *tarka* is employed. A concern for the purity of consciousness could lead philosophers to distinguish those means to truth which do not involve false judgments from those which do. My view is that this concern motivated many of the Naiyāyikas to disallow *tarka* as a *pramāṇa*. Nonetheless we must note that *tarka* is used more frequently than *anumāna* in Naiyāyika disputation and that its results are accepted and employed in subsequent discourse. I have mentioned previously that the Naiyāyikas require sound premises in order for an inference to count as a case of *anumāna* or *tarka*. Now let us note a related fact, that the parts of each step of an inference must be true in order for it to count as a *pramāṇa*.

(4) Another line of argument in the Nyāya texts disallows *tarka* as a *pramāṇa* because it does not yield the sort of result which a *pramāṇa* yields. Correct employment of a *pramāṇa* yields understanding of things as they are, while correct employment of *tarka* does not. Uddyotakara's comments on this point are typical. In describing the difference between *tarka* and ascertainment he wrote that in the latter the result is a detailed understanding of something, while the result of *tarka* is only that something ought to be the conclusion.[25] Said another way, this point is that the result of the *pramāṇas* is a state of accepting and an understanding of what is to be accepted. From *tarka* one derives a negative conclusion – a psychological state of rejection – connected to an understanding of something. This line of argument will not persuade the Western logician, since negative conclusions may be as true as positive ones, and it is truth which counts in Western logic rather than the nature of one's understanding of that truth.

There is an interesting difference between the Nyāya theory of inference and the formal logic of the West on this point. As noted earlier, the Nyāya

theory takes an inference to be a succession of *jñānas* – qualities of the self – while the Western view takes an inference to be a series of sentences or propositions (depending on one's orientation), either of which are qualities of the self. According to the Nyāya view, put crudely but, I hope, not misleadingly for present purposes, knowledge of things as they are is a mental state which involves constituents and relations corresponding to an external object. The result of *tarka* reasoning is more complicated, being a state with constituents and relations which are unlike the object of the state, together with a feeling of rejection. This sort of state is not adequately described by a negative declarative sentence of the ordinary sort since according to the Naiyāyikas negative declarative sentences represent *jñānas* containing *absences.* The sentence "There is no pot on the ground" represents a mental state including the component *absence-of-pot.* This is the typical Naiyāyika treatment of negation, but this treatment is not given to the conclusion of *tarka* reasoning, a *jñāna* which shows what ought to be ascertained but does not in itself constitute ascertainment. Here the Naiyāyika has drawn a distinction where a Western logician does not, between a negative judgment which is a rejection of a false judgment and a judgment which includes a negative component. Such a distinction *can* be drawn in Western terminology – I have just drawn it – but it is not necessary to draw it in order to assess the validity of an argument form, and validity is a prime concern of Western logicians, together with the determination of truth values. The primary concern of the Naiyāyikas lay in acquiring a state of mind which represented reality through a kind of isomorphism, and the truth of a judgment (in Western terms) was not as important as the relation between the judgment and reality which constitutes its truth.

III. A Solution to the Problem

The Naiyāyikas believed that *tarka* is not a *pramāṇa.* I have argued that *tarka* is best represented in Western terms as *reductio ad absurdum.* It is

customary to translate *pramāṇa* as "means to truth," or something similar. In so doing we arrive at the problem discussed in the previous section, "Why didn't the Naiyāyikas think that *reductio ad absurdum* is a means to truth?" Of the many responses to this question, let us consider three common ones. A person might contend that the Naiyāyikas were simply wrong and that we should regard their position as a curiosity produced by a school of logicians lacking a conception of formal validity. Or one might hold that the Naiyāyikas experienced deeper insights into the nature of things than we do, that they have discovered a sort of truth which Western logicians are unaware of, involving actual perception of things as they are and leading to a rejection of means to lesser truths. Or one might hold that the Naiyāyika scheme of things is obviously so alien to the Western scheme that attempts to explain the one in terms of the other are best avoided.

My own position is different from these but, arising as it does from belief in the non-extraordinary but quite competent abilities of the Naiyāyikas as students of human reasoning, together with belief in the ultimate communicability of philosophical schemes between languages and cultures, it may not be acceptable to proponents of the views I have already outlined. In these matters one must choose one's own methodology and operate according to it. In my view one arrives at a rendering of a position formulated in a different language by postulating equivalents between words of the two languages and testing the result for sequences of arguments and discussions of them. This process – seized upon for criticism in another context by Quine[26] and singled out for discussion by hermeneuticists – is the only way we have to represent the positions of the Naiyāyikas to Western philosophers. The problem which has arisen concerning *tarka* is evidence that the connections which have been established between the Sanskrit terms we have discussed and their proposed English equivalents require some modification. Let us consider two such modifications and their results:[27]

(1) The translation of *pramāṇa* as "means to truth" is misleading in that the Naiyāyikas intend it to exclude some procedures which are clearly means to truth – *tarka*, for instance. The arguments are explicit on this

point: to be a *pramāṇa* is to be a special means to truth, such that no false judgment is entertained while the means is being employed, and such that the result is a knowledge of the true nature of things rather than, e.g. a rejection of a false view of the nature of things. (Deriving from this modification would be the understanding of *pramā* as knowledge of the nature of things or such knowledge gained without the consideration of false judgments.)

(2) The translation of *anumāna* as "inference" is similarly misleading. It is commonly held that the Naiyāyikas employed only one type of inference – *anumāna*. It should be clear enough from what has been said that *tarka*, too, was a type of inference, in Western terms. It was distinguished from *anumāna* but it played the role an inference plays in reasoning and its nature was characterized (although not formally) by Varadarāja. The conclusion to draw from these facts is that "inference" is not the best translation of *anumāna*. Instead one should read *anumāna* as "inference of a certain form comprised of judgments none of which are untrue". This alteration will have consequences for our reading of *pramā*, which will no longer be translated as "truth" but as "truth which involves things as they are."

In making these alterations the connections between the Sanskrit and English technical terms have been altered in an interesting way. I am suggesting that we acknowledge a difference in concern between the Naiyāyikas and the Western logicians. The concerns of the Naiyāyikas were of a spiritual sort – the purity of consciousness and the absolute liberation of the self – and this led them to make distinctions between types of inferences and types of understandings of truths which are not typically made in the West. The concern of the Western logician is for formal validity and truth-conditions. This leads a Western logician to concentrate on those aspects of reasoning and leave aside considerations of the nature of our conceptions of truth. This does not mean that the distinctions cannot be made (proof lies in the body of this paper). It does not mean that the Naiyāyikas were poor logicians – it is our preliminary correlation of technical terms which produces this impression. And so far I have not presented any argument to

the effect that the Naiyāyikas were philosophers of greater metaphysical insight than Western philosophers. As a result the conclusions of this paper may seem unappealing. I have recommended the introduction of a good deal of verbosity in rendering Nyāya texts and I have done away with some fascinating (but wrong) position in the area of philosophy of logic. Nevertheless I urge the consideration of these proposals by the reader, for they seem to me to yield fairer renderings of the Nyāya positions and their adoption will have interesting consequences for our understanding of many other aspects of Nyāya – the controversy over the nature of *pramāṇas*, for one.

University of Hawaii at Manoa

NOTES

[*] This paper is based on research conducted in an NEH Summer Institute on Indian Epistemology directed by Prof. J. N. Mohanty. The NEH support, the comments of the Institute participants – Prof. Mohanty in particular, and the comments of my colleagues at the University of Hawaii have all been helping in bringing the paper to its present form. I am also grateful for the assistance of Prof. Walter Maurer, who consulted with me on several Sanskrit passages.

[1] See S. C. Vidyabhusana's *A History of Indian Logic*, Motilal Banarsidass, 1971, pp. 36–39 for an account of the status of logic (*ānvīkṣikī*) in Vedic times. Citations of anti-logical attitudes given by Vidyabhusana include warnings to Vedantins against divulging their doctrines to logicians and a tale in the Mahābhārata of a Brahman who carried on debates without adhering to the Vedic faith and became a jackal in his subsequent life. Vidyabhusana also cites cases of penalties inflicted on logicians and ridicule of Gautama as "Gotama," "the most bovine" – a Sanskrit pun. Pro-logical passages cited include the endorsement of logic when it does not conflict with the Vedas or the laws of Manu and a variety of attestations to the utility of the discipline of logic, culminating in the according of formal status to Nyāya as an orthodox *darśana* after the time of Gautama.

[2] *Nyāyaratna* of Maṇikaṇṭha Miśra, E20–26, as summarized by V. Varadachari (reference follows that in Potter's *Indian Metaphysics and Epistemology*.)

[3] *Tarkasya viṣayakāraṇaprayojanāni darśayati. Asyāvijñātatattvo arthaḥ sandigdho viṣayo mataḥ heturāropitaṁ liṅgaṁ phalaṁ tattvārthanirṇayaḥ.* Varadarāja's *Tārkikarakṣā* I.73 and autocommentary, p. 190 in V. P. Dvivedin, (ed.), reprinted in *The Pandit*, 1903.

[4] *Tarka-Saṁgraha* of Annambhatta, edited and commented on by Y. V. Athalye, Bombay Sanskrit Series, 1930, p. 356. Athalye goes on to provide some additional remarks as to what *tarka* is and isn't.

So ayamevaṁlakṣaṇa ūhastarka ityucyate.*

From Vātsyāyana's *NyāyaBhāṣya* on *NyāyaSūtra* 1.1.40, in *Nyāyadarśana of Gautama*, Anantalal Thakur, (ed.), Mithila Institute, Darbhanga, 1967, p. 581.

The translation is mine. In the case of the passage "*Utpannaśca bhūtvā na bhavatīti*" I have followed N. S. Junankar in his *Gautama: the Nyāya Philosophy* (Motilal Banarsidass, Delhi, 1978). Whatever one's rendering of this phrase, it will not affect the point being made by citation of the passage.

I have not translated "*viṣaya*" in the compound "*dehendriyaviṣayabuddhivedanābhiḥ*" following the editor's suggestion that it may be an incorrect interpolation. This, too, does not affect the point the passage is being used to make.

13 *Aṅgapañcakasampannastattvajñānāya kalpate. … Vyāptistarkāpratihatiravasānaṁ viparyaye. Tārkikarakṣā* 1.71–72, pp. 186–7.

14 Ibid., pp. 185–204. These are the examples quoted: *Yathā yadyudakaṁ pītaṁ pipāsāṁ na śamayettarhi pipāsunā na pīyeta*, autocommentary on I.70, p. 185; *Yadyudakaṁ pītaṁ paramantaradhakṣyattadaviśiṣṭaṁ māmapi dahet*, autocommentary on I.70, pp. 185–6; … *iha bhūtale ghaṭo nāstīti bhūtalavadghaṭābhāve pi pravartamāna yadyabhaviṁyatghaṭo bhūtalamivādrakṣyattasya tena saha tulyadarśana-yogyatvāt*, autocommentary on 1.75, pp. 200–201.

15 *Vyāpyāngīkāreṇāniṣṭavyāpakaprasañjanaṃ tarka iti*, Udayana's (or Śivāditya's – the point has been disputed) *Lakṣaṇamālā*. The definition is quoted by Varadarāja in the autocommentary on the *Tārkikarakṣā*, p. 191.

16 *Aṅgānyatamavaikalye tarkasyābhāsatā bhavet, Tārkikarakṣā* I.73, p. 188.

17 *Ukteṣvaṅgeṣvanyatamasyābhāve tarka ābhāso bhavati*, autocommentary on the *Tārkikarakṣā* I.73, p. 188.

18 The classification is taken from Satischandra Chatterjee, as presented in Potter's *Indian Metaphysics and Epistemology*. It does not represent the position of every Naiyāyika, but the classifications relevant to this paper – especially that of *tarka* as a non-*pramāṇa* – were universally adhered to within the school.

19 See fn. 11. The position is reiterated in subsequent texts. Varadarāja, for example, writes *Pratyakṣādeḥ pramāṇasya tarkonugrāhako bhavet.* (Tārkikarakṣā I.74, p. 193). See the subsequent commentary for a discussion of the manner in which it does the facilitating.

20 *Nyāyakandalī* on the *Padārthadharmasaṃgraha*, by Śrīdhara, Durgodhara Jha Sarma, (ed.), p. 627.

21 In the *Kiraṇāvalī* II.91–93 Udayana classes *tarka* as a variety of error (*viparyaya*) instead of a type of doubt. But his reason is that error is due to the apprehension of a different property in a given locus (II.95, as summarized by Bimal K. Matilal in *Indian Metaphysics and Epistemology*.)

22 In Aparārka's *Nyāyamuktāvalī*, commenting on Bhāsarvajña's *Nyāyasāra*, section 4 (as summarized by S. S. Sastri in *Indian Metaphysics and Epistemology*.)

26 Chapter II of *Word and Object*, Willard van Orman Quine, M.I.T. Press, Cambridge, Mass. There Quine sets forth his doctrine of the "radical indeterminacy of translation," the consequence of which would seem to be that a "best" translation of the sort I have aimed at in the text, cannot be settled on.

27 S. S. Barlingay attempts to solve the problems raised in this paper in a fashion methodologically similar to the way I have attacked them in *A Modern Introduction to Indian Logic*, pp. 121–128, but his conclusions are different.

Anekānta: both yes and no?

Bimal Krishna Matilal

I

A metaphysical thesis, in the context of classical Indian philosophy at least, usually (more often than not) takes the form of such a proposition as 'Everything is *F*' or 'Nothing is *F*'. Philosophical rivalry springs from the varieties of such proposed positions, that is, varieties of such *F*s. For example, the Advaita Vedānta says, 'Everything is Brahman', the Mādhyamika, 'Everything is empty of its own-being or own-nature', and the Yogācāra, 'Everything is a *vijñāpti* making of consciousness'. We may add to the list even such positions as 'Everything is non-soul, impermanent and suffering' (the Buddhist in general), and 'Everything is knowable and namable' (the Nyāya-Vaiśeṣika). If we have to add the Jainas to the list, then we can say that their position is: Everything is 'non-one-sided' *anekānta*. However, I shall argue that at least on one standard interpretation, the Jaina thesis is held at a slightly different level; if the others are called metaphysical, this one may be called meta-metaphysical. The sense of it will be clear later on. I do not wish to claim this to be the 'one-upmanship' of the Jainas. The claim here is a modest one; it harks back to the historical origin of the position.

It is rather hard to see how such metaphysical theses as illustrated above, in the form of 'Everything is *F*', can be proven in a straightforward manner. They are often presuppositions, sometimes accepted as an axiom of a system. The argument, if there is any, must be indirect or *reductio-ad-absurdum*, it is persuasive and suggestive. It may be pointed out at this stage that according

to the later Nyāya school any argument that has a conclusion (a thesis) of the form 'Everything is *F*', is fallacious, because it would be inconclusive. To use their technical vocabulary, the inferred conclusion of the form 'Everything is *F*' (where 'Everything' is the subject term, playing the role of a *pakṣa*), is faulty because it suffers from the defect called *anupasaṃhārin.* Such a defect occurs when and only when the *pakṣa* (the subject locus) is *kevalānvayin* which corresponds to a universal class. Strictly speaking, we should say that the property that qualifies the subject locus here, that makes it what it is, a subject-locus, is a universal (or everpresent) property. Such being the case, we cannot *compare* or *contrast* it with anything else. The Indian theory of inference, on the other hand, depends essentially upon the possibility of such comparison (by the citation of a *sapakṣa*) and contrast (by the citation of a *vipakṣa*). This does not make the Indian or the Nyāya theory a theory of inference based upon analogy. It only certifies its empirical, that is its non-*a priori*, character. Proving something to be the case here means to make it intelligible and acceptable by showing how, (1) it is similar to other known cases and (2) what it differs from and in what way. This demand on the proof is much stricter than usual. Otherwise, the Indians will say that something may actually be the case but it cannot be claimed or established as such. Hence the inconclusiveness (*anaikāntika*) of the said type of inferences was regarded as a defect, a *hetvābhāsa*.

A metaphysical thesis was usually expressed in the canonical literature of Buddhism and Jainism in the form of a question 'Is *A B*?' 'Is everything *F*?', to which an answer was demanded: either yes or no. If yes, the thesis was put forward as an assertion, that is, the proposed position '*A* is *B*' or 'Everything is *F*' was claimed to be true. If no, it was denied, that is, it was claimed as false. Therefore, 'yes' and 'no' were substitutes for the truth-values, true and false. The Buddhist canons describe such questions as *ekāṃśa-vyākaraṇiya*, those that can be answered by a direct yes or no. However, both the Buddha and the Mahāvīra said that they were followers of a different method or style in answering questions. They were, to be sure, *vibhajya-vādin*, for they had to analyse the significance or the implications

of the questions in order to reach a satisfactory answer. For, it may be that not everything is *F*, although it may not be true that nothing is *F*.

The followers of the Mahāvīra developed their doctrine of *anekānta* from this clue found in the canonical literature. This is the clue of *vibhajya-vāda*, which originally meant, in both the Buddhist and Jain canons, a sort of openness—lack of dogmatic adherence to any viewpoint exclusively. The philosophy of Jainism has been called 'Non-dogmatism' or 'Non-absolutism'. I prefer the literal rendering 'non-onesidedness', for it seems to retain the freedom of the interpreter as well as its open-endedness.

A metaphysical puzzle seems to have started in the early period in India (as it did in Greece too) with a dichotomy of basic predicates or concepts such as, being and non-being, permanence and change, is and is-not, substance and modes, identity and difference. Although the five pairs just cited are not strictly synonymous, they are nevertheless comparable and often interchangeable depending, of course, upon the context. The first of these pairs used to be captured by a common denominator, *à la* the Buddhist canons, called Eternalism or *śāśvatavāda*, while the second pair constituted the opposite side, Annihilationism or *uccheda-vāda* (sometimes, even Nihilism). In the same vein, i.e. the vein of rough generalization, we put the spirituality of reality on one side and the materiality of reality on the other. Looking a little further we can even bring the proverbial opposition between Idealism and Realism, in their most general senses, in line with the above pairs of opposites.

Avoidance of the two extremes (*anta* = one-sided view) was the hallmark of Buddhism. In his dialogue with Kātyāyana, the Buddha is said to have identified 'it is' as one *anta* (= extreme) and 'it is not' as the other extreme, and then he said that the Tathāgata must avoid both and resort to the middle. Hence Buddhism is described as the Middle Way. The Mahāvīra's *anekānta* way consisted also in not clinging to either of them exclusively. Roughly, the difference between Buddhism and Jainism in this respect lies in the fact that the former avoids by *rejecting* the extremes altogether while the latter does it by *accepting* both with qualifications and

also by reconciling between them. The hallmark of Jainism is, therefore, the attempted reconciliation between the opposites.

II

It would be better to start with some traditional descriptions of the concept of *anekānta*. An alternative name is *syādvāda*. Samantabhadra describes it as a position 'that gives up by all means any categorically asserted view' (*sarvathaikāntatyāgāt)* and is dependent (for its establishment) upon the method of 'sevenfold predication' (*Āptamīmāṃsā*, 104). Malliṣeṇa says that it is a doctrine that recognizes that each element of reality is characterized by many (mutually opposite) predicates, such as permanence and impermanence, or being and non-being. It is sometimes called *vastu-śabala* theory (SdM, p. 13), that underlines the manifold nature of reality. Manifoldness in this context is understood to include mutually contradictory properties. Hence, on the face of it, it seems to be a direct challenge to the law of contradiction. However, this seeming challenge should not be construed as an invitation to jump into the ocean of irrationality and unintelligibility. Attempts have been made by an array of powerful Jaina philosophers over the ages to make it rationally acceptable. We will see how.

Guṇaratna Sūri, in his commentary on Haribhadra's *Sarva-darśanasaṃgraha*, says that the Jaina doctrine is to show that the mutually opposite characterization of reality by the rival philosophers should be reconciled; for, depending upon different points of view, reality can be discovered to have both natures, being and non-being, permanent and impermanent, general and particular, expressible and inexpressible. The Jainas argue that there are actually seriously held philosophical positions, which are mutually opposed. For example, we can place the Advaita Vedānta at one end of the spectrum, as they hold Brahman, the ultimate reality, to be non-dual, permanent, substantial, and an all-inclusive being. This is where the 'being' doctrine culminates. The Buddhists, on the other hand, are at the other end of the spectrum. Their doctrine of momentariness (as well as

emptiness) is also the culmination of the 'non-being' doctrine, which can also be called the *paryāya* doctrine. Traditionally, in Jainism, *dravya* 'substance' ('permanence', 'being') is contrasted with *paryāya* 'modification', 'change' or even 'non-being'. One should be warned that, by equating Buddhism with 'non-being', I am not making it nihilistic. For 'non-being' equals 'becoming'. *Paryāya* is what is called a process, the becoming, the fleeting or the ever-changing phases of the reality, while *dravya* is the thing or the being, the reality which is in the process of fleeting. And the two, the Jainas argue, are inextricably mixed together, such that it does not make any sense to describe something as exclusively 'permanent', a *dravya*, without necessarily implying the presence of the opposite, the process, the fleetingness, the impermanence, the *paryāya*. Being and becoming mutually imply each other, and to exclude one or the other from the domain of reality is to take a partial (*ekānta*) view.

The idea is not that we can identify some elements of reality as 'substance' and others as 'process' or *paryāya* Rather, the claim is that the same element has both characteristics alternatively and *even simultaneously*. It is the last part, 'even simultaneously', that would be the focus of our attention when we discuss the sevenfold predication. The challenge to the law of contradiction that we have talked about earlier can be located, in fact, pinpointed, in this part of the doctrine. The *anekānta* has also been called the *ākulavāda*, a 'precarious' doctrine. The idea is, however, that it challenges any categorically asserted proposition, ordinary or philosophical. Its philosophical goal is to ascribe a 'precarious' *value* to all such propositions. It condones changeability of values (i.e. truth-values). However, it does not amount to scepticism, for the manifoldness of reality (in the sense discussed above) is non-sceptically asserted. It is also not dogmatism, although it can be said that they were dogmatic about non-dogmatism.

III

How do the Jainas argue in favour of their position and answer the charge of irrationality and unintelligibility? Traditionally, their method of *saptabhaṅgī* or 'sevenfold predication' as well as their doctrine of 'standpoints' (*nayavāda*) supplies the material for the constructive part of the argument. To answer criticism, however, they try to show how contradictory pairs of predicates can be applied to the same subject with impunity and without sacrificing rationality or intelligibility. This may be called the third part of their argument. I shall comment on the last by following an outstanding Jaina philosopher of ninth century A.D. Haribhadra. In another section, I shall discuss the first part, the sevenfold predication, before concluding with some general comments.

In his *Anekāntajayapatākā* ('The Banner of Victory for Anekānta'), Haribhadra formulates the opponents' criticism as follows (we will be concerned with only a few pages of the first chapter). He first selects the pair: *sattva*, 'existence' or 'being', and *asattva*, 'non-existence' or 'non-being'. The opponent says G.O.S. 1940 edn., p. 11):

> Existence is invariably located by excluding non-existence, and non-existence by excluding existence. Otherwise, they would be non-distinct from each other. Therefore, if something is existent, how can it be non-existent? For, occurrence of existence and non-existence in one place is incompatible …

> Moreover, if we admit things to be either existent or non-existent, existence and non-existence are admitted to be properties of things. One may ask: are the property and its locus, the thing, different from each other? Or are they identical? Or, both identical and different? If different, then, since the two are incompatible, how the same thing can be both? If identical, then the two properties, existence and non-existence, would be identical. … And if so, how can you say that the same thing has (two different) natures?

> <div align="right">(pp. 11–12)</div>

The main point of the argument here depends upon reducing the Jaina position to two absurd and unacceptable consequences. If the properties (or the predicates) are incompatible (and different), they cannot characterize the same entity. And if they are somehow shown to be not incompatible, the Jainas lose their argument to show that the same entity is or can be characterized by two incompatible properties. Haribhadra continues:

> If they are both, identical and different, we have also two possibilities. If they are different in one form or one way and identical in another way, then also the same cannot be said to have two different natures. However, if they are different in the same way as they are identical with each other, this is also not tenable. For there will be contradiction. How can two things be different in one way, and then be identical in the same way? If they are identical, how can they be different?" (pp. 12–13)

This is the opponent's argument. The formulation is vintage Haribhadra. Now the answer of Haribhadra may be briefly given as follows:

> You have said 'How can the same thing, such as a pot, be both existent and non-existent?' This is not to be doubted. For it (such dual nature of things) is well-known even to the (unsophisticated) cowherds and village women. For if something is existent in so far as its own substantiality, or its own location, or its own time or its own feature is concerned, it is also non-existent in so far as a different substantiality, a different location, a different time or a different feature is concerned. This is how something becomes both existent and non-existent. Otherwise, even such entities as a pot would not exist.
>
> (p. 36)

The existence of an entity such as a pot depends upon its being a particular substance (an earth-substance), upon its being located in a particular space, upon its being in a particular time and also upon its having some particular (say, dark) feature. In respect of a water-substance, it would be non-existent,

and the same with respect to another spatial location, another time (when and where it was non-existent), and another (say, red) feature. It seems to me that the indexicality, or the determinants of existence, is being emphasized here.

To make this rather important point clear, let us consider the sentence:

It is raining.

This would be true or false depending upon various considerations or criteria. It would be true if and only if it is raining, but false if it happens to be snowing. This may correspond to the 'substantiality' (*dravyataḥ*) criterion mentioned by Haribhadra. Next, the same would be true if and only if it is raining at the particular spot where the utterance has been made, otherwise false (at another spot, for instance). It would be likewise true if and only if it is raining now when it has been uttered, but false when the rain stops. Similarly, it would be again true if and only if it is raining actually from rain-clouds, for instance, not so when it is a shower of water from artificial sprinklers. It is easy to see the correspondence of these criteria with the other three mentioned by Haribhadra.

Haribhadra, in fact, goes a little further to conclude that a statement like 'It is raining' or even 'The pot exists' has both truth-values, it is both true and false, in view of the above considerations. In fact, it is better to talk in terms of truth-values (as will be clear below), rather than in terms of the contradictory pairs of predicates. For the law of contradiction, as it is usually stated in ordinary textbooks of logic, requires that the denial of a predicate, F, of a subject, a, be the same as the affirmation of the contradictory predicate of the same subject and vice versa. Besides, saying yes and no to such questions as 'Is a F?' is equivalent to assign truth and falsity respectively to the statement 'a is F'.

One may argue that discovery of the indexical elements on which the determinants of a truth-value depends, that is, of the indexical determinants for successfully applying a predicate, may not be enough to draw such a radical conclusion as the Jainas want, namely, co-presence of contradictory properties in the same locus or assigning of both truth and falsity to the

same proposition. Faced with such questions where indexical elements play an important and significant role, we may legitimately answer, 'yes and no. It depends'. However, to generalize from such evidence that the truth and falsity of all propositions suffer from this indeterminacy due to the presence of the indexical or variable elements, and further, that all propositions are therefore necessarily and omnitemporally (*sarvathā* and *sarvadā*) both true and false, may be an illicit jump. The successful application of any predicate to a thing, on this view, depends necessarily upon a variable element such that it can or cannot be applied accordingly as we can substitute one or another thing for these variable elements. These elements, which may remain hidden in a categorically asserted proposition, is sometimes called a point of view or a standpoint. It also amounts to a view which announces that all predicates are *relative* to a point of view; no predicate can be *absolutely* true of a thing or an object in the sense that it can be applied unconditionally at all times under any circumstances. Jainism in this way becomes identified with a sort of facile relativism.

If the points in the above argument are valid, then it would be a sound criticism of Jaina philosophy. However, let us focus upon two related points. First, relativism. The reflexes of relativism are unmistakable in Jainism, as they are in many modern writers. The familiar resonance of Jainism is to be found in Nelson Goodman (*The Ways of World-Making*). A typical argument is to show how the earth or the sun can be said to be both in motion and at rest depending upon the point of view. An obvious criticism of facile relativism (though not that of Goodman) is that it can be shown to be self-inconsistent, for in trying to argue that all truths are relative to some point of view or other, it makes use of an absolute notion of truth. Will this charge hold against Jainism? I do not think so. For Jainism openly admits an absolute notion of truth, which lies in the total integration of all partial or conditionally arrived at truths, and is revealed to the vision of an omniscient being such as the Mahāvīra. The emphasis here is on the conditionality and limitedness of the human power and human vision and therefore it applies to all humanly constructible positions. The concern is somewhat ethical. Rejection of a seriously held view is discouraged, lest we fail to comprehend

its significance and underlying presuppositions and assumptions. The Jainas encourage openness.

Are the Jainas guilty of illicit generalization? This is another point of the above critique. All predicates for which there is a contradictory one, are indeterminate as regards the truth and falsity of their application. In fact, by claiming that the contradictory pairs are applicable they take the *positive* way out as opposed to the Buddhists, the Mādhyamikas, who take the *negative* way. Of the familiar four Buddhist alternatives, yes, no, both, and neither, the Jainas may prefer the third, both yes and no, while the Mādhyamikas reject all four. If unconditionality and categorically of any predication, except perhaps the ultimate one, *anekānta* in this case, is denied, then this is a generalized position. The only way to counter it would be to find a counter-example, that is, an absolute, unconditionally applicable, totally unambiguous and categorically assertible predicate, or a set of such predicates, without giving in to some dogma or having some unsuspected and unrecognized presupposition. The Jainas believe that this cannot be found. Hence *anekānta*.

Haribhadra and other Jaina philosophers have argued that we do not often realize, although we implicitly believe, that application of any predicate is guided by the consideration of some particular *sense* or criterion (excessive familiarity with the criterion or sense makes it almost invisible, so to say). This is not exactly the Fregean *Sinn*. In the Indian context, there is a well-entrenched tradition of talking about the 'basis' or the 'criterion' for the application of a predicate or a term. This can be called the *nimitta* theory (the 'basis' or 'criterion' theory). A predicate can be truly applied to something *x* in virtue of a particular or a specific basis. The philosopher, when he emphasizes the particularity or specificity of such a basis, indirectly and implicitly commits himself to the possibility of denying that predicate (i.e. of applying the contradictory predicate) to the same thing, *x*, in virtue of a different basis or criterion. Haribhadra says (p. 44):

> (The Opponent says:) The lack of existence in virtue of being a watery substance, etc., belongs to a particular earth-substance, a pot;

however, this is because the locus of non-existence of something cannot be a fiction. We admit therefore that it is the particularity of the earth-substance, the pot, that excludes the possibility of its being existent as a water-substance (this does not amount to admitting the co-presence of existence and non-existence in one locus).

(The Jaina answer:) Oh, how great is the confusion! By your own words, you have stated the *anekānta*, but you do not even recognize it yourself! Existence in virtue of being an earth-substance itself specifies its non-existence in virtue of being a water-substance (you admit this). But you cannot admit that the thing has both natures, existence and non-existence. This is a strange illusion! No object (or thing) can be specified without recourse to the double nature belonging there, presence of its own existence in it, and absence from it, the existence of the other.

The general point of the Jainas seems to be this. Any predicate acts as a qualifier of the subject and also a distinguisher. That is, its application not only refers to or, in the old Millian sense, connotes, a property that is present in the subject, but also indicates another set of properties that are *not* present in it at all. In fact, insistence, that is, absolute insistence, on the presence of a property (an essential property) in a subject, lands us invariably into making a negative claim at the same time, absence of a contradictory property, or a set of contrary properties from the same subject-locus.

At this stage, the opponent might say, with some justification, that the conclusion reached after such a great deal of arguing tends to be trivial and banal. All that we have been persuaded to admit is this. Existence can be affirmed of a thing, *x*, in virtue of our fixing certain determinants in a certain way, and if the contrary or contradictory determinants are considered, existence may be denied of that very thing. This is parallel to assigning the truth-value to a proposition when all the indexical elements in it are made explicit or fixed, and being ready to accept the opposite evaluation if some of their indexicals are differently fixed or stated. Realists

or believers in bivalence (as Michael Dummett has put it) would rather have the proposition free from any ambiguities due to the indexical elements—an eternal sentence (of the kind W.V. Quine talked about) or a thought or *Gedanke* (of the Fregean kind)—such that it would have a value, truth or falsity—eternally fixed. However, the Jainas can reply the charge of banality, by putting forward the point that it is exactly such possibilities which are in doubt. In other words, they deny that we can, without impunity, talk about the possibility of clearly and intelligibly stating such propositions, such eternal sentences, or expressing such thoughts. We may assume that a proposition has an eternally fixed truth-value, but it is not absolutely clear to us what kind of a proposition would that be. For it remains open to us to discover some hidden, unsuspected determinants that would force us to withdraw our assent to it,

V

A more serious criticism of Jainism is that if the senses are changed, and if the indexicals are differently interpreted, we get a new and different proposition entirely, and hence the result would not be affirmation and denial jointly of the same proposition. If this is conceded then the main doctrine of Jainism is lost. It is not truly an *anekānta*, which requires the *mixing* of the opposite values. This critique, serious as it is, can also be answered. This will lead us to a discussion of *saptabhaṅgī*.

The philosophical motivation of the Jainas is to emphasize not only the different facets of reality, not only the different *senses* in which a proposition can be true or false, not only the different determinants which make a proposition true or false, but also the contradictory and opposite sides of the *same* reality, the dual (contradictory) evaluation of the same proposition, and the challenge that it offers to the doctrine of bi-valence realism.

Let us talk in terms of truth predicates. The standard theory is bi-valence, i.e. two possible valuations of a given proposition, true or false. The first step taken by the Jainas in this context is to argue that there may be

cases where joint application of these two predicates, true and false, would be possible. That is, given certain conditions, a proposition may be either (1) true or (2) false or (3) both true and false. If there are conditions under which it is true and there are other conditions under which it is false, then we can take both sets of these conditions together and say that given these, it is both. This does not mean, however, the rejection of the law of contradiction. If anything, this requires only non-compliance with another law of the bi-valence logic, that of the excluded middle (the excluded third). It requires that between the values true and false, there is no third alternative. The law of non-contradiction requires that a proposition and its contradictory be not true together. This keeps the possibility of their being false together open. Only the law of excluded middle can eliminate such a possibility. This is at least one of the standard interpretations of the so-called two laws of bi-valence logic. In a non-bi-valence logic, in a multiple-valued logic, the law of contradiction is not flouted, although it disregards the excluded third. The Jainas however disregard the mutual exclusion of yes and no, and argue, in addition, in favour of their combinability in answer to a given question. We have shown above how such opposite evaluations of the same proposition can be made compatible and hence combinable.

It is the sameness of the proposition or the propositional identity that is open to question here. If the change of determinants of point of view, of the indexical element, introduces a different proposition, the change of truth-values from 'true' to 'false' would not be significant enough. However, we may claim that the proposition, whatever that is, remains the same and that it has both values, 'true' and 'false', depending upon other considerations. This would still be a non-significant critique of the classical standard logic of bi-valence. The Jainas therefore go further, in order to be true to their doctrine of 'precarious' evaluation (*ākulavāda*), and posit a separate and non-composite value called '*avaktavya*' ('inexpressible'), side by side with 'true' and 'false'. I shall presently comment on the nature of this particular evaluation. First, let us note how the Jainas get their *seven* types (ways) of propositional evaluation. If we allow combinability of values, and if we have three basic evaluative predicates (truth-values?), 'true', 'false' and

'inexpressible' (corresponding to 'yes', 'no' and 'not expressible by such yes or no'), then we have seven and only seven alternatives. Writing '+', '−' and '0' for the three values respectively:

$+, −, + −, 0, 0^+, 0^−, 0^{+−}$.

For proper mathematical symmetry, we may also write:

$+, −, 0, + −, {}^+0, {}^-0, 0^{+−}$

This is following the principle of combination of three basic elements, taking one at a time, two at a time and all three. The earlier arrangement reflects the historical development of the ideas. Hence, in most texts, we find the earlier order.

The 'Inexpressible' as a truth-like predicate of a proposition has been explained as follows: It is definitely distinct from the predicate 'both true and false'. For the latter is only a combination of the first two predicates. It is yielded by the idea of the combinability of values or even predicates that are mutually contradictory. Under certain interpretations, such a combined evaluation of the proposition may be allowed without constraining our intuitive and standard understanding of a contradiction and consistency. 'It is raining' can be said to be both true and false under varying circumstances. However, the direct and unequivocal challenge to the notion of contradiction in standard logic comes when it is claimed that the same proposition is both true and false at the Same time in the same sense. This is exactly accomplished by the introduction of the third value—'Inexpressible', which can be rendered also as paradoxical. The support of such an interpretation of the 'Inexpressible' is well founded in the Jaina texts. Samantabhadra and Vidyānanda both explain the difference between the 'true and false' and the 'Inexpressible' as follows. The former consists in the *gradual* (*kramārpaṇa*) assigning of the truth-values, true and false, while the latter is joint and simultaneous ('in the same breath') assigning of such contradictory values (cf. *sahārpaṇa*). One pat suggestion is that the predicate is called 'Inexpressible' because in this case we are constrained to say both 'true' and

'false' in the same breath. Something like 'true-false' or 'yes-no' would have been better, but since these are only artificial words, and there are no natural-language-words to convey the concept that directly and unambiguously flouts non-contradiction, the Jainas have devised this new term 'Inexpressible' to do the job—a new evaluative predicate, non-composite in character, like 'true and 'false'.

This metalinguistic predicate, 'Inexpressible', has been acknowledged as a viable semantic concept in the discussion of logical and semantical paradoxes in modern times. Nowadays, some logicians even talk about 'para-consistent' logics, where a value like 'both true and false simultaneously' is acknowledged as being applicable to paradoxical propositions such as 'This sentence is false' or 'I am lying'. The third value is alternatively called 'paradoxical' or 'indeterminate' (this is to be distinguished from 'neither true nor false', which is also called 'indeterminate'; see Priest, 1979). With a little ingenuity, one can construct the matrices for Negation, Conjunction, Alternation, etc. for the system. The Jainas however do not do it.

I shall now emphasize the significant difference between the philosophical motivations of the Jainas and those modern logicians who develop multiple-valued logics or para-consistent logics. First, the logicians assign truth to the members of a certain set of propositions, falsity to another set and the third value, paradoxicality, to the problem set, i.e. the set of propositions that reveal the various versions of the liar paradox and other paradoxes. The Jainas, on the other hand, believe that each proposition, at least each meta-physical proposition, has the value 'Inexpressible' (in addition to having other values, true, false etc.). That is, there is some interpretation or some point of view, under which the given proposition would be undecidable so far as its truth or falsity is concerned, and hence could be evaluated as 'In-expressible'. Likewise, the same proposition, under another interpretation, could be evaluated 'true', and under still another interpretation, 'false'.

Second, my reference to the non-bi-valence logic or para-consistent logic, in connection with Jainism, should not be over-emphasized. I have

already noted that Jaina logicians did not develop, unlike the modern logicians, truth matrices for Negation, Conjunction, etc. It would be difficult, if not totally impossible, to find intuitive interpretations of such matrices, if one were to develop them in any case. The only point which I wanted to emphasize here, is to show that the Jaina notion of the 'Inexpressible', or notion of *anekānta* in the broader perspective, is not an unintelligible or irrational concept. Although the usual law of non-contradiction, which is by itself a very nebulous and vague concept, is flouted, the Jainas do not land us in the realm of illogic or irrationality.

Last, but not the least, the Jainas in fact set the limit to our usual understanding of the law of non-contradiction. There are so many determinants and indexicals for the successful application of any predicate that the proper and strict formulation of the ways by which this can be contradicted (or the contradictory predicate can be applied to the same subject) will always out-run the linguistic devices at our disposal. The point may be stated in another way. The notion of human rationality is not fully exhausted by our comprehension of, and the insistence upon, the law of non-contradiction. Rational understanding is possible of the Jaina position in metaphysics. In fact, one can say that the Jaina *anekānta* is a meta-metaphysical position, since it considers all metaphysical positions to be spoiled by the inherent paradoxicality of our intellect. Thus, it is a position about the metaphysical positions of other schools. It is, therefore, not surprising that they were concerned with the evaluation of propositions, with the general principle of such evaluation. In this way, their view rightly impinged upon the notions of semantics and problems with semantical paradoxes. And above all, the Jainas were non-dogmatic, although they were dogmatic about non-dogmatism. Their main argument was intended to show the multi-faceted nature of reality as well as its ever elusive character such that whatever is revealed to any observer at any given point of time and at any given place, would be only partially and conditionally right, ready to be falsified by a different revealation to a different observer at a different place and time. The Jainas think that in our theoretical search for understanding reality, this point can hardly be overstated.

Sanskrit Philosophy of Language

J. F. Staal

In memory of Louis Renou

Long before the modern languages of South Asia began to develop, a tradition of linguistic studies originated in areas of what is now India and Pakistan and what will, on account of a certain unity of traditional culture, be referred to as "India". While it is increasingly becoming known that it was in India that the science of linguistics originated and developed into an impressive tradition, India also continues to be regarded, especially in non-professional circles, as a country devoted to philosophy. An at times almost excessive preoccupation with language on the one hand, and with philosophy on the other, may indeed be regarded as a characteristic of Indian civilization. Since instances of cross-communication and cross-fertilization between these two trends have never been rare on the subcontinent, their confluence in the linguistic speculations of what could be called the Indian philosophy of language should be a rewarding subject for study. Recent research continues to justify this expectation. Because the Indian authors in this field wrote almost exclusively in Sanskrit and confined their attention to Sanskrit as the only object-language worthy of study and speculation, the philosophies of language here considered may be referred to as "Sanskrit philosophy of language".

The term "Sanskrit philosophy of language", thus loosely introduced, may still denote a variety of topics. Taking it in a rather narrow sense, it could be thought of as referring to the views of the Sanskrit grammarians, in

particular of Pāṇini's school, concerning semantics, the methodology of linguistics and the nature of language. Such views are found in some of the grammatical works, along with more specific descriptions of structures of Sanskrit. The earliest comprehensive source for discussions of this sort is Patañjali's *Mahābhāṣya* (second or first century B.C.: Renou, 1969, 489), and the most celebrated work in the grammatico-philosophical tradition which is primarily devoted to the philosophy of language is Bhartṛhari's *Vākyapadīya* (fifth century A.D.: Biardeau 1964a, 257). It may be noted that Bhartṛhari also commented on portions of the *Mahābhāṣya*, and that the *Vākyapadīya* should be understood against the background of both grammar and philosophy. There is every reason, on the other hand, to regard the *Mahābhāṣya* as an important work not only for grammar, but also for logic, methodology and philosophy (despite Frauwallner 1960, Scharfe 1961; cf. Biardeau 1964a, 31 *note*; Staal 1963c, 1967, 44–5).

The expression "Sanskrit philosophy of language" may also be taken in a wider sense and may then be thought of as referring to the various views on the nature of language put forward by Indian philosophers, whether or not directly influenced by the Sanskrit grammarians. Though almost all Indian philosophers — whether Hindu, Buddhist or Jain — devoted some attention to language, and most of the commentators evince familiarity with at least some rules of Pāṇini, language was a more or less basic topic only for the Hindu systems of Mīmāṃsā and Nyāya, and important, though not pivotal, for the Hindu Vedānta and for similar developments in Buddhism.

In the present survey, the Sanskrit philosophy of language will be taken mainly in its wider sense. The survey will not aim at comprehensiveness, for the subject is only beginning to be explored. Accordingly, some specific topics will be selected from various sources, representing the main approaches. Both before and after 1947, these approaches have been dealt with in publications primarily devoted to other topics. Monographs dealing exclusively with the philosophy of language (e.g., Chakravarti 1930 and 1933) and also articles with similar aims (e.g., Liebich 1923 and Strauss 1927) used to be rather rare. General histories of Indian philosophy touched upon these subjects under different headings, without attempting to place them in

a proper perspective. S. N. Dasgupta, author of the most comprehensive history, announced that he would treat the philosophy of grammar in a later volume (Dasgupta 1940, ix); but unfortunately he died before he could carry out this task. With particular reference to Indian semantics, Emeneau could declare in 1955: "(in India) … much was thought and written on the subject. Of this the West is for all practical linguistic purposes innocent. The Hindu treatises are in a difficult style and few in the West will be qualified to deal with them, as Sanskritists, philosophers, and linguistic scholars. Yet the results are likely to be worth the effort; it is a subject that can be recommended to aspirants" (Emeneau 1955, 151).

A few years later Tucci devoted a chapter of his history of Indian philosophy to "La parola" (Tucci 1957, 529–46). Recent years have shown a considerable increase in interest, which is undoubtedly due both to the growing importance of Western linguistics and to the interest of contemporary Western philosophy in problems of language and of linguistic analysis. Recent monographs in the field are Ruegg (1959), Sastri (1959), Bhattacharya (1962), Pandeya (1963), Kunjunni Raja (1963) and Biardeau (1964a). While some of these rarely refer to other recent contributions, others have benefited from the relatively numerous articles that appeared since Brough (1951). It must at the same time be stressed that many fundamental problems, both conceptual and historical, still await a satisfactory solution, while some topics that may turn out to be basic have hardly been touched upon.

The various approaches, theories, and doctrines that will here be referred to are interconnected in many ways. They sometimes developed side by side and are therefore not amenable to a purely chronological treatment. They will be dealt with here under the following headings: *1.* Methodological principles of the Sanskrit grammarians. *2.* Syntax and semantics at the time of the Sanskrit grammarians. *3.* Mīmāṃsā theories of language. *4.* Buddhist views on meaning and the nature of language. *5.* Bhartṛhari's philosophy of language. *6.* Vedānta and related views on language. *7.* Nyāya-Vaiśeṣika doctrines on language and the logical analysis of sentences.

1. METHODOLOGICAL PRINCIPLES OF THE SANSKRIT GRAMMARIANS

Many of the techniques of the Sanskrit grammarians are strictly confined to specific problems of grammatical description. Their use and background has been the subject of ample discussion. The key concepts appearing in these discussions have been studied in the third chapter of Renou 1940 (76–141: "Les procédés d'interprétation chez les grammairiens sanskrits"). The main terms are also explained in the grammatical dictionaries of Renou (1957) and Abhyankar (1961), and, less comprehensively, in Appendix *F* of Āpte's *Sanskrit-English dictionary* (1959, III, 77–112: "Grammatical concordance"). A detailed analysis of some methods as applied to a particular topic is given in Shefts (1961; cf. Staal 1963b). Logical methods used by Patañjali are discussed by Scharfe (1961; cf. Staal 1963c). Though a distinction ought to be made between Pāṇini's use of certain methods, Patañjali's elucidations and the later developments, this is hardly taken into account in the present survey which is confined to some of the topics with a general methodological significance. Many of these topics figured already in the *vārttikas* of Patañjali's predecessor Kātyāyana (Renou 1969, 488). They were lucidly discussed in the *Paspaśā* or Introduction to the *Mahābhāṣya*, now readily accessible in a separate annotated translation (Chatterji 1957[2]).

The most important concept of Pāṇini's grammar is that of *sūtra* 'rule'. The *Aṣṭādhyāyī* is not a catalogue of facts about Sanskrit, but a set of rules which expresses the grammatical regularities of the language. We would nowadays say that a finite number of rules is required in order to account for infinitely many expressions. Patañjali is very explicit in this respect at the beginning of the *Paspaśā* in a passage that deserves to be quoted in full: "Now if grammatical expressions (*śabda*) are taught, must this be done by the recitation of each particular word (*pada*) for the understanding of grammatical expressions — must, e.g., the grammatical expressions *gauḥ* 'cow', *aśvaḥ* 'horse', *puruṣaḥ* 'man', *hastī* 'elephant', *śakuniḥ* 'kite', *mṛgaḥ* 'deer', *brāhmaṇaḥ* be recited? No, says the author, this recitation of each particular word is not a means for the understanding of grammatical

expressions. For there is the following tradition: Bṛhaspati addressed Indra during a thousand divine years going over the grammatical expressions by speaking each particular word, and still he did not attain the end. With Bṛhaspati as the instructor, Indra as the student and a thousand divine years as the period of study, the end could not be attained, so what of the present day when he who lives a life in full lives at most a hundred years? ... Therefore the recitation of each particular word is not a means for the understanding of grammatical expressions. — But then how are grammatical expressions understood? Some work containing general and particular rules has to be composed ...".[1]

Rules were also given in the *Prātiśākhya* literature, which deals specifically with the relation between each particular Vedic *saṃhitā* ("continuous[ly recited]") text (in which the *sandhi* rules are applied) and the corresponding *pada* ("word (for word)") text (in which the *sandhi* combinations are dissolved); more generally, this literature may be said to deal with Vedic phonology. In the *Ṛkprātiśākhya* (13.31: Renou 1957, 483), itself referred to as *sūtra* (Renou 1963, 201 *note* 9), rules are referred to by means of the term *lakṣaṇa.* In grammar in general, *lakṣaṇa* is based upon *lakṣya* 'object of the rule', i.e., the object-language, since the rules must be in accordance with everyday usage (*loka*). The rules then have a general character but must conform to the empirical facts of usage.

The concepts *sūtra, lakṣaṇa/lakṣya* and *loka* have increasingly come to play a fundamental role. As for *sūtra*-rules and the elucidations they necessitate in the form of expansions (*vṛtti*), explanations (*vārttikā*), interpretations (*vyākhyāna*) and commentaries (*bhāṣya*), Renou has provided a survey which ranges from the ritual and grammatical to the legal and philosophical rules (Renou 1963). The terms *lakṣaṇa* and *lakṣya* (which in musical texts, for example, came to denote theory and practice, respectively), refer to the distinction made in Indian logic between the *definiens* and the *definiendum,* respectively (Staal 1961). For *loka* and *sarvaloka* no special study seems to be available. It is however clear from the use the earliest grammarians made of these terms, that they did not teach how Sanskrit ought to be spoken, but how it was spoken. Originally,

grammar was a descriptive, not a prescriptive science (that this changed in the course of the centuries is not surprising in view of Pāṇini's authority). That grammatical descriptions are based upon forms everybody has at his disposal is again illustrated by Patañjali in his characteristic manner: "He who wants pots goes to the shop of a potter, but he who wants words does not go to the shop of a grammarian" (Staal 1963a, 25 corresponding to 1965c, 109). Later philosophers argued from common usage (*sarvaloka*) in a similar manner as the British linguistic or "ordinary language" philosophers. Śaṅkara, for example, seeks to establish the continuity of personality against the Buddhist thesis of momentariness by explicitly invoking *sarvaloka* and applying this as follows: "we observe people saying '*I* remember to-day what *I* saw (yesterday)', but never '*I* remember to-day what *he* saw yesterday'" (*Brahmasūtrabhāṣya* 2.2.25; Staal 1966e).

What did the grammatical rules effectuate in the first place? Pāṇini's answer is: *ādeśa* "substitution". The rules can therefore, in principle, be written in the form:

$$a \rightarrow b, \tag{1}$$

where *a* denotes the substituendum (*sthānin*) and *b* the substitute (also called *ādeśa*). However, since context-restrictions have often to be taken into account, the majority of rules is written in the form:

$$c\,[a \rightarrow b]\,d \tag{2}$$

or:

$$c\,a\,d \rightarrow c\,b\,d, \tag{3}$$

where *c* and *d* need not be null (Staal 1965a cf. Cardona 1965 and Staal, 1967, 27 *note* 9). Pāṇini expresses this by using the cases meta-linguistically. The *Prātiśākhya* literature sometimes emphasized *vikāra* 'modification' or *pariṇāma* 'transformation'. For the Pāṇinīyas however, *a* does not become *b* and words do not change. This resulted in synchronic analysis, but was based upon the conviction that words are eternal (*nitya*) and not, for example, upon the methodological assumption that diachronic

analysis presupposes synchronic analysis. Accordingly, preference is given to interpretations of the form (3) as distinct from (2). In this connexion Patañjali quotes a verse: "all (substitutes) taught by Pāṇini, the son of Dākṣī, are substitutes of entire words; for if only a portion of the word were modified, the permanence of words would not be possible"[2] (Ruegg 1959, 45). Thus, words are always *siddha* 'established' and not *sādhya* 'to be established' (Biardeau 1964a, 36 and following). In this respect the rules of grammar differ from the prescriptive rules (*vidhi*) of the Mīmāṃsā (see below, *3*). They constitute in fact an exception to the general emphasis on imperatives and subjunctives, which resulted from the requirements of Vedic exegesis, and which accounts for the fact that "the linguistic thought of philosophers in India was not so largely confined to indicative propositions as that of logicians in the west" (Brough 1953, 162). The emphasis on descriptive sentences returns in the Advaita Vedānta with its descriptive and realistic stress on knowledge based upon the object that is *siddha*, as against meditation based upon prescriptive rules (*vidhi*) and referring to what is *sādhya* (Staal 1962a, 61–63).

Of the resulting grammatical problems treated by Kātyāyana and Patañjali, some were lucidly formulated by Kielhorn: "If it is admitted that the words and their meanings are fixed and settled by common usage, it may well be asked whether the rules laid down by Pāṇini are at all necessary, and it must therefore be shown that and why they are necessary" (Kielhorn 1876 = 1965[2], 49). This is answered by Kātyāyana by declaring that grammar enjoins restrictions (*dharmaniyama*), which is discussed at length in the *Paspaśā* (Thieme 1929, 29–32; cf. Biardeau 1964a, 35–6, but see J. C. Wright in *BSOAS* 29 [1966] 169). Next Patañjali, following Kātyāyana, considers the following question (in Kielhorn's words): "If it is the object of grammar to lay down rules for the correct formation of those words which people actually use, it does not seem improper to enquire whether Pāṇini, in teaching the formation of such words as would not appear to be in use, has not laid himself open to just censure" (Kielhorn ibid). Various answers are suggested, including pointed references to the fact that "the extension for the use of words is vast"[3].

Both the formulation and the use of rules raise methodological problems. In formulating rules, the grammarians use an economy criterion (*lāghava* 'simplicity') which requires that the rules be formulated in as concise a manner as possible. The following *paribhāṣā* (see below) is often quoted in this connexion: "Grammarians rejoice over the saving of the length of half a short vowel as over the birth of a son".[4] On account of this criterion, which was widely adopted also outside the grammatical tradition (e.g., Staal 1963b), Pāṇini used special abbreviations and, often as a result of this, adopted a special ordering of the rules. The order of rules is sometimes marked by headings (*adhikāra*; cf. Renou 1955, 124–6). Among the abbreviations an important place is occupied by the indicatory sounds (*anubandha*; Pāṇini called them *it*). An example is *śap*, which indicates an *a* added to the verbal root in order to derive the present stem (both *śit* "the indicatory sound *ś*" and *pit* "the indicatory sound *p*" denote specific properties) (Shefts 1961). These indicatory sounds are metalinguistic elements (they occur, says Pāṇini, in *upadeśa* 'grammatical instruction' only), just as the technical terms of grammar; they raise typographical problems when translated into another language (Staal 1963b). The *anubandha* elements must disappear before the grammatical forms are finally derived (Pāṇini 1.3.9): in forming the present stem from the root *tud-* by adding *śap* we do not wish to derive **tudśap-* but *tuda-*. The term *anubandha* may have been adopted from the ritual term *anubandhya paśu*, denoting the sacrificial victim tied to the post and subsequently slaughtered (Abhyankar 1961, 24). Patañjali discusses the question whether it has to be assumed that the word is different when its *anubandha* has disappeared: "If it is held that the *anubandha* produces something else, the answer is, No. Why? Because of elision. The *anubandha* is here elided. When the *anubandha* is here elided it (the word) does not become something else. Just as in the following case. 'Which of these two is Devadatta's house? That where the crow is.' When the crow flies away, the house is no longer marked. Likewise here, when this *anubandha* is lost, the evidence is destroyed. But even if one knows that the *anubandha* is lost, the understanding that it was marked by it remains. Just as in the following

case. 'Which of these two is Devadatta's house? That where this crow is.' When the crow flies away and even if the house is no longer marked, one knows in consequence what was indicated" (partly quoted by Scharfe 1961, 164).[5]

The economy criterion accounts for much in the structure of Pāṇini's grammar, including the order of its rules. At first sight the order seems haphazard, since the information on particular topics may be scattered all over the grammar. Attempts to change the order have been frequent (e.g., by Bhaṭṭojī Dīkṣita in the 17th century); they are bound to fail unless it is realized that the order of rules is determined by the logical structure of the grammar. The most interesting modern studies on order belong to the thirties (Buiskool 1934 = 1939, Faddegon 1936) and have since been resumed only within a more limited framework. The problem of automation with respect to Pāṇini's rules, which presupposes that problems of order have been solved, has hardly been touched upon (Fowler 1965, but see Staal 1966c).

Apart from their formulation, the rules raise important methodological problems with regard to their use. The preceding remarks have shown that the Pāṇinīyas distinguished between object-language and metalanguage. The relevant *sūtra* (1.1.68) has been discussed by Brough (1951), who has demonstrated that the Indian grammarians distinguished very clearly (for Bhartṛhari, see Biardeau 1964a, 360–4; Gray 1968, 72–4) between use and mention. In ordinary Sanskrit, a *quoted* expression is followed by the particle *iti*, i.e., English "'---'" corresponds to Sanskrit "---*iti*". The grammarians operate, for the sake of economy, with a reversal (*viparyāsa*) of ordinary usage in this respect: since the object-language is the object of grammar, expressions without *iti* refer to their *form*, and not to their meaning. An expression "quoted", i.e., followed by *iti*, on the other hand refers to its meaning (Ojihara-Renou 1960, 120–1; Staal 1965b).

The meta-language does not only consist of artificial elements, but in addition contains the metarules (*paribhāṣā*) which circumscribe how rules have to be used. A typical *paribhāṣā* discusses the relative strength of various *sūtras* or enunciates general principles regarding the order in which

sūtras have to be applied (discussion and applications: Birwé 1966, 15–18). Many *paribhāṣā* rules already occured in Pāṇini's grammar, but later more complete lists were constructed. The best known treatise dealing with metarules is Nāgojībhaṭṭa's *Paribhāṣenduśekhara* (18th century); it was translated by Kielhorn in 1868–74 and has been recently reprinted (1960; cf. Renou 1940, 12 *note* 1; 1956, 137–149; Rocher and Debels 1960). The consistency of Pāṇini's grammar follows from metarule 1.4.2, which states that in case of contradiction between two rules, the second rule prevails (this requires the rules to be ordered in a specific manner; for details see Birwé 1966, 51–63). The use made of this *paribhāṣā* proves that the Sanskrit grammarians accepted the law of non-contradiction; it was subsequently formulated and adhered to in logic and in the Advaita Vedānta. The law of non-contradiction is, however, not universally adhered to, since its validity depends on the kind of negation used in its formulation (Staal 1962a; cf. 1966a). Finally, mention may be made of the very important discovery by Pāṇini (or by earlier grammarians) of "zero" (Pāṇini 1.1.60 and following). Since zero may perform many functions, various zero-morphemes are distinguished (see, e.g., Shefts 1961, 12–3). Because the discovery of zero in mathematics is also attributed to India, and because Indian culture may be characterized by its emphasis on linguistics in the way Western culture may be characterized by its emphasis on mathematics, it is tempting to assume that the mathematical zero was discovered by scholars who were already familiar with the linguistic zero (Allen 1955). Historical evidence in this respect is, however, totally lacking, and the subject does not seem to have been given the attention it deserves.

2. SYNTAX AND SEMANTICS AT THE TIME OF THE SANSKRIT GRAMMARIANS

While, strictly speaking, semantics belongs to the subject of this survey, a few remarks may be devoted to syntax, especially since the attitude of the Sanskrit grammarians in this respect is not always adequately represented.

Moreover, syntax and semantics are very intimately connected as far as sentences are concerned. As may be seen from several passages already referred to, the Pāṇinīyas deal with words rather more frequently than with sentences. Sentences have however been subjected to linguistic scrutiny from the earliest times. In the *Bṛhaddevatā,* an old work which largely depends on the *Nirukta,* sentences are merely defined as collections of words (Kunjunni Raja 1963, 152). This inadequate definition has subsequently been refined (see below 7 and Matilal 1966). Kātyāyana defined the sentence as *ekatiṅ* 'what possesses one finite verb' (*vārttika* 10 ad 2.1.1; ed. Kielhorn 367.16), a definition that has been much debated.

It is often said that syntactical matters are not given much attention in Pāṇini's grammar. Among the exceptions mention is made of the treatment of nominal composition (cf. Staal 1966b). It is a fact that in the Mīmāṃsā, syntax is specifically dealt with (see below, 3.). But the view that Pāṇini neglected syntax is not tenable. This impression may have arisen because the Sanskrit grammarians never paid much attention to word order, an important syntactical topic in some modern Western languages (e.g., English). But this merely reflects the fact that word order in Sanskrit is free, i.e., that it performs no grammatical function (Staal, 1967, Ch. IV). The grammatical relations which are expressed in sentences are indeed quite independent of word order. These relations have been treated by Pāṇini in the rules dealing with the often described, but generally misunderstood, concept of *kāraka* (for recent contributions see, e.g., Rocher 1964a, b). The indispensability of *kāraka*-relations can only be understood if it is realized that they purport to describe the grammatical relationships which obtain between the words of a sentence — relationships which are quite different from and also independent of the arrangements of the words in a sentence. In fact, these grammatical relationships are characterized by the fact that they need not be manifest in or derivable from the order of the elements (generally: words) in their physical surface-shape. This has puzzled Western interpreters who were used to studying only the surface structure of sentences. Any deeper structure seemed to be vaguely semantic and hence suspect from a narrowly empiricist stand-point. But Pāṇini deals with just

this problem of the "deeper" connections between sentences (or other expressions) which differ from each other in surface structure (for nominal compounds, see Staal 1966b, 171–2). The sentences:

kumbhān karoti 'he makes pots' (4)

and:

(tena) kumbhāḥ kriyante 'pots are made (by him)' (5)

differ not only in inflexion, but also in subject and object. But from a semantical point of view they are related in a very simple way: they express the same meaning. There are close syntactical relationships between sentences like (4) and (5), and also between them and such noun phrases as:

kumbhānām kartṛ 'maker of pots' (6)

and such nominal compounds as:

kumbhakāraḥ 'pot-maker, potter'. (7)

The notion of *kāraka* is postulated in order to deal with the syntactical and semantical relations between expressions like (4)–(7); by introducing this notion, Pāṇini uncovered relations that are nowadays called transformational. In the above case the same *kāraka* relation, i.e., *karman*, is expressed by the object *kumbhān* of (4) (and accordingly by the accusative), by the subject *kumbhāḥ* of (5) (and accordingly by the nominative), by the "objective" genitive *kumbhānām* of (6) and by the first member *kumbha*-of (7).

Since it was generally assumed that he was only interested in surface morphology and phonology, it has not been realized that in the *kāraka* theory Pāṇini was concerned with sentence construction, i.e., with syntax and semantics or with what is nowadays called "deep structure". This conclusion can only be derived, however, if we correctly appreciate the system of *kāraka* relations (Kiparsky-Staal, 1969).

The *kāraka*-theory constitutes the most interesting part of the semantics of sentences dealt with by the Sanskrit grammarians: the analysis of the

deep structure of sentences, which is relevant to both syntax and semantics. The semantics of individual words required separate treatment; this is a matter of lexicography. Pāṇini's grammar is indeed incomplete without the lists of words to which the grammatical rules apply. Such lists were provided in the *gaṇa* 'list' enumerations, of which two types were in existence: the *paripūrṇagaṇa* or complete lists of words that come under the description of a particular rule; and the *ākṛtigaṇa*, which introduce a formal characteristic by means of which it is decided whether a given word comes under the description of a particular rule. The task of reconstructing these lists has recently been undertaken (Birwé 1961). The study of the more traditional dictionaries (*kośa, koṣa*), which had hardly been dealt with since Zachariae (1897), has recently been resumed as well (e.g., Birwé 1965, 1967). The older lexicographical works, in particular the *Nighaṇṭu* and the *Nirukta*, which primarily dealt with Vedic etymologies, have always received the attention of scholars, and continue to be treated in recent publications (e.g., Bhattacharya 1958).

While the relational concepts of subject, object, etc. are treated in the *kāraka*-theory, the major parts of speech were discussed from the *Nirukta* onwards. Its author, Yāska, mentions four parts of speech: *nāman* 'noun', *ākhyāta* 'verb', *upasarga* 'preverb' and *nipāta* 'particle' (see e.g. Brough 1952; Ruegg 1959, 24). While the followers of Gārgya adhered to the priority of the noun, the followers of Śākaṭāyana derived all nouns (or nominal stems) from verbs (or verbal roots); they were followed in this respect by the *Nirukta* and by Pāṇini (Emeneau 1955, 148 rightly emphasized that this priority is a matter of grammatical description, not of historical derivation; Ruegg 1959, 24 has misconstrued this by quoting a passage which introduces priority in a psychological sense, but this in no way affects the issue synchronic/diachronic). Nouns and verbs are defined in semantical terms by the author of the *Nirukta:* a verb is chiefly concerned with *bhāva* 'being and becoming', a noun with *sattva* 'reality' (Brough 1952, Ruegg 1959, 24, Kunjunni Raja 1957). The preverbs have independent meaning according to Gārgya, but according to Śākaṭāyana they depend on the meaning of the verb (Ruegg 1959, 25).

In conclusion we may state that semantics from the linguistic point of view has at no time been neglected: the etymological speculations regarding the Veda were in due course supplemented by the lexicological information contained in the dictionaries and by the syntactico-semantical theory of sentences summed up in the *kāraka*-theory.

In connexion with semantics some final remarks may be made about the so-called controversy of Kautsa (cf., e.g., Renou 1960, 68–75). According to Kautsa's theory the Vedic mantras were meaningless. This doctrine has a ritualist background; it does not seem to have been questioned that the recitation of mantras in the course of the ritual was effective; their meaning as ordinary utterances became redundant. The extreme form in which this thesis was defended scandalized Vedic orthodoxy; a list of counterarguments is provided, for the first time, by the *Nirukta*. These were further developed in the *Mīmāṃsāsūtra*, where Kautsa's arguments are neatly represented in the following terms (1.2.4, *sūtras* 34–8): so often the mantras appear simply absurd; they speak of things that do not exist (e.g., something with four horns, three feet, two heads and seven hands); they address inanimate objects (e.g., herbs and stones); they are self-contradictory and often redundant; there is a tradition for them to be learnt by heart, but no corresponding teaching of their meaning; etc. Accordingly the mantras have to be accepted as strictly meaningless (cf. also Staal, 1967, 24–5, 48). These arguments are then refuted by the author of the *Mīmāṃsāsūtra*. From a semantic point of view it may be observed, that Kautsa's doctrine does not concern a language that is considered meaningless, but rather a corpus of meaningless utterances.

3. MĪMĀṂSĀ THEORIES OF LANGUAGE

The philosophers of the Mīmāṃsā were primarily interested in the Vedic ritual and in its textual base, i.e., in the corpus of utterances provided by the Vedic revelation. This marks an important difference between them and the grammarians: the latter were interested in grammatical sentences, in the

first place of Sanskrit, but also, though often to a less marked extent, of the Vedic language. The distinction between sentence (*vākya*) and utterance (*uccāraṇa*) occurs in the grammatical writings as well, especially in contexts where Pāṇini's enunciations are regarded as *uccāraṇa*. It became widespread in the later logical and philosophical writings. This distinction constitutes an instance of that between type and token. This latter distinction too was recognized in logical and grammatical texts. Patañjali used it when discussing long and short phonemes in the context of his theory of *sphoṭa* (see below) (Biardeau 1964a, 368–9): "Phonemes are fixed, whether produced at high, middle or low speed. But then what causes the distinction in production? The productions are differentiated on account of the fact that the speaker enunciates more slowly or more quickly".[6]

Later such distinctions are found in various contexts and controversies. The philosopher Śaṅkara, for example, criticizes the view, that sounds cannot constitute the word since they disappear after having been pronounced, by saying: "That is not so for they are recognized as the same … Each time the individual sounds are pronounced they are recognized. For the word *cow* pronounced twice is not understood as two different words *cow*".[7]

Ever since the Mīmāṃsā system became known it has drawn the attention of Western scholars on account of some of its more philosophical speculations concerning the nature of language. The topics discussed in this connexion include the eternality of words and the question whether words denote universals or particulars, both dealt with in the *Mahābhāṣya* as well. Apart from such discussions, the Mīmāṃsā also evolved a very original theory of language, which may constitute a uniquely Indian contribution. On the basis of this theory, discussions arose regarding the problem of the relation between words and sentences. Whereas the topics first mentioned have been discussed in the past (e.g., Strauss 1927, 125–51; Jha 1942, 68–76; etc.) and continue to be dealt with in recent publications (e.g., Biardeau 1964a, 155–203), the particular Mīmāṃsā theory of language mentioned last was described in detail, practically for the first time, in Edgerton (1928, 1929), which does not appear to have later attracted the attention it deserves. The theories on the relationship between words and sentences have been

repeatedly discussed in recent publications (e.g., Sastri 1959, 172–217; Bhattacharya 1962, 158–187; Kunjunni Raja 1963, 193–213). Each of these topics requires some elucidation.

The Mīmāṃsā philosophers accepted the Veda as *apauruṣeya* 'not of human origin'; accordingly, they defended the thesis that words are eternal. This thesis is, in fact, like the problem of universals, related to the distinction between type and token. It is argued (circularly, no doubt) in its support that, if each word-utterance were distinct, the utterances could not be recognized as expressing the same word. Mere similarity between the utterances, moreover, will not do. Hearers perceive a present word-utterance as identical with a remembered one; and so the underlying word is eternal. Utterances of words are manifestations of words; they do not produce or create words. Similarly, the meaning of words is eternal, and so is the relation between words and meaning.

Patañjali devoted a long discussion to the question whether words denote particulars or universals. According to Vyāḍi (see e.g. Thieme 1956, 18), the meaning of a word is an individual thing (*dravya*). Patañjali did not accept any view as final, and this would probably be impossible at such level of generality. The terms which in this connection express universality, are *ākṛti* 'specific form', *jāti* 'class' and *sāmānya* 'common character(istic)'. These terms have been frequently discussed, with reference to various texts and systems. With regard to the *Mahābhāṣya* they were most recently studied by Biardeau (1964a, 44–61, from where the translations of the three terms above have been taken; cf. also Sreekrishna Sarma 1957; Thieme 1956, 7–8). The Mīmāṃsā philosophers rejected the view that words denote particulars and assumed that they refer to the *ākṛti* (Biardeau 1964a, 162–77). This is a natural consequence of their belief in the eternality of words. Murti (1963, xiii) has rightly observed that the theory of the eternality of words is the Indian counterpart of the doctrine of Ideas.

The Mīmāṃsā theory of language is best understood against the background of the principal objective of this system, which is to interpret the Vedic ritual from and with the help of the Vedic texts. Therefore, like Kautsa's theory and the theories of other ritualists, it is in origin not so

much a theory of language as a theory concerning the corpus of Vedic utterances. According to Mīmāṃsā (see Edgerton 1928, 1929) the core of the Veda is the collection of injunctions (*vidhi*) to perform specific ritual acts, such as sacrifice. The injunction finds verbal expression principally in an optative verb-form such as *yajeta* 'he shall sacrifice'. This form is divided into the root *yaj*(*i*) and the ending (*e*)*ta*. These two elements are not of equal importance, and yet they are intimately connected; so one must be the principal and one the subordinate element. Since it is through the ending that a word is brought into relationship with other words, the ending cannot depend on the root. In fact the reverse holds: the root depends on the ending. The ending is therefore the heart of the injunctive verb, and hence the heart of the heart of the whole Veda; it expresses what is called *bhāvanā* 'efficient-force'. On closer inspection the ending is seen to express two things: general verbality (*ākhyātatva*) and specific optativeness (*liṅtva*) (note that the term *ākhyāta* 'verb' was taken from ordinary language; for the technical notion of optative no general word was available, so that Pāṇini's artificial term *liṅ* was adopted). The former is expressed by any verbal ending, the latter by optative endings only. The two corresponding efficient-forces are *ārthī bhāvanā* 'efficient-force of the end or goal' and *śābdī bhāvanā* 'efficient-force of the word', respectively. For any verb denotes an action, whereas only the optative is prompted by the Vedic injunction. The former is subordinate to the latter, which therefore is "the ultimate of ultimates, the peg on which the whole system of Vedic duty hangs" (Edgerton 1928, 176).

Just as the optativeness expresses the principal force of the verb-form, the verb-form expresses the principal force of the sentence. Though other words may occur in a sentence, these are essentially complements to the verb, as in:

> *yajeta svargakāmaḥ* 'who desires heaven shall sacrifice'. (8)

In this sentence the *ārthī bhāvanā* has as its end *svargaḥ* 'heaven' and as its means the root-meaning of the verb *yaj*(*i*) 'sacrifice'. Accordingly (8) means:

> *yāgena svargaṃ bhāvayet* 'by sacrifice he shall effect (attain) heaven' (9)

(Edgerton 1929, 7). (Note that contemporary semantic theory is only beginning to describe or explain the semantic relationship between such sentences as (8) and (9)),

This interesting theory has many unforeseen consequences. Mention may be made of the theory of negation as applied to *vidhi* 'injunction'. This is most easily explained when formalization is resorted to (Staal 1962a, b). Let injunctions be expressed by prefixing a modal operator N (expressing optativeness) to indicative sentences written as F(x) (where F expresses verbality). This symbolism clearly represents the distinction between the two kinds of *bhāvanā*. For example, if F(a) stands for "the knot is tied", N(F(a)) will stand for "the knot should be tied" or "tie the knot!". Various negations can now be applied; for the sake of convenience, all will be expressed by means of a single negation symbol, i.e. ~. The negation of the injunction itself, which negates the optativeness and is equivalent to a prohibition (*niṣedha*), may now be written ~ N(F(a)), defined as (~ N)(F(a)) "the knot should not be tied" or "don't tie the knot": Two more negations are possible. Both are varieties of what is called *paryudāsa*, and in the first, the verb is negated: (i) N(~ F(a)), defined as N((~ F)(a)) "the knot should be untied" or "untie the knot"; in the second, the term *a* is negated: (ij) N(F(~ a)) "a not-knot should be tied", which may be interpreted as: "another knot should be tied" or "tie another knot!". The difference may be described by saying that these negations, which may be distinct in kind, are at any rate distinct in scope. Analogous distinctions are made in grammar and in logic, but since these refer mainly to indicative sentences of the form F(x), there are only two possibilities left. An interesting consequence of this theory of negation, which appears to be essentially richer than the Aristotelian theory of negation that is at the background of modern Western theories, is that the logical law of non-contradiction need not be true for each of these types of negation. It is intuitively clear that it does in fact not hold for the second *paryudāsa* negation: one knot may be tied as well as another. In the final analysis this, at first sight curious, state of affairs may be explained by observing, that the law of non-contradiction determines what *we* are used to referring to as negation (cf. Staal 1966a, Appendix).

The Mīmāṃsā theories on the semantic relationship between words and sentences have been studied from different points of view and have also attracted the attention of modern semanticists (e.g., Ziff 1960, 151–2). The two most well-known doctrines are those adhered to by the two main schools of the Mīmāṃsā: for the followers of Prabhākara Guru the meaning of a sentence arises directly from the collection of its words (*anvitābhidhāna*); accordingly words convey no meaning except in the context of a sentence. For the followers of Kumārila Bhaṭṭa, on the other hand, the meaning of a sentence arises indirectly through the retaining of the meanings of the individual words that comprise it (*abhihitānvāya*) (Kunjunni Raja 1963, 193–4). The first view is clearly in accordance with the basic Mīmāṃsā standpoint, according to which the Veda consists of injunctions which do not refer to a reality which is *siddha* 'established', but point forward to a reality which is *sādhya* 'to be established' (cf. Biardeau 1956, Introduction). In that case an injunction as a whole pertains to an end or goal, whereas there is no need for its individual words to have any particular meaning by themselves. The *anvitābhidhāna* doctrine, which could be described as an extreme form of "syncategorematicism", is directly related to the theory of *bhāvanā* or efficient-force. For in the latter theory it had been argued that endings are the principal elements of words because it is through them that words are related to each other. But this argument is valid only if the relationship between words in a sentence is more basic than the words themselves. — It is not known whether the Mīmāṃsakas related these speculations to the *kāraka*-theory, with which, as scholars writing in Sanskrit, they were undoubtedly familiar; there clearly are interesting similarities.

The followers of Prabhākara Guru elucidated their theory by drawing attention to the process by means of which the meaning of words is learned. A child who hears the sentences *gām ānaya* 'bring the cow' and *aśvam ānaya* 'bring the horse', understands in each case the meaning of the entire expression from the context or situation. Only by comparing the distribution he understands that the expression *ānaya* common to both must mean the command to bring, and that the terms *gām* and *aśvam* refer to the two

different animals (Kunjunni Raja 1963, 195–6). — It may in addition be noted that the *anvitābhidhāna* theory, which can account for the results of (verbal) meditation as easily as for the results of ritual activity, is less appropriate in a philosophical context where much attention is devoted to epistemology. For in any such theory, knowledge is expressed by declaratives which refer to established things, not to things-to-be-established. The Advaita Vedānta philosopher Śaṅkara indeed stresses that meditation depends on man, whereas knowledge depends on things. Meditation pertains to what is *sādhya*, but knowledge pertains to what is *siddha* (Staal 1962a, 62–3). Since according to him some of the Vedic utterances deal with what is *siddha* (e.g., the much discussed statement "the earth consists of seven islands"[8]), the philosophers of the Advaita Vedānta cannot accept the view that the meaning of sentences arises directly from the collection of their words; they adopt the alternative view, i.e., *abhihitānvaya* (cf. Biardeau 1956, Introduction).

It seems likely that not only the works of the Sanskrit grammarians, but also the philosophical texts of the Mīmāṃsā, when studied from a linguistic, semantic and logical point of view, will yield many more interesting theories, arguments and pieces of analysis, than may be imagined from the few doctrines referred to in this survey, or even from the relatively numerous theories that have already been made accessible in recent publications. As regards Mīmāṃsā it is more and more realized that earlier Western accounts were rather one-sided on account of the philosophical or epistemological bias of their authors. Kunjunni Raja's work, for example, shows how metaphysical presuppositions are quite irrelevant to many specific theories; Biardeau's work, on the other hand, stresses how specific doctrines may be construed as dependent on metaphysical backgrounds. It is quite obvious, in the context of this approach, that metaphysical prejudices may be Indian as well as Western.

In conclusion of this section a principle of word interpretation already mentioned by Edgerton may be briefly referred to: this principle says that, if we wish to establish the meaning of a word, the conventional, established meaning (*rūḍhi*) is stronger than the meaning based on analysis and

etymological derivation (*yoga*) (e.g., Edgerton 1928, 172–3). Later Mīmāṃsakas and logicians distinguished four classes of words in accordance with the way their meaning is determined: *yaugika* 'derivative' (e.g., *pācaka* 'cook' from *pac-* 'to cook'); *rūḍha* 'conventional' (e.g., *rathakāra*, literally 'chariot-maker', but actually used to refer to members of a particular caste); *yogarūḍha* 'both derivative and conventional' (e.g., *paṅkaja*, lit. 'what grows in the mud', but especially used to denote 'lotus'); and *yaugikarūḍha* 'either derivative or conventional' (e.g., *aśvagandhā*, either lit. 'having the smell of a horse' or used as a name for a particular plant which — as implied by this classification — does not smell like a horse) (Kunjunni Raja 1963, 59–63). These distinctions, though far from precise, are at any rate less vague than the familiar Wittgensteinian slogan that the meaning of a word lies in its use.

4. BUDDHIST VIEWS ON MEANING AND THE NATURE OF LANGUAGE

The later Mīmāṃsā doctrines owed much of their logical force and presentation, though not their content, to the theories of their Buddhist adversaries. While these later Buddhist views on language, which were expressed in Sanskrit, have been studied relatively often, the earlier Buddhist views, which will be referred to first, have only recently been treated from the point of view of the philosophy of language (Jayatilleke 1963). At first sight, these earlier views strike us as altogether different from the theories of the Hindu grammarians and Mīmāṃsakas; it should be borne in mind that this may be partly explained by the fact that the earliest Buddhist writings were not in Sanskrit, but in Pali. It should also be noted that these early Buddhist doctrines did not arise in the Hindu scholarly or sacerdotal milieu, which created the conditions under which linguistic speculation and Mīmāṃsā could develop. Some Buddhist writings in fact represent the orthodox Brahman as a *veyyākaraṇa* (Skt. *vaiyākaraṇa*) 'grammarian' (Jayatilleke 1963, 312).

The early Buddhist texts are given to classification, like many early Hindu writings, and are characterized by a fair amount of (probably religiously effective) repetition. In these early writings much attention was paid to a classification of questions. The existence of a class of meaningless questions was clearly recognized. Four types of questions are given, as in the following text: "A person is not a fit person to debate (or discuss with) if he, when asked a question does not categorically explain a question which ought to be categorically explained, does not analytically explain a question which ought to be explained analytically, does not explain with a counter-question a question which ought to be explained with a counter-question, and does not set aside a question which ought to be set aside"[2] (*Aṅguttara Nikāya* I. 197 in Jayatilleke 1963, 281). In the present context, the semantically anomalous questions mentioned last constitute the most interesting class. Examples of such questions may be taken from ordinary language, e.g. "In which direction has the fire gone?" (as distinct from "In which direction did the fire spread?") or "Is the son of a barren woman white or black?". Alternatively such questions are found in philosophy, e.g. "Are the *skandhas* (the constituents of being[10]) the same as *sattva* (the living being), or are they different?", "Does the saint exist after death?" or "What is decay and death and of whom is this decay and death?" While the question on *skandha/sattva* could be said to contain in a nutshell such works as Ryle's *Concept of mind*, the entire early Buddhist approach constitutes the origination of a kind of analysis which reminds us of British "ordinary language" philosophy. Both proceed in an essentially similar way: specific examples from ordinary language and philosophically interesting cases are discussed, but no general semantic theory is evolved.

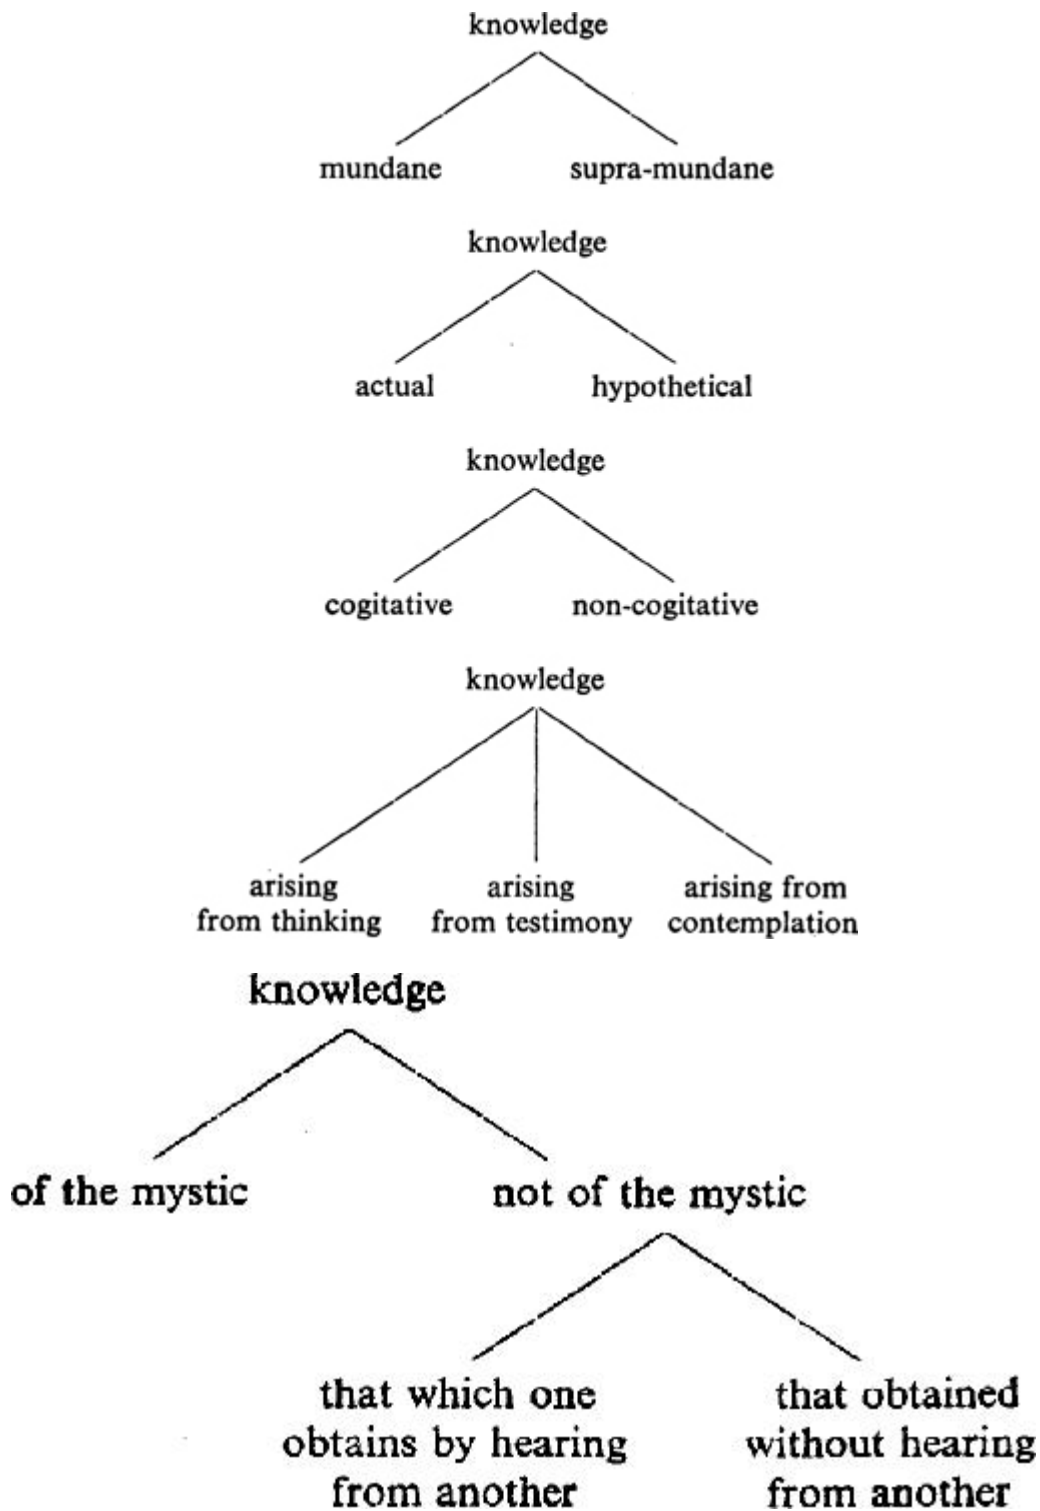
Buddhist semantics slowly developed from classifications of the meanings of terms. Many classifications were given by means of dichotomy or binary splits, but splits into three, four, etc., up to ten, are also found. Even more interesting is the fact that it was realized that this system is inadequate since it cannot account for cross-classification, i.e., for such cases as:
which contains a redundant repetition and is on a par with an alternative which also contains a redundant repetition, i.e.:
This problem was not solved, but different binary splits for the same lexical item were offered instead. Jayatilleke (1963, 302–3) gives the following examples from *Vibhaṅga* 322–4 (the original terms are here omitted):

knowledge
```
         mundane        supra-mundane
```

knowledge
```
         actual            hypothetical
```

knowledge
```
       cogitative         non-cogitative
```

knowledge
```
      arising          arising         arising from
   from thinking    from testimony    contemplation
```

knowledge
```
   of the mystic              not of the mystic
```
```
        that which one            that obtained
        obtains by hearing        without hearing
        from another              from another
```


The last tree is not described explicitly but is, according to Jayatilleke, implied. (It may be observed that these classifications in terms of trees are on a level with the semantic trees of Katz, Fodor, and Postal; only in later

work of Chomsky's they were replaced by sets in such a way that cross-classifications are accounted for.)

There was strong opposition against these early classifications, and the nominalist tendencies familiar from Buddhist philosophical literature come out clearly in an opponent's statement that "there do not exist any ideas which can be grouped together by other ideas". Jayatilleke calls this one of the earliest references to the problem of universals. The opponent's views are also expressed with reference to these classifications in terms of trees: one cannot group together ideas by means of other ideas "in the same way as two bullocks may be grouped together by a rope or a yoke" (Jayatilleke 1963, 305).

The nominalist tendency in Indian thought, which was clearly expressed in Buddhism, reacted against the realism that characterizes much of Hindu thought and against the reification that arises in Sanskrit even more easily than in many other languages. This is partly due to nominalization and to such devices of the language as the abstract forming suffixes *-tva* and *-tā* (cf. Staal 1965b). When the Buddhists came to formulate their doctrines in a clearer and more consistent way, they evolved the theory that words connote concepts or mental images (*vikalpa*) and never directly refer to a thing-in-itself.

The early positivistic schools of Buddhist philosophy, such as the Sautrāntika and the Vaibhāṣika, agreed that words are made up of sound-atoms (*śabda-paramāṇu*). According to the Sautrāntika, words are therefore material. But according to the Vaibhāṣika the Buddha's words, at least after his *parinirvāṇa*, are non-material. They held that sound alone is not capable of conveying any meaning; it must operate on something non-material, called *nāman*, in order to convey a meaning. The Sautrāntika on the other hand argue that verbal sound may convey a meaning when it is so agreed by convention (*saṅketa*). Since *saṅketa* is essential even when *nāman* is assumed, the latter is redundant and hence useless (Jaini 1959).

The later Buddhist schools evolved the theory that words connote concepts or mental images (*vikalpa*) and never directly refer to a thing-in-itself, which according to them is a momentary particular or individual

(*svalakṣaṇa*) (Kunjunni Raja 1956, 346). Thus, a theory of meaning was developed from which direct reference was systematically excluded. The meanings themselves cannot refer to momentary individuals, since otherwise there would be as many meanings as there are individuals, and language would become both infinite and superfluous. But neither can a meaning refer to a class (*jāti*), as the Mīmāṃsakas and other Hindu realists assumed: for there need not be one single thing, shared by all individuals belonging to a class (cf. Wittgenstein's "family resemblance"). Moreover if I am told to tie up a cow, I proceed to tie up a particular cow and not the class of all cows (contrast Ryle: "'dog' must denote something which we do not hear barking, namely either the set or class of all actual and imaginable dogs, or the set of canine properties ..."). A meaning, then, is only capable of *excluding* everything else. This is called *apoha* 'exclusion' or *anyāpoha* 'exclusion of everything else'. It is argued that it is immediately clear that such a doctrine is necessary. For if I were told to tie up a cow and the word "cow" failed to exclude other things, I might tie up a horse without noticing that I had failed to understand and obey the command.

The *apoha* doctrine was studied in the thirties by Frauwallner (1930–35, 1937). Apparently due to Diṅnāga (5th century A.D.), it was expounded in Dharmakīrti's *Pramāṇavārttika*. The first chapter of this work has recently been published (Gnoli 1960); the entire work has been translated into English by M. Nagatomi and will be published in the Harvard Oriental Series.

The theory that language is conventional, which may be traced back to the early Buddhist recognition that language has dialects and is subjected to change (Jayatilleke 1963, 315), continued to be adhered to by the Buddhist philosophers. Dharmakīrti links it with the *apoha* theory which implies that the meaning of a word is a conceptual construction. Language, therefore, does not picture or refer to reality. It is merely used for communication (*vyavahāra*) and for practical purposes (*arthakriyā*).

It is known that the probable originator of the *apoha* theory, Diṅnāga, held that in nominal compounds such as *nīlotpala* 'blue lotus' the term 'blue' excludes all lotuses that are not blue, and the term 'lotus' excludes all blue

things that are not lotuses. Kunjunni Raja (1963, 84–5, 191–3) has noted that this doctrine was foreshadowed by the Sanskrit grammarians, since the grammarian Vyāḍi, possibly a younger contemporary of Pāṇini, seems to have held that the meaning of a word in a compound is exclusion (*bheda*) of everything else.

5. BHARTṚHARI'S PHILOSOPHY OF LANGUAGE

A decade ago, Bhartṛhari's *Vākyapadīya*, "l'un des ouvrages difficiles de l'antiquité indienne" (Renou 1953b, 94), was difficult to obtain even in partial editions, had not been translated and had hardly been studied. At present, a considerable amount of literature is beginning to be devoted to this work, starting perhaps with Brough 1951 and including Hacker 1953 (197–205) and the monographs mentioned earlier by Ruegg, Sastri, Pandeya, Kunjunni Raja and Biardeau. The greatest need at present is for more detailed and specialized studies. The *Vākyapadīya* consists of three parts dealing with language in general (*brahman*), sentence (*vākya*) and word (*pada*). The first has been re-edited and — for the first time — translated by Biardeau (1964; cf. Gray 1968) together with the commentary by Harivṛṣabha (whom the 1935 editor Cārudeva Śāstrī identified with, but Biardeau regards as different from, Bhartṛhari himself). Of a complete translation and edition by K. A. Subramania Iyer, parts have now been published by the Deccan College Postgraduate and Research Institute (Poona). Other translations are announced from time to time. A translation made in 1957 by Śānti Bhikṣu Śāstrī exists in manuscript and a critical edition is being prepared by W. Rau (Biardeau 1964b, 21 note). Raghunātha Śarmā has also edited the first part, and written a new commentary in Sanskrit (*Ambakartrī*, Varanasi 1963).

It used to be thought, following the testimony of the Chinese pilgrim Yi-tsing, that Bhartṛhari died in A.D. 651. But since Diṅnāga quotes him, he is nowadays assigned to the fifth century. It has also been thought that Bhartṛhari was a Buddhist; he is now, notwithstanding traces of Buddhist influence, generally considered a Hindu. This may already be inferred from

the mere fact that in his metaphysical linguistics, he identifies the essence of speech (*śabda-tattva*) with the ultimate reality (*brahman*). This doctrine, called *Śabdabrahmavāda*, was further elaborated in the philosophy of *Śabdādvaita* 'non-dualism of speech'.

To describe, even in outline, the main ideas of the *Vākyapadīya* would not only require more space than is available here, but would also presuppose more research devoted to the entire work than has so far been done. Two quotations may suffice to render the flavour of the original and illustrate some of Bhartṛhari's ideas. The first deals with the problem of language learning. Bhartṛhari attributes the faculty of speech to an inborn intuition or instinct (*pratibhā*), for language is not learned. This may be compared to cases of animal instinct: "What makes the cuckoo sing in spring? What teaches the spider to weave its web, or the birds to build their nests? Who teaches beasts and birds to eat, to make love, to fight, to swim, etc., activities practised on account of heredity?"[11] (II.151–2, quoted Brough 1953, 171; Biardeau 1964a, 317; Kunjunni Raja 1963, 148).

The second passage deals with language in a wider context. The term *śabda*, generally translated as "speech" or "word" (and often capitalized to distinguish it from e.g. *pada* 'word'), is here translated as "language". Bhartṛhari says: "Those who know the tradition know that the world is a transformation of language. First this universe arose from the Veda. All proper activity in the world is supported by language. Even a child knows it on account of dispositions acquired in previous lives. The first use of the organs of speech, the setting in upward motion of breath, the striking of the places of articulation only take place when prompted by language. There is no cognition that is not accompanied by it. All knowledge appears to be permeated by language. If knowledge would go beyond its permanent linguistic form, light would not shine, reflexion being due to it. It is the foundation of all the sciences, arts and crafts. On its account all manifest things are distinguished from each other. It is the outer and inner consciousness of all transmigrating beings. In all species awareness is limited to language"[12] (I.120–6, quoted Biardeau 1964a, 317–8; cf. Ruegg 1959, 76; Murti 1963, iii).

In the *Vākyapadīya* one does not merely meet with generalities. Many problems that are more specific are treated also. Aspects of the *kāraka* theory receive a mentalistic interpretation. The cases are regarded as realizations (*sādhana*; Ruegg, misleadingly "accessoires") of the *kāraka* and their use is determined by psychological factors (*bauddhaḥ sādhanavyavahāraḥ*; Ruegg 1959, 67). — Meaning is distinguished from reference: the subject of a sentence need not refer to an external object, for in such sentences as *aṅkuro jāyate* 'the bud bursts forth (from the soil)' there is as yet no bud to refer to. In fact, the subject of a sentence is determined by *prayoga* 'usage' and *vivakṣā* 'intention (of the speaker)' (Ruegg 69). — In the process of communication, the speaker transfers his *śabda* which is without fixed succession (*akrama*), through the medium of sound which has fixed succession (*sakrama*), to the listener where it is again without succession (Ruegg 75). — Bhartṛhari clearly takes sides in the discussion on the relation between word and meaning: this relation is *nitya* 'eternal' and *svābhāvika* 'natural', not based on *samaya* 'convention' (Ruegg 73).

Bhartṛhari's fame used to be largely based on the theory of *sphoṭa*, a concept which in the past was regularly regarded as denoting a mysterious and mystical entity, akin to λόγος in the speculations of Philo Judaeus or early Christianity. The right approach to its correct interpretation has been indicated by Brough (1951), followed by Kunjunni Raja (1963). According to Brough, there is a clear difference between the concepts of *sphoṭa* in the *Mahābhāṣya* and the *Vākyapadīya* (neglected e.g. by Pandeya 1963; cf. also Biardeau 1964a, 368 *note*). Bhartṛhari distinguished between (1) the *sphoṭa* of an expression, which denotes the expression as a single unit conveying a meaning; (2) the *prākṛta-dhvani* of an expression, i.e. the phonological structure assigned to the type it represents; and (3) the *vaikṛta-dhvani*, i.e. the phonetic realization in its particular utterance-token. Various kinds of *sphoṭa* were distinguished: e.g., for *varṇa* 'phoneme'[13], *pada* 'word' and *vākya* 'sentence'. For Bhartṛhari the most important *sphoṭa* and the only one that is ultimately real, is that of the *undivided sentence*. For according to him, the *sphoṭas* of *varṇa, pada*, etc., are merely fictional (*kālpanika*) constructs of the grammarians (Brough 1951, 44). "The division (of a

sentence) into words, and their classification as verbs, nouns, and so on, as well as the subdivisions into roots and affixes, are all means for the study of language, without any absolute reality in themselves" (Kunjunni Raja 1963, 15). Or, as Bhartṛhari puts it himself: "There are no phonemes in the word, and no parts in the phonemes. The words have no separate existence apart from the sentence"[14] (I.73; cf. Biardeau 1964a, 400–20; etc.). This doctrine may be traced back to Audumbarāyaṇa, an old authority mentioned in the *Nirukta* (Brough 1952). In this context, Bhartṛhari discusses at least eight definitions of sentence which have been proposed (Ruegg 1959, 82–9; Kunjunni Raja 1964). This list was widely known, and even more than eight definitions were read into it (e.g. by Jaina philosophers). Later developments of the *sphoṭa*-doctrine are beginning to be known (see especially Joshi 1967).

The *Vākyapadīya* has also been studied in connection with the concepts of *vivarta* and *pariṇāma*, key concepts in the later development of Advaita Vedānta (Hacker 1953, 197–205; cf. Gray 1968). Bhartṛhari used both terms, but indiscriminately (e.g. I.120, quoted above); the fact that the commentator Harivṛṣabha seems to make a distinction between them may, along with other facts, indicate that he and Bhartṛhari were not the same person (Biardeau 1964b, 7–10). We have already seen that the doctrine of the eternality of words required that substitutions are considered as being applicable to entire words only (above page 503). In fact, the *Prātiśākhya* emphasis on *pariṇāma* 'transformation' and the Pāṇinīya emphasis on *ādeśa* 'substitution' may be the predecessors, respectively, of the Sāṃkhya *pariṇāmavāda* (the doctrine that the effect is a transformation of the cause) and the Advaita *vivartavāda* (the doctrine that the effect is an illusory superposition upon the cause). But Kātyāyana had already noted that even the substitution of entire words conflicts with the eternality of words: *anupapannaṃ sthānyādeśatvaṃ nityatvāt* "the replacement of an original by a substitute is impossible on account of the eternality (of words)". Thereupon the theory, perhaps implicit in the *Mahābhāṣya*, of *buddhi-vipariṇāma*, was advanced: it is not the words, but only our subjective awareness of them, that changes (Ruegg 1958, 1959; for Ruegg's criticism of Hacker cf. Staal 1960).

That Bhartṛhari does not distinguish between *vivarta* and *pariṇāma* may also be explained against the background of his ontology (Hacker 1953, 200). Regarding Bhartṛhari's ontology, much has been made of the distinction between three stages of speech, *paśyantī* 'visionary', *madhyamā* 'intermediate' and *vaikharī* (or *virāṭśabda*) 'articulated' (cf. e.g. Sastri 1959, 67–73), artificially related to a well-known verse of the Ṛgveda[15] (cf. Renou 1953a). Though these concepts are discussed in the *Vākyapadīya*, probably out of regard for the tradition, the view that they contain the entire philosophy of Bhartṛhari in a nutshell has nothing to recommend it. Biardeau speaks, in a somewhat similar vein, of *sphoṭa* as the "ontological foundation of language" (e.g., 1964a, 375). But is should not be necessary to point to metaphysics, provided semantics is recognized as a proper department of linguistic research. Bhartṛhari's philosophy is best understood as a metaphysical superstructure to a semantic theory (cf. Kunjunni Raja 1963, 146–8). The semantic theory of Bhartṛhari (who also wrote a commentary on part of the *Mahābhāṣya*, which was to be published under the editorship of the late V. S. Agrawala; cf. Renou 1969, 488, n. 20) can only be understood against the background of the Indian grammatical tradition.

6. VEDĀNTA AND RELATED VIEWS ON LANGUAGE

Though, in the context of the systems of the Vedānta, Bhartṛhari's philosophy of *śabdādvaita* could be characterized as a kind of *bhedābhedavāda* "doctrine of difference and non-difference (between the absolute and the world)" (Hacker 1953, 200), Bhartṛhari is in some respects a predecessor of the well-known Advaita philosopher Śaṅkara. Śaṅkara gives an account of *śabdādvaita* in *Brahmasūtrabhāṣya* 1.3.28 (often translated). Though he accepts the doctrine that the world originates from *śabda*, he first rejects the Mīmāṃsā view that the word is nothing but the phonemes (*varṇā eva śabdāḥ*) (held by Upavarṣa), and subsequently rejects the *sphoṭa* theory. Śaṅkara accepts that a certain number of phonemes in a fixed succession

may through continuous usage have been associated with a certain meaning. The intermediary of an entity like *sphoṭa*, then, is quite redundant: "it would be a more complicated hypothesis to assume that the phonemes, when experienced in a fixed order, manifest the *sphoṭa*, and the *sphoṭa* in its turn manifests the meaning (*artha*)".[16]

Regarding the meaning of sentences the Advaitins accept the doctrine of *abhihitānvaya* of Kumārila Bhaṭṭa (this is in accordance with their general viewpoint: *vyavahāre bhāṭṭanayaḥ* "in matters pertaining to the everyday world the Bhāṭṭa view [is authoritative]"). Some Advaitins interpreted specific doctrines of the grammarians in a purely metaphysical manner, e.g., by stating that Patañjali's view that words denote classes (*jāti*) means that all words ultimately denote the *summum genus* of pure existence (*sattā*), i.e., the absolute *brahman* (*Sarvadarśanasaṃgraha* on *Pāṇinidarśana*).

The problem of the referential capacities of language is discussed particularly in connexion with expressions referring to the absolute. Here Advaita had to reckon with an Upaniṣadic background of negative theology, stressing that the absolute is *neti neti* 'not (this) not (this)' (e.g. *Bṛhadāraṇyakopaniṣad* 2.3.6), or that it is beyond the reach of language, *yato vāco nivartante* 'that from which words return' (*Taittirīyopaniṣad* 2.4). Bhartṛhari had clearly recognized that such expressions are in no way helpful (cf. Wittgenstein): "that which is spoken of as unspeakable, as soon as it is obtained as spoken of by that unspeakability, is spoken of"[17] (III.3.20: Kunjunni Raja 1963, 254).

The Advaitins did not rest content with that but invoked the metaphorical use of language. In such expressions as *tat tvam asi* 'thou art that', which try to express the identity of the self and the absolute, the absolute "is indicated, not spoken of" (*tal lakṣyate na tū'cyate*). According to De Smet, who has studied the methods of theological interpretation used by the Advaitins with regard to such statements, the reference to the absolute is not through the primary meaning (*abhidhā*) of the word, but through its secondary meaning (*lakṣaṇā*). The secondary meaning may exclude the primary meaning (this is called *jahallakṣaṇā*), include it (*ajahallakṣaṇā*), or both include and exclude it (*jahadajahallakṣaṇā*). An example of

jahallakṣaṇā is *dvirepha*, litt. 'with two r's', a term which indicates the bee, because *bhramara* 'bee' has two r's; the primary meaning is here excluded for bees do not have r's. An example of *ajahallakṣaṇā* is *kuntāḥ praviśanti*, litt. 'the lances enter', which is also used to indicate that along with the lances the men who carry them enter. The case of *jahadajahallakṣaṇā* is the one which is appropriate in the context of definitions of the absolute (De Smet 1954, 1960; Kunjunni Raja 1963, 249–54).

The distinction between primary and secondary meaning is not confined to Advaita. On the contrary, it is very commonly met with among grammarians and philosophers, while it provides the foundation for the science of poetics (*alaṅkāraśāstra*). Patañjali had already referred to primary and secondary meanings as *mukhya* and *gauṇa*, respectively. Bhartṛhari spoke about transfer of meaning (*upacāra*). The term widely adopted in later times is *lakṣaṇā*, which may be translated as 'metaphor'. A third component, added by Ānandavardhana in the ninth century, is *dhvani* or *vyañjanā* 'suggestive power'. The perception of *dhvani* is not open to all: one has to be a connoisseur and have at one's disposal a special intuition, called *pratibhā* (the term Bhartṛhari used for the intuition which all language users need in order to grasp the meaning of a sentence) (Sastri 1959, 244–64; Pandey 1963, 693–732). The concepts of *lakṣaṇā* and *dhvani* have been described in detail by Kunjunni Raja (1963, chapters VI and VII), and are further analysed in the literature on poetics and aesthetics (e.g., De 1960, Kane 1961, Pandey 1959, 1963, Raghavan 1963, Renou 1961). But the field of Sanskrit poetics is large and cannot be done justice to in the present context.

There are many links between Sanskrit poetics and literary theory and criticism on the one hand, and some philosophies of Kashmir Śaivism on the other. The philosophical views of this school are in many respects reminiscent of Bhartṛhari (cf. e.g. Ruegg 1959, 101–16). Here it must suffice to state that Kashmir Śaivism considered its doctrine as a manifestation of the god Śiva in the medium of language (*vāk*). The universe consists of two regions: *vācya* 'to (be) spoken (of)' (cf. *signifié*) and *vācaka* 'speaking' (cf. *signifiant*). While both aspects coincide in Śiva, *vācya* corresponds to the

objective substance of the world whereas *vācaka* corresponds to conscious beings. This metaphysical dualism was on the one hand connected with traditional grammatical and semantic doctrines, but on the other hand developed into poetics and literary theory.

The later developments of the systems of the Vedānta will probably contain much material that is relevant to the philosophy of language. These developments however have not been studied from this particular point of view, and have in fact hardly received the philosophical attention they seem to deserve. There is no evidence to support the view that they contain little that is new and original; the opposite could be expected in view of the later developments of logic (in *navya-nyāya*) and of grammar (in *navya-vyākaraṇa*) (cf. Renou 1953b).

An example of an interesting passage from later Vedānta occurs in the *Pramāṇacandrikā*, a fourteenth or fifteenth century text on logic and epistemology from the Dvaita (Mādhva) school. Its unknown author advocates the view that language is learned by means of a kind of ostensive definitions and by distributional analysis: "The acquisition of meaning takes place by pointing (*nirdeśa*) accompanied by showing etc. the fingers. Thus when a child sits on the lap of its father or mother, the parent begins to draw its attention which is elsewhere to himself or to his words by showing the fingers and making a sound by snapping them, while uttering the sentences 'Child, that is your mother', 'That is your father', 'That is your brother', 'He eats the banana', etc. Then by that pointing the child learns and understands that the expressions and the expressed are related in a *general* way and that a certain combination of sounds corresponds with a certain combination of meanings. Later when hearing in different circumstances 'That is your sister', 'That is your friend', 'He is eating a cake', he begins to learn the different meanings of words by adding and removing, and so learns the *specific* relations between expressions and expressed, e.g., that the word 'mother' denotes the female parent".[18]

In this section only a few of the Vedānta doctrines concerning the philosophy of language could be illustrated. Poetics was merely touched upon. It may be noted, finally, that semantics was an important topic not

only for poetics. Some of the greatest Sanskrit poets themselves paid attention to word and meaning, as may be seen from the opening verse of Kālidāsa's *Raghuvaṃśa* (Ruegg 1959, 110): "I salute the world parents Śiva and Pārvati, united like word and meaning, in order to acquire word and meaning".[19]

7. NYAYA-VAIŚEṢIKA DOCTRINES OF LANGUAGE AND THE LOGICAL ANALYSIS OF SENTENCES

The early Nyaya-Vaiśeṣika is essentially a philosophy of *padārtha*, a term which means "a thing (*artha*) to which a word (*pada*) refers", i.e., "a referent" (Potter 1957) and which is customarily rendered as "category". As in Aristotle, the categories of language are related to the parts of speech and are at the same time regarded as categories of being. In order to determine what a category is and what it comprises, linguistic usage (*vyavahāra*) is generally invoked (Murti 1963, iii). That the categories have to be explained against the background of language was pointed out long ago by Faddegon (1918, 141–5), but since then this rather promising suggestion has not received a more detailed treatment. The relationship between the *padārtha*-system and the *kāraka*-theory also ought to be elucidated (cf. Staal 1967, 44–5).

What are the things to which words refer? The early Naiyāyikas accepted the realistic theory that words sometimes refer to individuals (*vyakti*) and sometimes to universals (*ākṛti, jāti* or *sāmānya*). Metaphorical usage (referred to by means of the term *upacāra* 'transfer') is also recognized. The later Naiyāyikas hold the view that a word refers to an individual as qualified by a class (*jāti-viśiṣṭa-vyakti*).

The Nyāya philosophers gradually came to study logical laws and rules. Some of these may be traced back to earlier rules in grammar, and in particular to the *paribhāṣā-rules*. The terms *paribhāṣā* and *nyāya* are sometimes regarded as synonyms (*Paribhāṣenduśekhara* ed. Kielhorn iv,

note). Such grammatical backgrounds have been found e.g. for the laws of contradiction and double negation (Staal 1962a) and for the law of contraposition (Staal 1962c).

During many centuries the logicians and the Mīmāṃsā philosophers have been engaged in discussions with each other and with the grammarians concerning the definition of the sentence. Starting from the naïve definition of sentence as a collection of words, or from the definition of sentence as that which possesses one finite verb (see above page 506), the Mīmāṃsakas added qualifications such as the requirement of *ākāṅkṣā* 'mutual (syntactic) expectancy'. Applying this criterion, a mere string of words ("cow horse man elephant") is not a sentence, but a "grammatical" sentence such as "he irrigates it with water", is. However, according to this criterion, "he irrigates it with fire" is also a sentence, for it is quite grammatical. Hence *ākāṅkṣā* is not a sufficient condition for a string of words to be a sentence. Another requirement was added accordingly, i.e., *yogyatā* 'semantic compatibility', which is lacking in the sentence "he irrigates it with fire". Bhattacharya (1962, 141) quotes another example of a grammatical sentence, i.e. a sentence fulfilling the condition of *ākāṅkṣā*, which does not answer this requirement, i.e. which is semantically anomalous: "There goes the barren woman's son with a chaplet of sky-flowers on his head. He has bathed himself in the waters of a mirage and is holding a bow of rabbit's horn".

As a further condition, *āsatti* or *saṃnidhi* 'contiguity' was required, which postulates that words do not constitute a sentence when they are uttered at long intervals or when they are separated by other words, even if *ākāṅkṣā* and *yogyatā* hold. Finally, the discussion was sometimes extended to *tātparya* '(speaker's) intention', but there was much difference of opinion with regard to this concept (Chatterjee 1950, 336–40; Brough 1953, 163; Kunjunni Raja 1963, 151–87).

The later Naiyāyikas held interesting theories with regard to the understanding of sentences and analysed sentences in a special way. According to them, a sentence, i.e. a string of words which possesses *ākāṅkṣā, yogyatā* and *āsatti*, generates a cognition of its meaning (*śabdabodha*) in the hearer. The semantic contents of this cognition may be

expressed by a paraphrase of the original sentence. This paraphrase is described in terms of the relation between a qualificant (*viśeṣya*) and a qualifier (*viśeṣaṇa* or *prakāra*). A complete semantic theory, at least for declarative sentences, is constructed in terms of this relation of predication (Matilal 1966).

Matilal gives the following example of the paraphrase of the sentence: *raktaṃ puṣpam* 'the flower is red'. This paraphrase represents a cognition of the qualificand "flower" qualified by the qualifier "red". All such paraphrases may be expressed by using the symbolism Q(*xy*) for "*x* which is qualified by *y*". The procedure, which is relatively uninteresting in the case of purely nominal sentences, becomes more interesting when sentences contain one finite verb. In that case the convention is adopted, that the subject expresses the qualificand. The sentence: *harir vihagam paśyati* 'Hari sees a bird' therefore receives the paraphrase: *vihaga-karmaka-darśanānukūla-kṛti-mān hariḥ* 'Hari is qualified by effort generating the activity of seeing which has a bird as its object'. This may be re-written as: "Hari is qualified by effort which is qualified by the activity of seeing which is qualified by the object bird". If *h* stands for "Hari", *k* for *kṛti*, *s* for "seeing" and *b* for "bird", this paraphrase may be represented by: *Q(hQ(kQ(sb)))*.

While the logicians held the view that the chief element of the sentence is a noun (e.g., the subject), the grammarians continued to believe that the chief element of the sentence is a verb. The old controversy between the followers of Gārgya and those of Śākaṭāyana (above page 508) re-emerges as it were in a more sophisticated form. The later grammarians considered the finite verb as the chief qualificand in their paraphrase. The sentence: *harir vihagam paśyati* would then receive the following paraphrase: *vihaga-karmaka-darśanānukūla-vyāpāro hari-kartṛkaḥ* 'the operation generating the activity of seeing which has a bird as object is qualified by Hari as its doer (i.e., is done by Hari)'.

Though these semantic theories have in their main outline been made available by Matilal (1966), it is likely that they deserve much closer study. It seems that they have been worked out in great detail, and that variations and possible counter-examples were taken into account. This was most

probably due to the continuing debates between the later logicians and grammarians.

The above survey has shown that there is no single Sanskrit philosophy of language. On the contrary, during roughly two and a half millenia a great variety of linguistic theories and speculations, and many systems of semantics were put forward and were sometimes developed in detail. The linguistic tradition of the Sanskrit grammarians remains the backbone of these developments. But the philosophers of the Mīmāṃsā, the logicians of the Nyāya (especially in later times), the Buddhists and the Jains (who have hardly been mentioned in the present account) have each contributed original and important viewpoints and investigations. While something is known with regard to each of them, much remains to be done, and it may be safely assumed that future research will yield unexpected results not only in matters of detail, but also in matters of principle. This assumption is not gratuitous, for there are many indications which show that the philosophy of language (in the sense here used) is one of those fields where India has — in bulk, variety, and depth — at least as much to offer as the West (not necessarily excluding its present-day attainments).

While all of the topics mentioned, and many that have not even been touched upon, stand in need of further elucidation, the following may perhaps be mentioned as the most important desiderata for future research. Though the content of the Prātiśākhya literature is partially known (Varma 1961², Allen 1953), their methodology requires closer study. Despite good modern studies (e.g. Shefts, Birwé 1966), Pāṇini's method requires closer and less incomplete investigation. The possibilities of formalization should also be explored. With regard to many specific but fundamental points (e.g. the *kāraka* theory), Pāṇini's treatment has been analysed only partially. From Patañjali onwards, excellent work has been done (e.g. by Kielhorn, Renou, and Thieme), but it covers only a small part of the grammatical tradition. The *Mahābhāṣya* itself has not been translated, and almost none of the later grammatical works have. With regard to Mīmāṃsā, the interesting work of Edgerton, providing detail and precision concerning one particular topic, has not been carried on. The subject in its entirety is receiving less attention

than formerly, even in India. The linguistic theories and speculations of the early Buddhists have been referred to by Jayatilleke. But the very extensive later developments, about which fairly much is now known, have hardly been studied from the particular point of view of the philosophy of language. It may however be especially interesting, as languages other than Sanskrit are involved.

Biardeau has satisfied a long felt need by providing an edition and translation of the first chapter of the *Vākyapadīya*. This is being supplemented by the work of the foremost Indian authority on Bhartṛhari, Subramania Iyer. The doctrines of Bhartṛhari have recently been treated from many points of view. But that we are only at the beginning may be inferred from the fact that there is no communis opinio (e.g. between Biardeau and Kunjunni Raja) even with regard to basic issues. Of the later grammatico-philosophical development, the *sphoṭa* doctrine has been studied by Joshi, but much else remains inaccessible. Of later Vedānta little is known, even in a purely philosophical domain; with regard to "modern" logic (*navya-nyāya*) we are in a slightly better position. But the discussions between modern logicians and modern grammarians will have to be subjected to closer scrutiny, as Matilal's investigations have shown. As regards the older Nyāya-Vaiśeṣika, its origination from a background of linguistic research should be studied. The relationships between the categories and the *kāraka*-theory of the grammarians on the one hand, and the parts of speech of Sanskrit on the other, have not received due attention. Such investigations may throw light on some purely logical and philosophical problems. The general problem, lastly, of the relations of views on the nature of language and meaning, and on philosophy in general, to the particular linguistic background of Sanskrit, is a virtually unexplored topic.

The results of recent research make it clear that future investigations will have to be carried out not only by Sanskritists, linguists, and philosophers, but also by both Western and Indian scholars; direct cooperation is even more desirable, for the subject remains a difficult one (in fact, some of the best results have been reached by Western scholars trained by Indian paṇḍits). With regard to all these investigations, Emeneau's statement of

1955 (quoted above page 500) continues to be valid: "… the results are likely to be worth the effort; it is a subject that can be recommended to aspirants".

1 *athaitasmiñ śabdopadeśe sati kiṃ śabdānāṃ pratipattau pratipadapāṭhaḥ kartavyaḥ / gaur aśvaḥ puruṣo hastī śakunir mṛgo brāhmaṇa ity evam ādayaḥ śabdāḥ paṭhitavyāḥ / nety āha / anabhyupāya eṣa śabdānāṃ pratipattau pratipadapāṭhaḥ / evaṃ hi śrūyate / bṛhaspatir indrāya divyaṃ varṣasahasraṃ pratipadoktānāṃ śabdānāṃ śabdapārāyaṇaṃ provāca nāntaṃ jagāma / bṛhaspatiś ca pravaktendraś cādhyetā divyaṃ varṣasahasram adhyayanakālo na cāntaṃ jagāma / kiṃ punar adyatve yaḥ sarvathā ciraṃ jīvati sa varṣaśataṃ jīvati … tasmād anabhyupāyaḥ śabdānāṃ pratipattau pratipadapāṭhaḥ / kathaṃ tarhīme śabdāḥ pratipattavyāḥ / kiṃcitsāmānyaviśeṣaval lakṣaṇaṃ pravartyam …* (ed. Some Indian Theories of Meaning

John Brough

IN a paper to the Society in 1951,[1] I gave some account of ancient Indian theories on the relationship between sounds and meaningful words which is summed up in the doctrine of *sphoṭa*. The present paper is intended to supplement that discussion and to indicate those aspects of Indian theory on the more general topics of meaning which I feel preserve the greatest interest for modern linguistic theory.

One of the earliest pieces of practical linguistics of which we have any record is the composition of the *pada* text of the Ṛgveda. This is an analysis of the *saṃhitā*, or connected text as uttered in recitation, into its constituent words in the form in which they would appear in isolation. This involved the resolution of the rather complicated junction-features which the connected Sanskrit sentence exhibits, and in many places the *pada* text did in fact amount to an interpretation at a time when the connected text was beginning to suffer from obscurity. Alongside this analysis of words from the sentence there was developed the study of the meanings of the words thus derived, and the results of this etymological study is summed up for us in the *Nirukta* of Yāska. It is clear that just as phonetics arose in India chiefly as a means to preserve the mode of utterance of the Vedic hymns, so the study of words and of the meanings of words was undertaken in the first place primarily to meet the needs of Vedic ritual and the text material required by it. It was thus on a basis of words and of word-meanings that the study of Vedic exegesis took shape in what was later known as the Mīmāṃsā school of philosophy. And, indeed, throughout the development of Indian linguistic thought, the relationship between word and sentence,

between the word-meaning and the sentence-meaning, remains a central problem. The Mīmāṃsā school developed elaborate canons of interpretation, and this organized body of linguistic doctrine later played an important part in the discussions of lawyers when interpreting legal injunctions, and on the other hand did much to stimulate the development of logic. In passing, one might note that the Mīmāṃsā preoccupation with the injunctions of Vedic texts with regard to religious duties was not without its effect on logical theory. The typical sentence with which they are concerned is in the imperative mood, and although later Indian logic deals largely in indicative sentences, the linguistic thought of philosophers in India was not so strictly confined to indicative propositions as that of logicians in the west. This influence can be traced in the terms *vidhi* and *pratiṣedha*, originally meaning injunction and prohibition, but in later texts occasionally used also to apply simply to positive and negative statements.

I do not propose here to give a detailed account of all the types of definitions of a sentence which occur in Indian writings ; but mention should be made of the main types. As early as the *Kātyāyana-śrauta-sūtra* the Mīmāṃsā type of definition appears, in a purely ritual manual. A sentence, it is said, is that which is *nirākānkṣam*[1]: that is to say, something which has no requirement or expectation of words outside itself to complete its meaning. It is, of course, realized that the expectancy which holds between words in the sentence is a grammatical one, since, for example, a sentence containing a pronoun requires the evidence of a neighbouring sentence to identify the pronoun. Accordingly a commentator on this passage interprets the rule which follows, *mithaŋ saṃbaddham* "it is mutually linked (with other sentences)" to mean that it may be necessary to complete the meaning of the sentence by understanding words from preceding sentences. The fact that the requirement of *ākānkṣā* is a grammatical one was not always fully understood and we find even Bhartr̥hari criticizing the Mīmāṃsā definition on the grounds that its *ākānkṣā* would imply that a passage of several grammatical "sentences" would have to be considered as one sentence.[1] Later the normal statement of the conditions for a sentence is that it must be a collection of words

possessing *ākānkṣā*, *yogyatā* and *āsatti*. In effect, however, it is only the first which is of real linguistic importance. It is the desire or requirement of an individual word or words in the sentence for others to complete the meaning, the factor which distinguishes a sentence from a string of words "cow horse man elephant". The second factor, *yogyatā*, really involves a judgment on the truth or falsity of a statement, or the sense or nonsense of a sentence. The example quoted most frequently as a breach of this condition is "He wets it with fire". Into this category also fall such logical puzzles as "the round square". The third condition, *āsatti* or *saṃnidhi*, is that the words should be contiguous in time. It is said that words uttered with the interval of a day intervening between each word cannot produce a sentence. This again is not a linguistic condition. It is of course only to be expected that the early stages of linguistic theory in India, as elsewhere, should show a certain *naïveté* and it is not surprising to find generally current in Indian philosophy, outside the writings of the professional grammarians, the idea that an individual word possesses an individual word-meaning or, in the case of nouns, that the word is the name of a thing. This view is fossilized in the regular philosophic term for thing or object, namely *padārtha*, literally "meaning of a word, that which a word means".

The two main schools of the later Mīmāṃsā were sharply opposed in their theories of the sentence. The Bhāṭṭa school on the whole seems to preserve the more primitive attitude. According to them words have in themselves meanings, and as the words are uttered in a sentence, each word performs its task of expressing its meaning, and the sentence is the summation of these meanings. The Prābhākara school, on the other hand, held the more sophisticated theory that the individual words did not express any meaning until they were united together into a sentence. This was upheld by an appeal to the method whereby a child learns its own mother tongue. They pointed out that it was by hearing sentences "fetch the cow", "fetch the horse", and so forth, that the child came gradually to understand that the animal which he saw on each several occasion was, in fact, either a cow or a horse and that the action performed by his elders was the act of fetching. These two views were named respectively *abhihitānvaya-vāda* and

anvitābhidhāna-vāda, terms which are troublesome to translate by concise English expressions. Roughly speaking, the first is the theory that the sentence is "a series of expressed word-meanings", and the second is that the sentence is "the expressed meaning of a series (of words)".

At the beginning of the second book of the *Vākyapadīya*, Bhartṛhari gives a list of definitions and quasi-definitions of a sentence. Five of these are grouped by the commentator under the traditional Mīmāṃsā designations. Thus the view that the sentence is a unified collection (*saṃghāta*) and the view that it is an ordered series (*krama*) are aspects of the *abhihitānvaya-vāda* ; while the other three belong to the *anvitābhidhāna-vāda*. These are, that the sentence is defined by a verbal expression (*ākhyāta-śabda*) or by the first word (*padam ādyam*) or by all the words taken separately with the feature of mutual requirement or expectancy superadded (*pṛthak sarvapadaṃ sākānkṣam*). All these views, of course, imply the feature of expectancy, and the first and second are to be explained with reference to this feature, since the verb or the first word is only what it is in view of its ties with the other words in its own sentence. All these theories are adversely criticized by Bhartṛhari and they need not be considered in detail here. They are none the less of some interest as evidence of very vigorous argument and debate on linguistic topics in ancient India.

All these earlier discussions on the nature of the sentence accept without question the fact that there are such things as words (*pada*), and that it is possible to attribute to these words something which can be called their meaning (*artha*). The most developed theory, namely that of the *anvitābhidhāna-vāda*, did to some extent foreshadow the later development in the grammatical schools, since it denied that the words conveyed a meaning except in the context of a sentence. Like the other views, however, this theory continued to regard the words as real and actual constituents of language. They were the units which in fact operated in linguistic communication, and since they were actually present, it merely remained for the grammarian to detect their presence by means of a grammatical analysis. The statement of procedure is quite in accordance with many

modern statements. Thus a root or suffix is analysed out on the basis of a paradigm, and complete words were recognized on the basis of substitution in sentences. It remained for the professional grammarians, of whom Bhartṛhari is the leading ancient spokesman, to draw attention to the fact that although this process of analysis could give some account of language from the formal aspect, and though it possessed a distinct value for teaching and for the explanation of texts, it was entirely inadequate as a basis for a theory of language-meaning. To Bhartṛhari and his school words were, in fact, artificial constructions of the grammarian, and looked on from the point of view of language functioning in the world, they were unreal (*asatya*).

This extraordinary relegation of words to the realm of fictions is not at all easy to grasp at first sight, and I hope I may be pardoned if I dwell at some length on this topic, since it seems to me of considerable importance for fundamental linguistic theory, and hence also for philosophy, in so far as the latter may be a "critique of language".

It is, of course, a commonplace in modern linguistics that the sentence is the primary datum. But such a statement may imply no more than an attitude comparable with the *anvitābhidhāna-vāda*. I suspect that it is the latter type of view which is often implicit in statements described as "analysis at the word level".[1] It demands something of an effort for the beginner brought up on an alphabetic system of writing to appreciate fully that a word is not a succession of letters or phonemes or segments which are then rammed together—"realized" has been a popular term in this connection. But on the contrary the word is what it is, and any account in terms of syllables, letters, phonemes, segments, prosodies, is merely an analysis, an attempt at *description* which may be more or less adequate. A similar effort, though perhaps a still more difficult one, is required to grasp the significance of Bhartṛhari's theory of the unreal nature of words. It is important to realize that this theory is not derived from *a priori* speculation, but is the result of a careful examination of what happens when we speak or listen in ordinary conversation. We do not in fact express ourselves or understand what is spoken in a series of meaning-units. After a sentence has

been understood we may look back at it, analyse it into words, and maintain that we discern words in it. But if we do so during the course of the utterance itself, we are apt to lose the meaning of the sentence. The situation is perhaps analogous to the experience which some of us had at the recent International Congress of Linguists (London, 1952) when Professor Delattre played to us records of series of synthetic vowels, each vowel being made up of two musical formants. According to the method of focusing the attention, one could hear the record either as a series of vowels or as two converging musical scales, but not as both simultaneously. The essence of the matter lies in discriminating clearly between language in operation, and language-material considered and described by a grammarian. Bhartṛhari's view is simply that words and "word-meanings" belong to the latter sphere. They constitute an apparatus (not necessarily adequate) for the description of language events, but (roughly speaking) do not themselves "exist" in the events described.

This theory of the non-reality of words not unnaturally met with strong opposition from other Indian philosophers, and Bhartṛhari provides us with a number of the arguments which they brought against it. Typical of these is the argument from our experience of sentences which contain an unknown word. If for example a townsman, who has not previously heard of the bird in question, hears the sentence, "Fetch a cuckoo from the woods," he instinctively assumes that he has not understood the sentence because he does not know the word "cuckoo"; and as the objector points out, he does know the words "Fetch … from the woods". On Bhartṛhari's view, however, a better description of the situation would be that he cannot understand the word—that is, he cannot attribute a word-meaning to it—because he has not understood the sentence. This is, at first sight, perverse and paradoxical, but if patiently considered it will be seen to have much in its favour. It follows as a corollary that the piece "Fetch … from the woods" is not the same as similar phrases which occur in other sentences, for example, "Fetch a tree from the woods"; and this situation Bhartṛhari unreservedly accepts.[1] It is of course clear that any meaning which we attribute to the fragment "Fetch … from the woods" is different in the two cases, since for example the method

of transport will be different. At the most, therefore, we can say that the apparently identical fragments in the two sentences are similar but not the same.

On this view, the distinction between "formulæ" and "free expressions" is not so clear-cut as Jespersen would have us believe.[1] Of the former category, he says, "One may indeed analyse such a formula and show that it consists of several words, but it is felt and handled as a unit, which may often mean something quite different from the meaning of the component words taken separately." But this holds also for free expressions, and as Jespersen himself realizes elsewhere,[2] the "meaning of the component words taken separately" is something which cannot be determined apart from a context; and once this is granted, the distinction between the two categories amounts to little more than this: that a word-meaning analysis is more congenial to a grammarian in the one case than in the other. The apparently objective criterion upon which Jespersen relies to diagnose a free expression, namely, substitution in sentential functions, is as we have seen explicitly rejected by Bhartṛhari as being in fact illusory.

The occurrence of homophones in a language has always provided grammarians with an interesting problem, and almost all writers on the theory of grammar have discussed the factors which enable a language to tolerate such homophones without giving rise to ambiguities. Bhartṛhari gives a list of such factors, of which the most important are *vākya*, sentence-context, and *prakaraṇa*, situational context. As a typical modern statement of the same matter I might quote Sir Alan Gardiner : "The *polysémie* of words … does not matter in the least, because the hearer always has the situation to guide him in choosing that type of meaning which is appropriate to the context."[3] This statement conveys the position roughly ; but it seems unlikely that the hearer actually chooses between the various meanings or types of meaning of the *word*—he certainly does not do so consciously in his native language; and it might be better to say that the hearer does in fact understand the sentence, and that this understanding, if afterwards utilized by the lexicographer (who also must "understand" the sentence), will enable the latter to state that, in such-and-such a situation, in such-and-such a

verbal context, etc., the given word can be extracted analytically, and such-and-such a "word-meaning" attributed to it, this word-meaning being different from other meanings of the same "word" in different contexts and different situations. Further, it is necessary to recognize that when we talk of "the word x with meaning A", "the word x with meaning B", the identification of the two x's as "one word" is a mere practical convenience for lexicography and exegesis, something which belongs not to the material but to one method of describing the material, and that this method is not necessarily the best approach to a satisfactory description of language in operation.

We are apt to say from time to time, when struggling with a difficult passage in a foreign text, that we know all the words, but that the meaning of the sentence escapes us. This however is a delusion. In such circumstances we are presumably attributing to one or more of the words a "meaning" which has not been extracted from this particular context, and the obvious comment is that we do *not* know all the words, since our knowledge does not include the manner of their occurrence in the context in question. In practice, of course, a more general, if vaguer, aura of meaning extracted from *similar* contexts frequently gives us a sufficient clue ; but this leads us in the first place to an understanding of the meaning of the sentence as a whole, and only afterwards, by an analysis of this understanding, to the attribution of meanings to the individual words.

These considerations are of the first importance for those of us who are concerned with ancient texts and hypothetical forms in Indo-European or other conjectural languages. The pursuit of the meanings of words in ancient texts is a highly skilled art, and the best work which has been done in this field has substantially added to our understanding of texts. But it is an art which requires a delicate tread. When we inquire into the meaning of a word in an ancient language we are really juggling with possible translations of sentences in which the word occurs, until we finally succeed in finding a mode of translation in which a single word or phrase of the English appears to correspond more or less to the ancient word in question. We then say that this English word or phrase is a meaning of the ancient

word. Here we at least have in the texts sentences which by one means or another we understand after a fashion; and historical and comparative studies frequently enable us to glean from texts in related languages useful hints towards this understanding—though it is important to remember that these methods can at best protect us, as a near-scientific control, against specific errors, but can never prove a positive case. When we come to the prehistory of words, however, we have no sentences at all. The only conclusion that we can reach is that it is therefore impossible to talk of the meanings of, for example, Indo-European roots, except in a very different sense of the term "meaning". Indeed the vagueness of the meanings attributed to Indo-European roots by writers on this subject is an indication of the vagueness of what is meant by meaning in this context.

Having characterized the sentence as "a single undivided utterance" which conveys a single undivided meaning, Bhartṛhari proceeds to indicate what he understands to be the nature of this sentence-meaning. One cannot claim that what he says is a definition, and indeed the theory itself really implies that definition as ordinarily understood is an impossibility. The important point is that the sentence-meaning is grasped as a unity. The situation is compared to our apprehension of a picture. This we perceive as in some sense a unity, and although we can analyse the field of vision, and say that this part of the picture is blue, this part white, and so forth, none the less, we are normally aware of the integrated whole. If on this analogy we proceed to explain the sentence on the basis of an analysis into words, we are in fact merely giving a commentary on it in what are ultimately other words, not words of the sentence itself. The idea here is closely similar to that expressed by Wittgenstein when he maintains that a proposition can only *show* what it has in common with the fact, and that this cannot be *said* in language, since any attempt to do so can only produce other propositions sharing the same logical form.[1] In the end the utmost that can be said of the meaning of a sentence according to Bhartṛhari is that it is grasped by an instantaneous flash of insight (*pratibhā*).[2] The same word is used in later times with reference to the insight of a great poet, and in such contexts may be reasonably translated as poetic genius. We are all, in fact, in a greater or

lesser degree poets in our composition of sentences and in our understanding of the utterances of our fellows. And when we have understood a sentence, we cannot explain to another the nature of this understanding.[3] Although it is an acquired faculty, understanding a language is in its operation very similar to the instinctive behaviour of animals.[4]

It is unnecessary to labour the point that the meaning of a sentence is not necessarily grasped from a knowledge of the dictionary meaning of the words. A few examples, however, may be given of the way in which sentences frequently produce an "implied" sense over and above what appears to be the literal sense. As Bhartṛhari's commentator points out, when a mother says, "The tiger eats little boys who cry," she does not in fact literally mean that there will follow an actual eating by a tiger. Rather she means what is meant by the sentence, "Don't cry."[1] Similarly, if a traveller says to his companion, "We must go, look at the sun," the meaning conveyed is not simply that of looking at the sun, but rather that the companion should realize how late in the day it is.[2] Again, in response to the command, "See that the crows do not steal the butter," not even a child is so literal-minded as to interpret it to mean that he can allow the dogs to steal the butter.[3] Examples of this sort are a direct invitation to formulate a theory on the hypothesis that a sentence can be said to have a literal meaning. This is something which in our normal linguistic discussions we are very apt to take as axiomatic; but it will be apparent after what has been said that from Bhartṛhari's point of view it is more of the nature of a postulate which we ourselves lay down as the condition for constructing specific systematic statements, as a practical convenience in handling the material. For Bhartṛhari himself, the examples quoted above were probably simply further indications of the unsatisfactory nature of a theory depending upon word-meanings. But the commentator does in fact interpret them on the basis of metaphorical transfer of meanings (*lakṣaṇā*). This was the standard interpretation in later grammatical writings, and we find for example the explanation that "crows" in the sentence quoted stands metaphorically for "crows and other animals which might steal the butter".[1]

The theory of literal and metaphorical meaning was further extended in the 9th century by Ānandavardhana in the *Dhvanyāloka*. This is primarily a treatise on poetics; but as the basis of his a æsthetic theory, the author carries out an elaborate analysis of poetic meaning. He had inherited from earlier theorists the distinction between primary and transferred or metaphorical senses of words (*abhidhā* and *lakṣaṇā*), and in addition to these he postulated a third potency of language which he called the capacity to imply or reveal a meaning other than the literal meaning (*vyanjanā*). The central term of the theory, namely *dhvani*, which has frequently been translated as suggestion, is said by Ānanda himself to be directly taken from the grammarians, though the relationship between his use of it and the use in grammar has perhaps been insufficiently clarified by modern writers. In brief, just as the sound of utterances (*dhvani* in the grammarians' sense) reveals the word (*sphoṭa*), so a poem is said to be *dhvani* when it reveals a meaning over and above the literal meaning and when the revealed or implied meaning has at the same time æsthetic value. In this theory we thus leave the more abstruse levels of philosophic linguistics, and come to more practical affairs, namely, the description and classification of meaning types as they occur in literature. Ānanda's work in fact seeks to unite the two traditions of the grammarians on the one hand and the formal rhetoricians on the other.

Ānanda's basic postulate is that utterances possess a literal meaning, and can also convey a further meaning. The scheme of classification which he adopts is fairly detailed and I can give only the outlines of it here. The main subdivision is into two types, first, the type where the literal sense is not intended (*avivakṣita-vācya*); and second, the type where the literal sense is in fact intended, but subserves the implied sense (*vivakṣitānyapara-vācya*). The first of these is again subdivided into two: the type where the literal sense is completely set aside (*atyantatiraskṛta-vācya*), and the type where the literal meaning is shifted (*arthāntarasaṃkramita-vācya*). The first of these embraces what we should normally call metaphor; but it is, so to speak, motivated metaphor, where the metaphorically used words are employed with the definite intention of conveying their associations, or

producing a striking effect. The second sub-variety is an interesting one, and covers cases where a word is used in an enhanced or diminished sense. Edgerton[1] compares this with the "emphasis" of the classical western rhetoricians, quoting Quintilian's definition; though in fact the point of view here is somewhat different. Typical examples are, "Only when favoured by the rays of the sun are lotuses *lotuses*"; "Let men continue to give the moon as a simile for her face; none the less, in the final analysis, the poor moon is the *moon*."[2]

Of much greater interest is the second main subdivision, where the literal sense is intended. The chief type here is that where poetic emotion or mood (*rasa*) is conveyed. It is of great interest to see the term *artha* "meaning", enlarged to include all that is conveyed by a poem. In accordance with the grammarians' views on the unity of the sentence-meaning, the *dhvani*-theory to a large extent operates in terms of larger unities and not individual words. At the same time it is possible from another point of view to indicate that the operative factor in producing the overtones of the implied meaning may on occasion be a single word or phrase. Thus in one example an old hunter says to a tradesman who is seeking merchandise, "How can you expect us to have elephant tusks or tiger skins, so long as my daughter-in-law wanders about the house with dishevelled hair?" Here, says Ānanda, the *dhvani* arises not from the sentence as a whole, but from the phrase "dishevelled hair", since this indicates to the hearer that the hunter's son, who ought to be out hunting, is in fact spending his time in dalliance with his newly wedded wife.[1] Similarly, when in a drama the king Udayana is told that the queen has perished in a fire, he calls to mind in his anguish her beauty: "*Those* eyes of hers glancing wildly round in terror ..." Here the word "those" heightens the emotion conveyed by the stanza and underlines for the sensitive audience the poignancy of the king's memories of very different circumstances.[2] But though it is reasonable for analysis to take account of features of this sort, Ānanda fully realizes that in other cases we must take the whole stanza, or even the whole poem, as instrumental in conveying the poetic meaning.[3]

The extant Sanskrit writings on linguistic theory and on rhetoric form a very extensive literature, and the foregoing account is necessarily a mere outline sketch of some of the most interesting aspects of the Indian theories. One important point which I should like to stress is the realization of the Sanskrit rhetoricians of the need for an explicitly formulated theory of language-meaning as a basis for a theory of poetics. Most philosophic discussions of meaning confine themselves to a relatively small portion of language behaviour, namely, statements which describe or report a state of affairs—the propositions of the natural sciences, or, more generally, such statements as are traditionally handled by logic. This part of language possesses enormous importance and prestige, and is also the least difficult to deal with in a more or less clear fashion. But its treatment frequently suffers from a forget-fulness of the fact that propositions (or the formulae of symbolic logic) are none the less language; and I would suggest that a wider linguistic understanding is most desirable, both for philosophy and for poetic theory. Of colloquial language, Wittgenstein remarks[1] that it is "a part of the human organism and not less complicated than it. The silent adjustments to understand colloquial language are enormously complicated". This is sufficient to dismiss the subject from the consideration of logic, and it is of course quite reasonable that the logician should limit his field in this way. The linguist however must include within his survey all types of language behaviour, from logic to literature. Wittgenstein's implication clearly is that logic can construct a logical language which can be understood without these "silent adjustments"; and it has frequently been claimed in modern times that the aim of logic should be the construction of syntactical rules which will prevent nonsense. I trust that the present paper will show that former hope is certainly a vain illusion, and that the latter is probably so. Logic, mathematics, linguistics, science in general, all convey their messages in language, and this language, however technical, *cannot be understood* save in a manner which is fundamentally similar to the understanding of everyday language. As the ancient Indian might say, the utterances of the costermonger, the language of the great poet, and the

formulæ of the atomic physicist are all in some sense manifestations of the same divine Vāk.

1 KSS i. 3. 2 teṣāṃ (*sc.* mantrāṇāṃ) vākyaṃ nirākānkṣam.

1 VP ii. 3 ff. The grammatical sentence is here identified on the basis of the Vārttika definition, *eka-tiŋ* "possessing one finite verb".

1 Such an analysis may be justified where the forms of words are the chief concern; but considerable contortions and an embarrassing set of fictions (e.g., the "central core of meaning" of a word) seem to be needed if we attempt to construct a descriptive statement of meaning on the basis of a word analysis. Such a wholesale rejection of word-meanings from scientific discussion does not of course mean the advocacy of the abolition of lexicography, but rather the recognition of the essentially practical and pragmatic nature of lexicographical statements of meaning.

1 The objection is raised in VP ii. 74, and answered in ii. 94. The naïve person (*mūḍha*) thinks that he perceives the same meaning in the parallel portions of the two sentences (*vanāt* pika *ānīyatām*; *vanād* vṛkṣa *ānīyatām*); but this, as the commentator remarks, is a misconception due to the serial nature (*krama-vaśāt*) of the linguistic sentence-symbol. [Thus for Bhartṛhari the naïve view is completely analogous to the suggestion that in *y* and *v*—due to the linear nature of our writing—there is a common part. Cf. also VP ii. 416: just as the letters in a word are in themselves meaningless, so also are the words (*pada*) in a sentence.] Thus the substitution of the word *pika* for *vṛkṣa* produces an entirely different sentence; and if there is doubt as to the meaning of one word, then the whole sentence is not understood (*pikādiyogāt sakalam evātyantavilakṣaṇam; ekapadārthasaṃdehe sakalam evājnātaṃ vākyam ity ucyate*).

1 *Tractatus*, 4.12–4.1212.

2 VP ii. 119, 145.

3 VP ii. 146: *idaṃ tad iti sānyeṣām anākhyeyā kathaṃcana: pratyāt-mavṛttisiddhā sā kartrāpi na nirūpyate*: "This (*pratibhā*) cannot in any way be explained to others in terms such as 'It is this'; its existence is ratified only in the individual's experience of it, and the experiencer himself cannot describe it."

4 Bhartṛhari points the analogy in a pair of verses (VP ii. 151, 152):—

svaravṛttiṃ vikurute madhau puṃskokilasya kaṃ:
jantvādayaṃ kulāyādikaraṇe kena śikṣitāṃ.
āhāraprītyabhidveṣaplavanādikriyāsu kaṃ
jātyanvayaprasiddhāsu prayoktā mṛgapakṣiṇām.

"Who alters the note of the cuckoo in spring? Who teaches the spider to weave its web? Who impels the birds and beasts in their eating and mating, in their enmities, or in their flight, and in all the other actions determined by heredity?" The commentator on the latter verse in fact uses the term *pratibhā*, where we should say "animal instinct" (*pratiprāṇyāhārādikriyā niyatānādipratibhāvaśāt*, "The

actions of animals, eating, etc., differing from one animal to another, are determined by a beginningless *pratibhā*," i.e., a *pratibhā* which is not learnt).

1 Commentary to VP ii. 322: *yathā rudantaṃ vyāghro bhakṣayatīti bālasyocyate, na tatra vyāghrabhakṣaṇaṃ vastusthityā saṃbhavi, kevalaṃ mā kadācit tvaṃ rodīr iti rodananiṣedha eva tasya kriyate …*

2 VP ii. 312.

3 VP ii. 314: *kākebhyo rakṣyatāṃ sarpir iti bālo 'pi coditaṃ: upaghātapare vākye na śvādibhyo na rakṣati.*

1 So for example Nāgeśa Bhaṭṭa, *Laghumanjūṣā*, p. 123 (*kākādi*).

1 F. Edgerton, "Indirect Suggestion in Poetry: A Hindu Theory of Literary Aesthetics," *Proc. American Philosophical Society*, lxxvi, 1936, p. 700. Edgerton seems to imply that the whole of the *avivakṣita-vācya* category could be compared with *emphasis*, though in fact only the *arthāntarasaṃkramita* type is really analogous to the first of Quintilian's two varieties of *emphasis* (*Institutio*, viii. 3, 83 ff.).

2 To bring out the idea, we can offer paraphrases such as "i.e., lotuses in the fullest sense of the word; lotuses with all the qualities of beauty which make them worth calling lotuses"; and in the second example, "i.e., *only* the moon and nothing else."

1 *Dhvanyāloka*, iii. 1, *vṛtti.*

2 Ibid. iii. 4.

3 See the discussion in the early part of book iii (summed up in iii. 2), where the types of *dhvani* are classified as arising from individual sounds (*varṇa*), words (or parts of words, suffixes), sentences, "stylistic structure" (*saṃghaṭanā*, i.e. the style measured by the incidence of compound words), or the whole poem or epic.

Reference and Existence in Nyāya and Buddhist Logic[*]

Bimal Krishna Matilal

CHRONOLOGICAL NOTES: Jñānaśrīmitra was one of the most important Buddhist philosophers in the 10th–11th century A.D. His works are collected and published under the title *Jñānaśrīmitra-nibandhāvali.* He was the teacher of Ratnakīrti, who summarized the views of his teacher in his own book. Udayana in his *Ātmatattvaviveka* mainly takes issues with Jñānaśrīmitra. Ratnakīrti is usually believed to have preceded Udayana. But I think Udayana and Ratnakīrti were contemporaries although Udayana was, perhaps, the junior contemporary. – Ed.

I. NON-REFERRING EXPRESSIONS IN LANGUAGE

Kumārila once made a very significant remark: Word or speech can generate cognition even of entities which are totally non-existent.[1] The fact that there are 'meaningful' and grammatically acceptable expressions in language which *purport* to refer to or to denote some entity or entities but which actually do not refer to anything in our world of experience, has very often proved a puzzle for philosophers and logicians. It is somewhat paradoxical to say that we refer to non-existent entities by such expressions as "the rabbit's horn", "the sky-flower" or "the son of a barren woman". All that we

have here is a class of 'meaningful' expressions which share the same substantival structure in common and possess the grammatical property of a proper name in the sense that they can be successfully used in a context where a proper name might have been used. These expressions have been called 'vacuous' or 'empty' terms. A problem arises when such a term occupies the subject position in a sentence; a problem that is both logical and epistemological.

The understanding of a substantival expression or phrase does not imply that it has a reference; in other words, understanding of its meaning precedes the knowledge of whether or not the expression actually refer to any real entity. That is why we are justified in calling such expressions 'meaningful' although they fail to refer to anything.

An unusual strain of realism pervades our ordinary language in such a way that whenever we try to refer to or express an imaginary or fictitious object we feel constrained to admit some kind of 'relative' reality for these fictions. If we are not happy about this admission, viz., that our fictions have some sort of 'relative' reality, the opponent tries to point out that we would otherwise face a logical problem which will be hard to explain away. To put it simply, it would be difficult, for example, to negate (logically) a statement whose subject is a fictitious object. The actual formulation of the antinomies of a two-valued logic will mainly concern us here. The awareness of these antinomies can be clearly discovered, as we shall see, in the writings of the Naiyāyikas and the Buddhist logicians of the 10th–11th centuries.

An initial note on the source material used in my discussion is in order. The Nyāya position as expounded here is mainly that of Udayana. The Buddhist position is that which Udayana regarded as the view of his Buddhist opponent. The idea of momentariness of all entities apparently belongs to the Sautrāntika school of Buddhism. Unfortunately no extant philosophical text of the Sautrāntika school where this problem is discussed is available to us. But a good account of the thesis of momentariness has been presented by Dharmakīrti and his followers. Udayana becomes involved in the argument concerning the status of empty terms while he is repudiating the logical proofs of the thesis of momentariness. In the first

chapter of his *Ātmatattvaviveka* (from which I have largely drawn my material), Udayana is mainly concerned with the Buddhist views as set forth by Jñānaśrīmitra in his *Nibandhāvali.*

II. THE RIDDLE OF 'NON-BEING'

The Nyāya school claims that a sentence whose subject term does not refer to anything stands in need of some philosophic paraphrasing. A sentence is a representation of some cognitive state. A cognitive state, i.e., a judgmental one, usually attributes a property to a subject or qualificand. And this attributable property can be called a qualifier. Now, a cognitive judgment fails if it lacks a subject to which it can attribute some property. Hence, a sentence which apparently has a non-referring expression as its grammatical subject undergoes a philosophical paraphrasing in the Nyāya system so that it can properly represent some judgmental (or qualificative) cognitive state. A judgmental cognitive state may be erroneous where the representing sentence will be regarded as false. If a cognitive judgment is right, the corresponding sentence will be true. Thus, knowledge and error are the epistemic counterparts of the truth and falsity of the sentences that express the corresponding cognitive states. Proceeding along this line, the Nyāya realism almost pre-judged the issue and tried to show that a sentence with a non-referring expression as its subject should be traced back to some kind of erroneous cognitive state and should be explained accordingly. In other words, Nyāya ruled that these sentences were demonstrably false. Bertrand Russell seems to have tried to analyse such sentences in much the same way. It has been shown by him that these sentences can be paraphrased into such logical forms as will make them patently false.[2]

Apart from this apparent similarity, the philosophic motivation of Russell was, perhaps, not very different from that of the Nyāya school. Among other things, Russell was worried about ontology. Thus, he wrote

> It is argued, e.g., by Meinong, that we can speak about 'the golden mountain', 'the round square', and so on; we can make true

propositions of which these are subjects; hence they must have some kind of logical being, since otherwise the propositions in which they occur would be meaningless. In such theories, it seems to me, there is a failure of that feeling for reality which ought to be preserved even in the most abstract studies.[3]

Whether Meinong did actually postulate such a theory or not can be determined from his doctrine of the independence of what he calls *Sosein* from *Sein*.[4] Roughly speaking, Meinong contended, arguing for a very broad sense of the term 'object', that the object's having some property or characteristic is not affected by its being existent or non-existent. Thus, although the round square does not exist because it cannot exist, it is possible to make true assertions about it or to predicate some property of it. In other words, we might truly say, "The round square is round and square." Even at the risk of a paradox, Meinong adds, one can very well say, "There are objects of which it is true to say that there are no such objects." To the criticism that the law of contradiction would be violated if the sentence "The round square is round and square" is held to be true, Meinong replied by saying that the law of contradiction holds only of what exists, or is real, and is thus not violated by the sentence in question.

Even if we leave Meinong aside, we can conceive, following Quine[5], of some fictitious philosopher like McX or Wyman, who would be willing to countenance at least subsistence, if not existence, to such entities as "the golden mountain". In other words, these philosophers would posit a world of 'unactualized possibles', but would resort to the doctrine of meaninglessness when faced with such self-contradictory expressions as 'the round square' or 'the son of a barren woman'.

Part of the difficulty connected with sentences with non-referring expressions as their subject terms can be transformed into a logical riddle. This riddle has a long history in the West and it is usually nicknamed *Plato's beard.* In India the story is more or less the same. The riddle of 'non-being' in some form or other stayed alive in the controversies between the Buddhists and the Nyāya philosophers down the centuries.

III. THE STATUS OF 'EXAMPLE' IN INDIAN LOGIC

I shall explain presently the Indian version of the riddle of non-being following Udayana.[6] Some acquaintance with the development of Indian logic during the time of Jñānaśrīmitra and Udayana is necessary for understanding the Indian version. The Buddhist believes that the logical demonstration of the proof of his thesis (viz., everything that exists is momentary) is possible. Thus, he tries to formulate a philosophic argument in the standard logical form which is mainly non-deductive. Unfortunately, modern interpreters have sometimes tried to reduce the argument into a deductive inference.

A few remarks about the nature of Indian logic may be in order here. Logic developed in India out of two slightly distinct traditions: (1) *vāda* tradition, i.e., tradition of debate which was concerned with dialectical tricks, eristic arguments and sophistry, (2) *pramāṇa* tradition, which was concerned with the criteria of empirical knowledge, the accredited source of knowledge. On account of this genesis, Indian logic imbibed an epistemological character which was never removed throughout the history.

The model of reasoning with which the Indian logicians were chiefly concerned was not *purely* deductive. Modern interpreters of Indian logic have seldom realized this point (for such oversight, see Randle, 1930). As a result there have been some confusing and futile attempts to reduce the arguments studied by the Indian logicians to Aristotelian syllogistic model. It should be noted that inspite of the neatness, elegance and precision of a deductive system like that of Aristotle, it is undeniable that a good deal of our actual reasonings may not follow the deductive pattern. The reasoning of an experimental scientist, a historian or an ordinary man trying to ascertain the truth of a particular matter, is a reasoning from what we may call 'evidence' to what we can call 'conclusion'. Even most of our philosophical arguments, where we try to depend more or less upon empirical evidences, belongs to this type of inference. A purely deductive model is not always appropriate to this kind of reasoning.

In a deductive reasoning, the so-called premises *entail* (in some acceptable sense of this term) the conclusion in such a way that if we accept the premise we cannot afford to avoid the conclusion without the risk of contradicting ourselves. In a non-deductive argument, the conclusion is not *entailed* in the same sense by the premises. We should better say that our evidences or 'premises' here justify or support the conclusion. Evidences may be good or bad, and the corresponding argument may be sound or unsound. Thus, it seems to be better to talk in terms of soundness and unsoundness of this type of arguments (instead of talking in terms of their validity or invalidity).

The general form of the arguments studied by the Indian logicians is: *A* is *B* because of *C*. The middle term or the 'reason' *hetu C* can be either adequate or inadequate (instead of being strictly valid or invalid). An adequate middle term or 'reason' will establish the conclusion and the argument will be sound. If the middle term is not adequate, the conclusion will not be established and the argument will be unsound. Ordinary conversation and philosophical treatises provide millions of examples of this kind of argument.

In a non-deductive inference, e.g., "It must have rained *because* the ground is wet", the second part is believed to be the *adequate* ground for accepting the first. And most Indian logicians tried to frame the rules of logic from the paradigm cases of sound inference of this kind. But the neatness of a deductive system can easily capture our mind. We may thus be tempted to introduce an additional premise so that these arguments will be deductively valid. We can resort to the theory of 'suppressed premises' and decide that we are dealing in fact with deductive arguments in all these cases. But this seems at best to be a distortion and at worst the demolition of the original structure of the actual argument. That we are inclined to reduce these arguments to deductive arguments proves that we are somehow assured of the *soundness* of these arguments much in the same way we feel secure about a deductively valid conclusion. But this reduction, even if it is sometimes justified, throws very little light upon the original problem, e.g., how can we reasonably draw, as we obviously do, conclusions from so-

called premises which do not strictly entail them? We merely direct our attention to a slightly different and a bit narrower question: How do we establish general propositions such as these 'suppressed" premises? Most of these premises are not admittedly necessary propositions, i.e., analytic judgments. They are in some sense 'synthetic' propositions representing general beliefs which come from common experience.[7] The early history of Indian logic seems to have been a search for an adequate model which will explain both deductive and non-deductive, empirical, inferences.

That it is often misleading to introduce a 'suppressed' general premise in some cases can be easily shown by applying the same method to a dubious case, i.e., an unsound non-deductive argument: speech sound is permanent because it is audible (5th type in Diṅnāga's table of 'reasons'; cf. his *Hetucakraḍamaru*). Should we construe this case as having a general premise "Everything that is audible is permanent", and thus treat the argument as deductively valid with a false conclusion from a false premise? Or, should we construe our general premise as "Nothing that is audible is permanent", and thus make the argument deductively invalid? The truth is that in either case we are turning our attention from the actual structure of the argument to our experience and general belief. In fact we prejudge the case seeing that the conclusion is definitely false.

The best thing would of course be to do neither. The Indian logician says that you cannot state your general premise or the universal proposition unless you can cite a supporting 'example' (*dṛṣṭānta*). A supporting 'example' can be of two types: an 'agreeing example' (*sādharmya-dṛṣṭānta*) and a 'disagreeing example' (*vaidharmya-dṛṣṭānta*). An 'agreeing' example is a case where both the 'reason' and the 'inferable property' (*hetu* and *sādhya*, comparable to Aristotle's middle term and major term respectively) are present together. This will at least show that neither the 'reason' nor the 'inferable property' can be fictitious. A 'disagreeing' example is a case where both the reason and the inferable property are absent.

With this prelude we can proceed to the heart of the controversy between the Buddhist and the Nyāya logicians. The thesis of momentariness which the Buddhist wants to prove is a universal proposition:

Whatever exists is momentary.

Its contrapositive version is:

Whatever is non-momentary does not exist.

The 'reason' in this case is 'existence', and the 'inferable property' is 'momentariness'. Now, to prove the invariable connection between the 'reason' and the 'inferable property', the Buddhist logician must cite, in the first place, some 'agreeing' example where the two properties (the 'reason' and the 'inferable property') and their connection are instantiated. But the 'agreeing' example will not be enough unless one can support it by the citation of what is called a 'disagreeing' example. A 'disagreeing example' is something that instantiates the contraposed version of the main thesis. According to the acceptable form of demonstration, the Buddhist, in order to prove his thesis, must cite not only an 'agreeing example' but also a 'disagreeing example' for making his argument sound and more convincing.

Although the proof here consists in the citation of a 'disagreeing example', the conclusion should not be regarded in any way unsound or uncertain. The whole point of citing a 'disagreeing example' is to show the actual absence of any counterexample. If a counterexample can be found where the 'reason' is present but not the inferable property, then the supposed thesis is immediately falsified. Thus, the soundness of the conclusion depends upon this absence of any counterexample, or our failure to discover any counterexample.

Now, a difficulty arises when we try to find a 'disagreeing example' for the above thesis (viz., an instantiation of the contraposed version given above). To cite an example of unreality would be in some sense to contradict one's own position because it would be like saying that there is an example (or, an entity, if we like) which, according to us, is unreal, i.e., non-existent or a non-example. An 'example', or what is called a *dṛṣṭānta* in Indian logic, must be a well-established case admitted by both sides in a philosophic debate, the opponent and the proponent. It is implied here that there is admittedly an accredited source or 'means of knowledge' (*pramāṇa*) with

which we can establish the example. Thus, an example can never be an unreal entity. This will finally lead, according to Nyāya, to the destruction of the Buddhist claim that he can prove 'logically' the momentariness of everything.

IV. THE NYĀYA-BUDDHIST CONTROVERSY

It should be made clear at this point that neither the Nyāya nor the Buddhist wishes to countenance the world of strange entities like the golden mountain or the rabbit's horn. But the difference lies in their method of approach to the problem.

Confronted with the Nyāya criticism (noted in the last section), the Buddhist does not so easily give up his hope of proving his thesis of momentariness. He tries to point out that the position of the opponent, i.e., the Nyāya position, also involves a self-contradiction. By saying that an unreal entity cannot be used as an example, or, cannot be used as the subject of a proposition, the Nyāya actually mentions 'an unreal entity' in his speech-act. And this can be shown to imply a proposition whose subject would be an unreal entity or a non-existent fiction. Thus, for example, Nyāya would have to argue: the rabbit's horn is a non-example because it does not exist. And this will contradict the original Nyāya position that fictitious entity cannot be the subject of a proposition. Thus, the Buddhist claims to have proved his thesis of momentariness even at the risk of an implicit contradiction because otherwise the rejection or criticism of his argument would lead the opponent into a patent self-contradiction.

Udayana remarks here as follows:[8] The Buddhist wants to avoid a patent self-contradiction (like saying "the rabbit's horn cannot be the subject of any proposition because it does not exist") and thus allows that certain speech-acts, and consequently certain sentences, about fictitious entities like the rabbit's horn are quite in order. The Buddhist, in fact, does not want to accept the Nyāya position that the subject term of a sentence must refer to something actual (or real), and if it does not, the whole sentence stands in

need of some philosophic paraphrasing. Thus, for the Buddhist, "The rabbit's horn is sharp" is a normal sentence which we may use in our discourse for various purposes. One of such uses is made when we cite an example of a non-entity, viz.,

"The rabbit's horn is non-momentary and also non-existent."

Nyāya, on the other hand, wants to exclude from logical discourses any sentence which will ascribe some property (positive or negative) to a fictitious entity. Vācaspati remarks that we can neither affirm nor deny anything of the fictitious entity, the rabbit's horn.[9] Thus, Nyāya apparently agrees to settle for a 'superficial' self-contradiction because, in formulating the principle that nothing can be affirmed or denied of a fictitious entity like the rabbit's horn, Nyāya in fact is violating the same principle. Nyāya feels that this 'superficial' self-contradiction is less objectionable because it can somehow be explained away while the Buddhist approach to the problem is deplorable because it will eventually lead us to reject any discrimination between actual and fictitious entities.

To simplify the matter for discussion, we might talk in terms of exemplified and unexemplified properties (borrowing the terms of Carnap with suitable modifications[10]) instead of talking in terms of referring or non-referring expressions. A referring expression, be it a name or a description, can be said to signify a property (in a broader sense) which is exemplified by the individual it names or the individual that answers the description. A non-referring expression signifies a property, or rather a complex of properties, which is not so exemplified. An unexemplified property (or, property-complex) may be also called an *empty* property (the term being borrowed from Carnap).

The Buddhist argues that it is possible to talk about fictitious objects or empty properties because, otherwise, one cannot even deny successfully their existence. Thus, it is in order when we purport to attribute empty properties to fictitious individuals or when we use a fictitious individual as a 'disagreeing example' or even as the subject of some negative proposition. A

putative answer to 'the riddle of non-being' can be given as follows: an utterance like

"The rabbit's horn does not exist"

is perfectly all right because we are only denying existence or 'actuality' to a fictitious entity. Similarly, the utterance

"The rabbit's horn is not sharp"

is also in order because here we simply refuse to attribute a property, viz., sharpness, to a fictitious object. One may also add that the correctness or soundness of these utterances can be authenticated by our accredited means of knowledge (*pramāṇa*). We can neither perceive the rabbit's horn, nor test its sharpness by direct perception, nor even can we infer its sharpness on any logical grounds (such as knowing that it cuts hard objects easily).

But if we accept empty subject terms in order to make the denial of existence to fictitious entities successful we will invite other logical problems. Udayana points out that if the negative sentence

"The rabbit's horn is not sharp"

is held to be true because it is authenticated by our accredited means of knowledge then the affirmative sentence

"The rabbit's horn is sharp"

can be argued to be true also on similar grounds. Since the rabbit's horn cannot be known through any means, no one can establish that it is not sharp. As long as it is not established that it is not sharp our claim that it is sharp should also hold.

Udayana notes

If nobody has ever seen or known a person called 'Devadatta' anywhere at any time, then the question "Is Devadatta white, or is he black?" results simply from some outrageous perversion. And if, without caring to understand what this is all about, someone

answers the question by saying "he is white" another person has as much right to answer by saying "he is black." Nothing is established by such questions and answers. In each case, the lack of our means of knowledge (to establish the subject term) and (the consequent possibility of) self-contradiction remain the same.[11]

The point that the Nyāya tries to make through this criticism is this. If we allow statements about fictitious entities in a logical discourse – statements by which we purport to attribute some property (positive or negative) to the fictitious entity – we will have no way of deciding whether they are true or false, for it will never be possible to experience the fictitious entity through any accredited means of knowledge. But the Buddhist argues that we do utter statements about fictitious entities. We tell fictitious stories, and we can conceive of unreal entities like the rabbit's horn or the hair of a turtle. It is not always the case that we have to *know* a thing before we may make statements about it or attribute some property to it. A simple cognition, an error, a conceptual construction, or even a deliberate attempt at fiction, will be enough to justify our speech-acts about fictitious entities. And statements about fictitious entities like the rabbit's horn may also serve some useful purpose in a logical discourse.

In fact the Buddhist proposes a kind of pan-fictional approach to the world of phenomena. Thus he believes that language creates fictions and the cognitive element in language can very well be the cognition of a fiction. In other words, an unreal entity can be as much the object of a cognitive state (i.e., an erroneous cognitive state) as it can be expressed by some non-referring expression in language.

V. THE EPISTEMOLOGICAL SIGNIFICANCE OF THE CONTROVERSY

Let us consider

A "The rabbit's horn is sharp."

Nyāya says that here the subject term itself can be treated as a complex term, in fact, a 'disguised' sentence, in which we are attributing either the property of having horns to a rabbit, or the property of belonging to a rabbit to the horn. As long as this is a wrong attribution, the whole sentence should be regarded as false because it can only represent a possible error, i.e., an erroneous cognitive state.

The issues involved here are eventually connected with an epistemological problem, i.e., the problem of explaining an erroneous cognitive state. Nyāya contends that our error consists only in our wrong attribution of a property to a subject. But the property itself or the subject itself must be a *real* entity of this universe. The Buddhist claims that an error does not necessarily consist in the wrong attribution. According to a section of the Buddhists (viz., the proto-Mādhyamika), an error consists in making an unreal thing appear as real. The Nyāya theory is called the *anyathākhyāti* theory of error, while the proto-Mādhyamika view is called the *asatkhyāti* theory of error.

Let us consider the situation of a perceptual error for the purpose of comparison. When someone perceives (erroneously) a snake in a situation where only a rope is present in the visual field and hence is in contact with one's sense organ, we can say that he has an erroneous perception of the snake. In fact we can show him that what he saw was not a snake but actually a rope by examining the object further. But if he is dense enough (or, philosophic enough) to ask "It was not *what* snake?" we will be in trouble because it will be difficult to deny successfully the existence of a non-existent or imagined snake. Whether or not he has seen a *real* snake in life before is just beside the point here. The particular snake which he *thought* he perceived a moment ago cannot be the subject of a successful denial because if that particular snake (or, perhaps, we should say, the snake particular) is totally non-existent then the denial of its existence will be pointless, and if it is supposed to have some sort of existence (i.e., 'subsistence') then the denial will be contradictory. One may resort to such an ambiguous position as the following: The particular snake I experienced a moment ago is not on the same level of reality as this piece of rope which I

am experiencing now, but, nevertheless, that particular snake-fiction is not entirely unreal because otherwise I would not have experienced it a moment ago. This will invite a host of philosophic questions about the nature and criteria of reality which we need not go into here. Our purpose will be served if we remember the metaphysical background in which the Nyāya and the Buddhist theories of error were developed.

It will be consistent for the Buddhist to say that the object of an erroneous cognition (or of a dream cognition), viz., 'this is a snake', is unreal. The following judgment, viz., 'this is not a snake', which destroys the error reveals simply the unreality, i.e., nonexistence, of the snake. Suppose we accept causal efficiency as our criterion of reality. A *real* entity may be the object (*viṣaya*) of a perceptual cognition by being somehow causally related to the production of that perception. But if something has become the 'object' (*viṣaya*) of a cognitive state, it does not follow that it must have been causally related to the production of that cognitive state. For example, the 'snake' grasped by an erroneous perception of the form 'this is a snake' becomes the 'object' of this cognitive state without apparently being causally related to it. Thus, a cognitive state is an intentional act where a nonexistent entity can very well be revealed as the 'object'. This is, in brief, what is implied by the *asatkhyāti* theory of error.[12]

The Nyāya reply to this is somewhat theory-bound. Nyāya realism does not admit that a *totally* fictitious entity can be the 'object' of any cognitive state, even of an error. Nyāya attempts to construct a theory of reality, a conceptual scheme, that consists of some interconnected basic categories (viz., the scheme of Vaiśeṣika categories). Thus, it is asserted that corresponding to each fundamental element of thought or cognitive state there is a fundamental element of reality. The socalled fiction is always constructed out of real elements. And these real elements can be categorized under some basic principles.

A judgmental cognitive state combines two or more elements of reality, and a sentence expresses such a state. An error or erroneous judgment combines two elements of reality which are not actually so combined. To be more precise, an error combines two elements of reality that are not so

combined in reality. One might say that the verbal expression of an error purports to refer to a fictitious entity. But Nyāya hastens to add that the fundamental elements that go to constitute the object-content of an error are all real elements or real properties exemplified somewhere in the world. Even the oddest imagination can be broken into elements each of which is not just 'airy nothing' but 'has a local habitation and a name', i.e., is real.

Nyāya criticizes the *asatkhyāti* theory of the Buddhist by saying that what becomes the 'object' of a cognitive state is also, in some acceptable sense, causally related to that cognitive state, and that it is absurd to suggest that a fictitious non-entity can cause anything. Thus, in the case of perception, what becomes the 'object' causes, at the same time, the perception itself as an event. Even a perceptual error has an 'objective basis' (*ālambana*) which causes such an error. In the case of wrong inference also, we do not deal with fictions. We are either mistaken about our initial perception which lies at the root of such an inference or we fail to apply the rules of correct inference. In the case of an erroneous cognitive state derived from someone's utterance, we should analyse its object-content also in a similar fashion.

It may be argued that the expression 'the rabbit's horn' is understood to refer to some nonexistent entity because no such thing as the rabbit's horn is found in this universe. Nyāya meets the objection in this way. Like perception, language is also a source of knowledge. Through words or a word-complex, we know *atomic* objects. This is called conception. And from sentences we know *facts* or object-complexes. This is called judgment. Thus, the situation is comparable to that of perception where we can have either judgmental perception of facts or 'simple' perception of (atomic) objects. Error arises in the case of judgmental or qualificative perception only (see Matilal, 1968a, p. 16 f). It is impossible for a non-qualificative 'simple' perception to be wrong about anything unless we allow that the 'simple', unitary (indivisible) object-content of such a perception can sometimes be *totally* fictitious having no 'objective basis' (*ālambana*) in the objective world. But as far as Nyāya is concerned this possibility is ruled out. A qualificative perception can be described as '*a* sees that *x* is *P*', and hence

there arises the chance of its being erroneous in case the property expressed by '*P*' is not actually present in *x*. Here, *x* is the *ālambana* 'objective basis'. The property expressed by '*P*' may be a *simple* one, or, it may be a complex one in which case it should be analysable into *simple* components.

VI. THE IMPLICIT NYĀYA SEMANTIC PRINCIPLE

Nyāya asserts that a simple, non-complex property can never be *empty*. We cannot conceive of a simple, non-complex property which is not instantiated by anything in this world. Acceptance of this principle is almost axiomatic in the Nyāya system. Thus, a complex property is held to be analysable in this system into 'simple' components which must be individually instantiated somewhere in the actual world. When we say that a particular property is empty, we mean that the combination of a number of simple *real* (i.e., non-empty) properties is not as such exemplified in the actual world (at a given time). One may combine two contradictory or mutually exclusive properties in which case the combination will be expressed by a self-contradictory expression. One may also combine two non-exclusive, but hitherto uncombined or unconnected, properties in which case it will be an empty property expressed by a non-referring expression. "The son of a barren woman" will be an example of the first kind, "the rabbit's horn," "a man who is twenty-feet high," and "the hair of a turtle" are examples of the second kind. (Note that one has to take the time of utterance also into consideration: "the present king of France" was not a non-referring expression when France was a monarchy, nor "the first man in the moon" is so now since the time Neil Armstrong landed on the moon.)

A problem will apparently arise if someone insists that a non-referring expression such as "the rabbit's horn" or "unicorn" is not the result of a combination but should be treated as an 'atomic' non-divisible expression. In other words, whatever is signified by such an expression could be regarded as a simple, indivisible property. In that case, one can say that we

do utter expressions signifying simple, indivisible properties which have no exemplification in the world of experience. Udayana anticipates this objection. He adds that if for any perverse reason one wishes to admit expressions in our language, which signify simple but fictitious (empty) properties, one will have to find a way to distinguish between two different expressions which signify two empty (but presumably different) properties.[13]

To explain: Unless we allow the meaning of "unicorn" to be indistinguishable from the meaning of "goblin" (or, from that of "the round square") we cannot hope to prove that these expressions signify 'simple' but different *empty* properties. The meaning of such expression cannot, in the first place, be learnt by ostensive means. We depend upon descriptions to make their meanings understood. Thus it is that the apparently unitary expression finally resolves itself into a series of descriptions which will, in their turn, signify complex properties.

The way Nyāya deals with this problem seems to be close to what Carnap has to say about his artificial language system S_1[14]:

> Generally speaking, it must perhaps be admitted that a designator can primarily express an intension only if it is exemplified. However, once we have some designators which have a primary intension, we can build compound designators out of them which express derivative, complex intensions, no matter whether these compound designators are exemplified or not.

Nyāya believes that there is a class of 'simple' properties (which are exemplified and) which are expressed by a class of 'simple' (non-compound) designators. But compound designators express complex properties which may or may not be exemplified.

Following the Nyāya principle we can resolve

A "A rabbit's horn is sharp"[15]

as follows: "(1) Something is characterized by horn-ness and (2) it is characterized by the property of belonging to a rabbit and (3) it is also characterized by sharpness." Of these constituents, if (1) is true, (2) cannot be

true, and vice versa. And (3) can be true or not true according to whether the subject (whatever that is) is sharp or not. But, in no case will the conjunction be true. And, we can resolve

B "A rabbit's horn is not sharp"

as follows: "(1) Something is characterized by horn-ness and (2) it is characterized by the property of belonging to a rabbit and (3′) it is also characterized by the absence of sharpness." This will be equally *not true* (*a-pramā*) as before because both (1) and (2) cannot be factually true together. (3′) will be true or false according to whether its supposed contradictory (3) is false or true. Thus, the law of contradiction is not violated because B, as a whole, is not strictly the contradictory of A (when both of them are thus analyzed). The relation of contradiction may hold between (3) and (3′).

One may note here that Russell has declared that a sentence of type B is ambiguous. He introduces the notion of "primary" and "secondary" occurrences of descriptions to explain this ambiguity.[16] The Nyāya analysis given here seems to forestall the problem of double interpretation by declaring even B-type sentences as not true.

VII. INTERPRETATION OF EXISTENCE AND NEGATION

Using the customary symbols and truth tables of modern logic, we shall try in this section to understand the Nyāya and the Buddhist principles in a somewhat systematic manner. The Buddhist claim may admit of the following analysis: Existence can be predicated in the object-language presumably by some expression like:

$$(\exists x)\ (x = a)$$

This is roughly similar to Quine's method of treating such sentences as "*a* exists" (viz., "Pegasus exists"). When this sentence is false it incorporates a non-designating term '*a*'.[17]

In order to explain the Nyāya principle we have to use a notion which is usually called 'semantic ascent'. Let us use 'h' to express "it is the case that" (cf. Frege's horizontal); now, where 'P' stands for any sentence we can have the following truth table:

P		hP
T	T	
F	F	
I	F	

(Here 'T' means 'true', 'F' means 'false', and 'I' means 'neither true nor false' i.e., 'indeterminate'.) Existence can be expressed via semantic ascent by some expression like:

$$h(\exists x)\ (x=a)$$

Now, the Nyāya manoeuvre roughly consists in this. What is ordinarily not determinate, i.e., neither true nor false, is transformed into a falsity via semantic ascent. The principle can be stated as:

IF 'Fa' or 'a is F' is determinate (true or false) THEN
$h(\exists x)\ (x=a)$

Its contraposed version would be:

IF~$h(\exists x)\ (x=a)$ THEN 'Fa' or 'a is F' is not determinate.

In fact, instead of talking about the rabbit's horn we are talking by semantic ascent about the sense of 'the rabbit's horn'. We are not reading the existential statement as 'There is something x which is identical with the rabbit's horn', but as 'It is the case *that* there is something x which is identical with (the sense of) *the rabbit's horn*'. We should also note that both the above conditional and its contrapositive are determinate even if their antecedents are true.

My present expedient is largely derived from Timothy Smiley's formalized outline in his 'Sense Without Denotation'.[18] Smiley introduces the singulary connective 't' (comparable to our 'h'), which is governed by

the rule: the value of the sentence to shall be *T* if the value of the sentence A is *T*; otherwise it shall be *F* (Smiley, 1960, p. 128). Smiley then introduces the distinction between 'primary' and 'secondary' occurrences of terms and a corresponding distinction between two kinds of predicates. Particularly interesting is his contrast between what he calls the primary negation-sign and the secondary negation-sign. In the case of primary negation, a sentence and its negation are contraries in that they cannot be simultaneously true. In the case of secondary negation, on the other hand, a sentence and its negation are contradictories, for always one and only one of them is true (Smiley, 1960, p. 129). Thus, a satisfactory interpretation of existence statements and their negations eventually leads to the clarification of different senses of negation, to which we shall now direct our attention.

It will be convenient to explain the difference between the Nyāya method and the Buddhist method of interpreting the affirmative and the negative sentences with empty subject terms by making use of the notion of 'choice negation' and 'complementation' or 'exclusion negation'. A choice-negation of a proposition '*a* is *F*' or '*Fa*' will give us a falsity if '*Fa*' were true, and a truth if '*Fa*' were false. But if '*Fa*' is indeterminate (e.g., "The rabbit's horn is sharp"), its choice-negation will also be indeterminate. In fact, the choice-negation presupposes a category-framework. If a predicate 'blue' is denied of the subject 'the pot', we are prepared to locate the subject in the category of coloured objects. If the proposition is indeterminate (i.e., neither true nor false) because the subject term is empty, its choice negation will also give another indeterminate proposition.

An exclusion negation ignores the category-framework. Let '~' represent choice negation and the horizontal over the letter represent exclusion negation or complementation. Writing '*h*' for "it is the case *that*" (cf. Frege's horizontal), we can define exclusion negation as follows:

$$\text{`}\bar{P}\text{'} =_{\text{df.}} \text{`}\sim hP\text{'} = \text{`it is } not \text{ true that'}$$

Writing 'T' for 'true', 'F' for 'false', and 'I' for 'neither true nor false' as before, we can set up the following truth tables:

Choice-negation Exclusion-negation

P	~P		P		P̄
T	F		T		F
F	T		F		T
I	I		I		T

Thus, '*Fa*' may be indeterminate while its exclusion negation is true.

My contention is that Nyāya seems to be favouring (vaguely) a sort of choice-negation and this is no wonder when we think that Nyāya has always chosen to work within some (i.e., the Vaiśeṣika) category-framework. But the Buddhist seems to be favouring a sort of exclusion negation and therefore rules that negation of the indeterminate is true. In fact the Nyāya concept of negation is more radical than what the idea of choice negation implies.

The Nyāya and the Buddhist position might be encapsulated in the following two alternative model theories:

For Nyāya, a model of the language is a pair $\langle D, f \rangle$ where the first component, D, is any non-empty set of actual things, i.e., things that are there and can be experienced or established by some accredited source of knowledge (*pramāṇa*). The second component, f, is a function assigning sets to singular terms and predicates as follows:

$f(a)$ is a unit set for each singular term a.
$f(P)$ is a non-empty set for each 'non-complex' predicate letter P.

For the Buddhist, a model of the language can be stated as above except for an expanded ontology. In other words, D is taken here to be a set of Meinongian objects, some of which are actual and others are fictional. The following thesis is rejected by the Buddhist but maintained by the Nyāya:

T_1: $f(P) \neq 0$ (where 'P' is a non-complex predicate).

We can summarize Udayana's reasons for accepting T_1 in this way.

(a) If $f(P)$ were empty, then the *sense* of P cannot be learnt.

(b) If $f(P) = f(Q) = 0$, then the senses of P and Q cannot be distinguished.

Nyāya also accepts a second thesis:

T$_2$: Only some complex predicates can be empty.

The suggestion is that logically non-complex concepts can be *learnt* only in connection with its exemplification. Thus, "unicorn" could not be understood, i.e., would be unintelligible, unless it were logically complex. Thus, it should unpack as a combination of several simple, non-complex concepts or properties.

VIII. THE PAN-FICTIONAL APPROACH OF BUDDHISM

In order to escape the complexity of multivalued logic, Russell extended the concept of false statement to include sentences with empty descriptions as their subjects. He was rightly criticized by Strawson on the ground that in ordinary language the existence of some thing denoted by the subject of a sentence is a necessary condition of its utterance's being true or false.[19] Strawson's theory can, in fact, be systematically developed only with the assumption of more than two truth-values. One might suggest from this controversy that a multivalued system is even inescapable if logic is drawn closer to ordinary language. Besides, certain paradoxes can, perhaps, be better tackled in a multivalued system.

However, the Buddhist's insistence that we can and do make statements with empty subject terms need not be taken as a plea for accepting a third truth-value 'neither true nor false' ('indeterminate') to be attached to such statements. His argument is more like that of Meinong who wants us to accept the fact that there are *unreal* objects which can be spoken about, can be thought of or desired. We may describe an unreal object like the rabbit's horn as having a property or characteristic, such as non-momentariness (or, even the lack of potentiality to produce something). Thus, a term expressing

such an unreal object can very well be used as a 'disagreeing example' or as the subject term of the contraposed version of the universal concomitance between existence and momentariness.

The Buddhist, in fact, would like to put all the objects over which our thoughts and other psychological activities may range at the same level; and this will include not only (a) things which do exist now (i.e., which are assumed to be existent by the common people or by the realist) but also (b) things which do not exist now (i.e., past and future things), (c) things which cannot exist (viz., the rabbit's horn), and also (d) things of which it would be a logical contradiction to say that they exist (viz., the son of a barren woman). One point is common to all of these four groups, and this is that we can think about them and our mental activities can be directed toward all of them. In their theory of objects, the Buddhists were not interested in ontology or in the metaphysics of being. If this opens the door to idealism, it may be welcome to the Buddhist (because that would simply prove the Yogācāra point that objects are integral parts of, in fact, indistinguishable from, consciousness). Even without giving in to idealism the Sautrāntika Buddhist may maintain this theory of objects with due modification while emphasizing that the *real* objects are only momentary point-instants which are beyond the range of ordinary experience.

Appendix A

By way of documentation, I give below the translation of an excerpt from Udayana, *Ātmatattvaviveka*, pp. 56–69. The Sanskrit text is given in Appendix B. Order of paragraphs here follows that of the Sanskrit text given in B.

By such arguments, the negative method of inferring momentariness of an entity from its existence is also rejected.

Besides, there are some other defects in this negative inference. The minor term (the 'subject' *pakṣa*), the middle term (the 'inferential reason' *hetu*) and the example cited in such an inference

cannot be established by any means of knowledge. There cannot be any means of knowledge to establish a non-entity (i.e., a fiction, *avastu*). If it could be established by some means of knowledge it ceases to be a non-entity.

(Opponent:) If so, then your talk about the non-entity becomes self-contradictory.

(Proponent:) Does this self-contradiction points out that there is a means of knowledge to establish the non-entity? Or, (second question) does it reject the prohibitive statement that we should not talk about non-entity? Or, (third question) does it imply that we must concede such statements (about non-entity) which are unauthenticated, i.e., not established by any means of knowledge?

The first alternative is not tenable. Even a thousand of self-contradiction cannot conceivably show that (the non-entity like) the stable object (i.e., the minor term) or the absence of gradual efficiency etc. (i.e., the *hetu*) or the rabbit's horn (i.e., the example cited to support the general premise) is amenable to (a means of knowledge such as) perception and inference. If it could, what is the use of this silly fight over the nature of non-entities?

The second alternative is acceptable to us because we admit only valid means of knowledge.

(Opponent:) If the prohibitive statement is rejected, no statement with regard to non-entities will be possible.

(Proponent:) What else can we do but remain silent in regard to a matter where statement of any kind would be logically incongruent? Silence is better in such cases. (No statement is better than any statement in such matters.) Please consider yourself who is the better of the two: One who is making statements about entities that cannot be established by any means of knowledge? Or, the other person who remains speechless (on such occasions)?

(Opponent:) But, although you are a wise man, you have not remained silent yourself. You, on the other hand, have made a prohibitive statement with regard to our talk about non-entities!

(Proponent:) True. In order to avoid a self-contradictory object not established by any means of knowledge, you have conceded that one can make statements about the non-existent. Similarly, in order not to allow any statement about the non-entities in our discourse on the means of knowledge, we concede that a self-contradictory statement (prohibiting the use of non-entities) is possible although it is not supported by any means of knowledge. If you treated both the cases in the same manner, we would not have said anything about non-entities. (We have made the above self-contradictory statement because you first raised the question.)

To the third question we say the following: By whose command, may we ask you, one has to accept (in a philosophical discourse statements about) an object which is not established by any means of knowledge?

(Opponent:) Because use of such statements is deeply rooted in our habit (speech-behaviour).

(Proponent:) It will be a self-contradiction to claim that something which cannot be established by any means of knowledge can be deeply rooted in our speech-behaviour. (We speak about objects that appear in our experience and a non-entity cannot appear in our experience and hence cannot be spoken about.)

(Opponent:) Such entities are somehow established (through, for example, some wrong cognition).

(Proponent:) If it is an unreal entity it can never be established through any means of knowledge. If it is established by a means of knowledge, then we ask you to describe that means of knowledge. In *vāda*, i.e., the philosophic debate whose object is to seek truth, we expect you state the means of knowledge.

In the case of *jalpa* 'a philosophic debate whose sole object is to defeat the opponent' or in *vitaṇḍā* 'a philosophic debate whose sole object is to defeat without establishing any position' too, we will not be guilty of self-contradiction because we simply ask you about the means of knowledge by which your *pakṣa* 'minor term' etc. are

established. It is impossible as well as undesirable for you to answer by supplying the means of knowledge. If you answer without supplying the means of knowledge, then your own statement will be self-defeating because you have to admit yourself that there is no means of knowledge to establish your *pakṣa* 'minor term' etc. And if you do not answer at all you will meet the defeat-situation' (*nigrahasthāna*) called *a-pratibhā*, 'silence due to lack of intelligence'. [Read '*pakṣādiṣu*' instead of '*praśnādiṣu*'.]

If you could avoid self-contradiction by only conceding statements about non-entities (like the rabbit's horn) we could have allowed such an expedient. But this is not so. There is no lack of self-contradiction when we say that *something* with regard to which no statement can be made, can be the subject of a denial or a prohibitive statement.

(Opponent:) How can there be self-contradiction if we say (rephrasing our position) that a non-entity cannot be the subject of any affirmative statement?

(Proponent:) Oh! (Then we ask the following question:) Do you or do you not speak about something which can never be the subject of any affirmation or denial? In either way you will contradict yourself. In either case, that *something* would be a non-entity because a real entity cannot be such that we cannot make any statement about it.

If you say no to the above question, then it will contradict the very statement "(something) can never be the subject of any affirmation or denial". If you, on the other hand, say yes (that is, if you admit that we can speak about something which can never be the subject of any affirmation or denial), then contradiction will appear as soon as we discuss the nature of that object (that *something*). It does not hold that something cannot be talked about, i.e., affirmed or denied, and, at the same time, it can be talked about (in the manner just stated).

If you insist that a non-entity can be the subject of a denial (i.e., a negative statement), we would ask: why can it not be the subject of an affirmation too? The lack of an accredited means of knowing (such a non-entity) remains the same in both the cases.

(Opponent:) That the son of a barren woman does not speak can be proved (established) by pointing out that he is not a conscious being. But there is no way of proving that the son of a barren woman does speak. (Thus, we prefer the negative statements.)

(Proponent:) No. Even to prove that (the son of a barren woman does speak) you can assign the reason that he is a son (of someone and hence can speak). You cannot say that the son of a barren woman is not a son because if you do you will contradict yourself.

(Opponent:) It is a mere statement (viz., "the son of a barren women"), in fact there is no real son of a barren woman. (Hence no contradiction.)

(Proponent:) No. Even the lack of consciousness (which you adduced as your reason to prove lack of speech in the son of a barren woman) will be treated in the same manner. (One might say: "the lack of consciousness in the son of a barren woman" is a mere phrase there being no real son who lacks consciousness.) "Lack of consciousness" refers (in fact) to another nature which is different from consciousness.

(Opponent:) We simply want to deny (possession of) consciousness here, and this is quite possible.

(Proponent:) No. In our case also we will say then that we simply want to deny (possession of) the property of not being a son.

(Opponent:) Our mere denial of not being a son (human offspring) cannot by itself prove the presence of activity and speech. Thus, how can we adduce a reason (*hetu*) without including another competent, determinable (and positive) object (in our *hetu*)? (Denial cannot reveal an entity which we can use as our 'reason' *hetu*.)

(Proponent:) No. The same principle will apply to lack of consciousness.

(Opponent:) An object only in the form of a negation of the contradictory possibilities can be used as the reason (to prove anything). For example, the nature of being a *śiṃśapā* tree is adduced as the reason (in the inference: it is a tree because it is a *śiṃśapā* tree) because the nature of being a *śiṃśapā* means the negation of its not being a *śiṃśapā*. The son of a barren woman, on the other hand, not simply excludes (i.e., negates) the possibility of being a pot etc. (the contradictory possibilities) but also excludes the possibility of being a son (a human offspring) like Devadatta (which is not a contradictory possibility). Therefore, the nature of being the son of a barren woman cannot be adduced as the 'reason' *hetu.*

(Proponent:) The lack of consciousness (in the son of a barren woman) can also be treated in the same manner. It is not the case that the son of a barren woman (who lacks consciousness) excludes only such conscious beings as Devadatta and not also the unconscious objects such as a piece of wood.

(Opponent:) Speech is a property which is present only in real entities. Thus, in the face of contradiction, how can the presence of speech be proved in a non-entity?

(Proponent:) Through what means of knowledge can this contradiction be established? Is it because we apprehend non-entities always without speech? Or, because we do not apprehend speech divorced from a real entity?

A non-entity can never be apprehended through any means of knowledge. If it could, it will not be a non-entity. The latter alternative is also not tenable because we will be in the same predicament. Just as speech as divorced from any real entity cannot be established, so also lack of speech divorced from any real entity cannot be proved by any means of knowledge.

(Opponent:) There is only a conceptual construction of the lack of connection between the property speech and the subject.

(Proponent:) What can stop a 'conceptual construction' (*vikalpa*) of the connection between speech and the subject.

(Opponent:) To be a speaker means to produce speech. How can such a productive power be present in a non-entity which is (supposed to be) devoid of all power to do anything?

(Proponent:) How can there be even lack of speech? For, lack of speech means the character of producing what is not speech. (Speechlessness implies doing something else.)

(Opponent:) It is not contradictory to say that if there is lack of every power to do anything then there is also the lack of the power to speak.

(Proponent:) By what means of knowledge can it be established that the son of a barren woman lacks all power to do anything?

(Opponent:) It lacks all power because it is a non-entity.

(Proponent:) How can you establish that it is a non-entity?

(Opponent:) Because it lacks all power to do anything.

(Proponent:) In this way you are only moving here and there uttering mere words and trying to avoid the issue, just as a penniless borrower of money tries to avoid the money-lender. And you are not seeing the vicious circle (the defect of mutual dependence).

(Opponent:) It is a non-entity because it lacks both gradual efficiency and simultaneous efficiency. (If something cannot produce a thing either gradually or simultaneously, it is a non-entity.)

(Proponent:) No. In order to prove such lack of gradual or simultaneous efficiency, you have to adduce a means of knowledge. If the nature of being a son is applied to it, all other properties, such as being able to speak that invariably go along with being a son, can also be applied to it. Thus, how can there be any scope of proving the lack of gradual and simultaneous efficiency in it? How can there be any scope of proving that it is a non-entity? And, how can there be any chance of proving the lack of speech etc.? Therefore, it is our accredited means of knowledge only which is the limit within which our speech behaviour should operate. If this limit is transgressed, there will certainly be chaos.

Appendix B

The Context Principle and Some Indian Controversies over Meaning[*]

B. K. Matilal and P. K. Sen

I

Recent discussions show that there are several ways to flesh out and interpret Frege's remarks on the 'context principle'. Besides, we believe that the issue is only the tip of an iceberg. Whichever way one wishes to resolve the problem and interpret the principle, it has some important consequences for our epistemology and ontology. It has even been suggested that the controversy between the 'context' and the 'composition' principle may be broadened to set the background for learning philosophical lessons about the controversy between holism and atomism, even between realism and relativism. But there was also an 'Indian version' of the problem discussed and debated extensively by the exponents of the two sub-schools of classical Indian *Mīmāṃsā*.

In his *Two Dogmas of Empiricism*, W. V. Quine insisted upon the primacy of the sentence over word or term as the vehicle of meaning and attributed this doctrine to Frege's context principle in *Grundlagen* 60. It is significant to note that Quine in his *Word and Object* referred to the view of 'Indian Grammarians' in support of his view. In fact, it was the view of Bhartṛhari, a sixth-century AD grammarian of India, about whom J. Brough wrote an article in the *Transactions of Philological Society,* Oxford, 1951. Quine cited the article by Brough in his footnote. Quine's holistic

interpretation of the Fregean doctrine was based upon a mistake (as Michael Dummett and others have argued), but Quine remained faithful to his interpretation and described it as an 'important re-orientation in semantics' over the old term by term empiricism of Locke and Hume. Even in his latest book, *Theories and Things,* Quine labels this semantic primacy of sentence as one of the 'Five milestones of Empiricism', which gave us contextual definitions. Quine said that this is like the Copernican revolution in Astronomy, in being a shift of centre (p. 69). It made obvious that the words or terms are only like 'grammatical particles' for the meanings of words are abstractions from the truth-conditions of the sentence that contains them.

Whatever might be the correct interpretation of Frege's 'context principle', it is widely believed that he rejected it in his later writing implicitly. H. Sluga[1] has argued that Frege retained the principle in later writings, while M. Resnik[2] has said that he rejected it. Dummett has claimed that Frege retained a weaker version of it implicitly in his later writings. The modern exegetical literature on Frege is vast and varied. Recently Peter Milne[3] has pointed out further difficulties that one would face if one takes Frege to have understood the context principle as a thesis about reference along the lines advocated by Dummett and C. Wright.

In this paper we propose first to review very briefly the exegetical literature on the interpretation of the context principle, and then we will introduce the Indian formulations of what appears at least to be a similar problem. Having first explicitly acknowledged that the types of questions which led to the controversy between the 'context' and the 'composition' principles in the exegesis on Frege were not exactly the same as led to the classical Indian philosophical debate over the *anvitābhidhāna* 'connected designation', and the *abhihitānvaya* 'designation before connection' theory,[4] we aim to show also that the two controversies were not totally irrelevant to each other from the point of view of the philosophy of language. The purpose here is to bring out the points of contact and parallels between the discussion of Frege's context principle on the one hand and the long-lasting Indian debate on the other. It is believed that such endeavour may throw further light on the thorny issue and hence will be philosophically fruitful.

As a very modest beginning, we may formulate three very simple questions, to show the divergence of the ways the two controversies, one in the modern West and the other in classical India, developed.

(i) Does a word have a meaning only in the context of a sentence?
(ii) Is it possible to *know* what a word means only by considering sentential contexts in which it occurs?
(iii) Given that we know the meanings of words constituting a sentence, how do we come to *know,* understand, the meaning of the sentence as a connected whole (of meaning)?

It seems that the modern Fregean controversy is connected with (i) and perhaps also indirectly with (ii), while the classical Indian controversy is directly concerned with (iii). We would like to suggest further that the Indian philosophers were also indirectly concerned with (i), and perhaps also with (ii). That it was so is suggested by our study of Bhartṛhari who criticized and rejected both sides of the (Indian) controversy between the 'connected designation' and the 'designation-before-connection' theories. Bhartṛhari put forward a third alternative, which we may call 'sentence-holism'. He suggested a strong affirmative answer to question (i) and accepted its extreme consequence, namely, words have no meaning ouside, or isolated from, the context of a sentence just as 'rat' in the word 'Socrates' has no meaning. This would show at least that Quine's (mis-) interpretation of the Fregean doctrine has a philosophical basis and on similar considerations Bhartṛhari was led to his sentence holism. These three questions are however not unrelated. In order to answer question (iii) satisfactorily we need to know whether the words have meanings in isolation, independently of the context of the sentence in which they occur.

II

If we give a strong affirmative answer to question (i) above, we get a *strong* interpretation of the doctrine. Here the principle is to be understood in close

connection with the idea of a *contextual definition.* An affirmative answer to question (ii) leads to the *weak* interpretation. It is understood as simply a methodological policy: we should ask what a particular sub-sentential expression means only in the context of a sentence. It seems that some of Frege's remarks favoured the *strong,* some the *weak* interpretation. There is however an *intermediate* interpretation. These three interpretations differ in the following manner. In the strong interpretation, words and other sub-sentential expressions *have no meaning of their own.* In the weak interpretation, these sub-sentential expressions are not denied meanings of their own. In the intermediate interpretation, the meaning which the sub-sentential expressions have is only the contribution which they make to the meaning of the sentence in which they occur. The strength of this third interpretation lies in the fact that unlike the other two interpretations this one presents the principle itself in a favourable light. Textual evidence here is indirect (see Appendix for different formulations of the principle by Frege).

What is distinctive in the strong interpretation of the principle is that it invites us to understand the principle as saying that every expression which is short of a sentence must be defined contextually. But it is also this connection with the contextual definition which makes the principle, on this interpretation, unacceptable.

Let us first be clear about the exact significance of a contextual definition. Take a classic example of the use of the contextual definition: Russell's theory of (definite) descriptions.[5] Russell's definition of (definite) descriptions, given in his famous theory, is not actually designed to *say* what such an expression means; it is rather designed to *show* that we need not suppose that a descriptive phrase has any meaning of its own; it is designed to show that it is not a self-subsistent semantical unit at all, for the analysis the theory offers shows how such a phrase can be *eliminated* altogether from a sentence. If it is said that *every* definition, not only the contextual is a device for eliminating the phrase which is defined, we will show the basic difference between two sorts of eliminating devices—one, in the case of non-contextual, that is explicit, definition, and the other, in the case of the

contextual. The contextual definition, unlike the explicit definition, does not actually say what an expression means. A definition can be regarded as saying what an expression means, rather than being a mere device for eliminating the expression in question if and only if it can be construed as an answer to the question 'What does *a* mean?' where *a* is any expression. It can be stated in the form

a means *b.*

But this is the form of an explicit definition. What then does the contextual definition do? If we want to maintain, what we have just said against the supposition notwithstanding, that it also gives the meaning of the expression, how does it do so? It seems that it can give the meaning, if at all, only in the following way:

a means that by virtue of which S(*a*) means that *p*,

where S(*a*) is a sentence containing the expression *a* and '*p*' is replaced by some sentence giving the meaning of the sentence S(*a*) but not containing the expression *a.* But this does not really tell us *what* that meaning is by virtue of which this semantical equivalence between the two sentences holds. We can indeed put the point in the form of a paradox. The contextual definition tells about the meaning *x* of the expression *a* that it is

the x such that it makes S(*a*) mean the same as [*p*].

But according to Russell's own principle—a principle regarding what he calls knowledge by description—we can know this without knowing what this *x* is.

What has been said above shows, we think, that, treated as an account of the meaning of individual expressions, the contextual definition is very poor. So we should not perhaps treat the contextual definition as attempting that. What then does a contextual definition do? A very plausible answer is that it shows that we should not ask the question: what does the expression mean? (Just as we should not ask the questions: what does 'sake' mean in 'for the

sake of'? We should ask: what does 'for the sake of' mean? or, perhaps, what does 'Philip gave his life for the sake of his country' mean?)

Our opposition to the idea that the contextual definition can be treated as a way of giving the meaning of a word and other sub-sentential expressions can be misunderstood. So let us be quite clear about the nature of this opposition. Our main objection to this idea is that the contextual definition does not tell us *what* the expression means. It tells us *at most* that the expression means *something* by virtue of which a certain equivalence, namely the equivalence between the definiendum and the definiens, obtains, without telling us what that something is. Note that this is *not* an objection to the device called 'contextual definition' as such, but to the view that by this device we *give the meaning of the expression defined.* This objection need not be withdrawn in the face of standard contextual definition of a sentential connective, for example '&', wherein truth-conditions of sentences, formed by the help of such a connective, are specified. Here too, the only thing that the definition does by way of giving the *meaning* of the sentential connective is that it tells us that the connective means something by virtue of which sentences formed by their help have the truth-conditions they have. In fact, in the case of a sentential connective, more than in any other case, it is clear that the contextual definition *need* not be taken to give the meaning of a connective; it can be taken to do *just* what it does, namely, *give the truth-conditions* of sentences formed by using the connective. For the purposes of *logic,* after all, nothing else is necessary. (What does it matter if we do not know what the connective *means*, once we know the relevant truth-conditions? For if we know what the truth-conditions of sentences formed by using the sentential connectives are, we can define *validity* of formulas containing them, the relation of *logical consequence* among such formulas, and all other similar concepts which have any importance for logic.)

One may ask, at this point, 'What is meaning but truth-conditions?' But we can answer this question without entering into the larger issue of whether we can indeed *identify* meaning with truth-conditions. The answer is that even if meaning is nothing but the truth-conditions, it is only the

meaning of the *sentence* which is constituted by truth-conditions, and *not* the meaning of the sentential connective which the sentence contains. Truth-conditions can constitute the meaning at most of what they are truth-conditions of; and that is the sentence and not the sentential connective.

Now, one may still say that the context principle should be understood in any case in terms of the contextual definition, which can then be understood in the manner just suggested. But even this would not really be plausible at all. For, to make use of the idea of contextual definition in our account of the context principle, we shall have to make a complete generalization first. That is, we shall have to say that *all* expressions which fall short of complete sentences must be defined contextually, for the context principle is a principle which is valid for all such expressions. But to make this generalization is to obliterate a distinction on which the very plausibility of the idea of a contextual definition rests. It has never been a part of the thesis that all terms can be defined only contextually, but only that some terms have to be so defined. In fact, the idea of contextual definition thrives on the distinction which Russell had in his mind, namely the distinction between complete and incomplete expressions. It is not the case that *all* expressions are incomplete without exception; only some expressions are so. It is only in the case of incomplete expressions that the contextual definition would be appropriate; it would not be appropriate in the case of complete expressions. There is indeed some intrinsic difficulty in the idea that the contextual definition be applied to *all* terms, for the very idea behind the kind of definition Russell has offered is that the descriptive phrase, for which the definition is paradigmatically apt, can be eliminated altogether from our language, and in favour of the expressions which are *not* incomplete: we need not have these incomplete expressions in our language, we can make do with the complete expressions alone.

There is yet another reason why we should not try to understand the context principle in terms of the contextual definition. If we take the strong interpretation of the principle which this would force upon us, the context principle would be utterly incompatible with the composition principle. If the individual expressions—words and other sub-sentential expressions—do

not have any meaning of their own, there cannot be any question of deciphering the meaning of a whole sentence by (a kind of) step-by-step construction from the meanings of words. But Frege is not prepared to give up the composition principle, as Dummett so rightly emphasizes (see below).

One may say that our objections to the interpretation of the context principle in terms of the idea of contextual definition are based on a questionable assumption. It is the assumption that contextual definition was understood by Frege in the way in which it was by Russell. But, it may be said, this assumption itself is wrong; and that it is wrong is shown by the fact that, while for Russell the contextual definition is a device for *elimination* (and, therefore, for a kind of reduction), for Frege it is not so. In fact, the possibility of giving a contextual definition for a singular term occurring in a sentential context shows, for Frege, that the singular term *does have* reference after all.[6] By contrast, Russell gave his definition of definite descriptions—for example, of 'the present king of France'—just to show that the definite description does *not* have any reference.

It is true that Frege's contextual definition is different from Russell's in this respect, and that we have not so far laid any emphasis on this fact. (This is on the assumption that we are not making any mistake by ascribing to Frege the use of the idea of contextual definition.) But our critique of the interpretation of the context principle in terms of contextual definition cannot be faulted on that ground. The critique remains valid even if the difference just noted between the two conceptions of contextual definition exists and is otherwise important. On the Fregean conception, the contextual definition would indeed tell us that an expression, typically a singular term, has reference, and, for that matter, sense as well. But telling that an expression has reference (or sense) is certainly different from telling *what* that reference (or sense) is. If it is said that the reference, and consequently the sense, are given by the expression itself (as Dummett has suggested)—the singular term 'the morning star' gives both the planet and a mode of presentation of the planet, say—then what does the definition do? The definition itself sets up equivalence between sentences; but it does so

without specifying the ground of this equivalence: the meaning, that is, the sense or the reference.

The weak interpretation of the context principle has the merit of being quite uncontroversial. Who will deny that the best way, and, in the case of some expressions, the only way, in which we can ascertain the meaning of sub-sentential expressions is by observing how they are used in sentences to say something? Consider how the archaeologists have done their job of deciphering inscriptions in long lost and dead languages. Their only *method* has been that of observing patiently, sometimes over the years, how the same character occurs in different constructions.

But since the context principle, on this interpretation, becomes so unexceptionable, we may doubt whether this is all that Frege had in his mind. One of the things which Frege certainly meant us to take seriously—this becomes evident when we consider his actual use of the principle in the development of his theory of number—is that it does not matter whether we are able to identify in each case something to be the meaning of a given sub-sentential expression and form a self-subsistent idea to represent this meaning; it is sufficient if we can say what the sentence in which it occurs means as a whole, and tell how the expression in question is used in it. So what Frege had in his mind when he advocated the context principle is not just a matter of discovering the meaning of an individual expression, it is also something about the individual expression's *having* the meaning it has. The weak interpretation therefore, is too weak to bring out the full significance of the Fregean principle. Thus, it seems that we shall have to reject both the strong interpretation given in terms of the idea of contextual definition and the weak interpretation which treats the principle just as a methodological advice. We are then left with what we have called the intermediate interpretation. To a consideration of this we may turn now.

III

What the intermediate interpretation tells us is that the meaning of a sub-sentential expression is nothing but its contribution to the meaning of the sentence in which it occurs. Dummett, who apparently takes the context principle in this form, also gives what seems to us to be the best possible defence of the principle if it is so taken. The defence goes as follows: the main, if not the sole, function of language is that we use it for *saying* things, to perform linguistic (speech) acts. But we cannot say anything, in the strict sense of the word 'say', without the use of whole sentences. It is only by use of whole sentences that we can make 'moves' in language, to put it in Dummett's words. It follows from this that the significance of sub-sentential expressions also lies in that they enable us to say whatever we want to say. But how do these expressions help us in the matter of saying whatever we want to say? Surely by forming parts of sentences and contributing to the significance of sentences of which they form parts. Thus the meaning of the sub-sentential expressions, we can now say, consists in the contribution which they make to the meaning of the sentences.

The exact significance of the context principle is not really so easy to bring out even in this intermediate or moderate form. In being clear about the meanings of the individual expressions, in terms of contributions made to the meanings of sentences, we shall have to keep in mind the distinction between sense and reference drawn by Frege, although this is a distinction which is absent from Frege's early writings, including *The Foundations of Arithmetic* where the context principle is broached.

The context principle says that the meaning of a sub-sentential expression is nothing but what it contributes to the meaning of the sentence. But what is the meaning of a sentence? Granting that the meaning of the sentence is what Frege calls its 'sense', we shall have to say that the meaning of the sentence is its truth-conditions (at least that is the usual understanding of the idea of sense in Frege). What then is the contribution of a sub-sentential expression to the meaning of the sentences in which they occur? It would surely be the contribution which it makes to the determination of the truth-value of these sentences. If we now ask the further question regarding what, or how, the individual expression

contributes to the truth-conditions of the sentences, say, of the atomic sentence 'Socrates is wise', we find that the name 'Socrates' contributes to its truth-conditions by introducing the individual Socrates, and the predicate, 'wise' or 'is wise', or '(....) is wise', or whatever it is—does it by introducing the concept *wise.* But we have to realize that the individual and the concept are both *referents* of the respective expressions, or what are called by Dummett their *semantic values.* But this realization would actually make us less confident about the correctness of this approach to the idea of the meaning of a sub-sentential expression being what it contributes to the truth-conditions; at the same time, it would also cast doubt on the idea that the meaning (or sense) of the sentence is nothing but its truth-conditions. The general principle which seems simultaneously to undermine both is that it is the reference of the complex expression which is determined by the reference of the constituents. We can, of course, think of ways out of this difficulty, but that will have to be worked out only in the light of a more detailed consideration of the sense/reference distinction.

IV

Some scholars writing on the context principle have suggested that in putting forward the context principle Frege was actually trying to find his own solution to what is basically a Kantian problem, namely, the problem of explaining *the unity of thought.* The unity of thought, for Kant, is a judgement. A judgement involves synthesis, and it is this synthesis which brings about the unity of the judgement, the fact that a judgement is *one* in spite of its essential complexity (which complexity is in the long run due to the complexity of the *manifold of sense*). The synthesis, bringing about the unity in a judgement, is guided by a rule (and it is this which makes the synthesis intelligent, as opposed to blind, and confers whatever *objectivity* a judgement has despite the fact that the synthesis, and to that extent the judgement itself, is a subjective act operating on a subjective manifold). This rule, for Kant, is always some *concept.* In fact two kinds of concepts are

involved in every judgement, the concepts functioning as the predicate(s) *and* the concepts functioning as the categories of understanding. (Thus 'Socrates is wise' involves the concept *wise* as well as the concept (category) of substance-and-accidens.) So it is true to say that the unity of the judgement, and so of the thought, is explained by Kant in terms of the concepts. We may now identify the concepts to which this function is ascribed by Kant with the concepts, or, more generally, functions, Frege is talking about. If we do so, we can say that it is the same role which is ascribed to the concepts by both Kant and Frege; for certainly it is the concept (or function) which gives unity to the thoughts according to Frege: being the unsaturated component in our thought it is the concept (function) which makes its unity possible.

It is a very good question to ask here whether this identification of the Kantian concept with the Fregean is at all correct. There are some obvious differences, for sure, between the two. Concepts, and functions generally, form an important item in Frege's ontology, but they are not accorded any ontological status by Kant. Concepts confer unity to our thoughts, judgements in Kant's view, because they are the rules of *synthesis,* which is a mental act; but there is no question of any synthesis being involved in bringing about the unity for Frege. In fact, the unity of thought is not a thing which is *brought about* by an act of the mind, in Frege's theory, it is something which is out there, albeit in the third realm, independently of us and of our activities. Thoughts are objective entities, their unity is also something objective.

One may, however, say that these differences do not really matter for the limited perspective from which the analogy is drawn. From that perspective, the only thing which is important is that concepts, for both philosophers, are what explain the unity of thought, whatever may be the details of the explanation offered by any of them. Let us grant this. But even so, we are not entitled to conclude that the *context principle* is put forward by Frege to explain the unity of thought. The unity of thought is explained by Frege by invoking the idea of an unsaturated part of the thought, which unites *itself* with the other part, without requiring a *tertium quid.* To say now that it is

here that the context principle is brought into play is to make exactly the mistake of supposing that the context principle is to be understood in terms of the saturated/unsaturated distinction.[7]

V

A few words are in order here concerning the relationship of the context principle and what is now called 'the composition principle'. The composition principle says that the meaning (sense) of a whole sentence is determined by (*composed* of) the meaning (sense) of the words out of which the sentence is composed. Apparently, at least, this principle is inconsistent with the context principle. For while the context principle seems to take the meaning (sense) of the *sentence* to be primary, the composition principle seems to take the meaning (sense) of the *word* to be primary.

In his first book on Frege, *Frege: Philosophy of Language*, Michael Dummett discusses the question whether it is possible to reconcile the context principle with the composition principle, to both of which Frege seems to have been committed. His answer to the question is that they *can* be reconciled, and he suggests that they can be reconciled in the following way: 'In the order of *explanation* the sense of a sentence is primary, but in the order of *recognition* the sense of a word is primary.'[8] In so far as the knowledge of what a particular significant stretch of discourse means is concerned, knowledge of the sense of individual words must precede any knowledge of the sentence as a whole; the reason for this being that the sense of the sentence is itself determined, and determined in the very strong sense of being actually made up of, the senses of the words which constitute the sentence. (This is the Composition Principle.) Since the meaning of the sentence is what is determined by the meaning of the words, we cannot know what the meaning of the whole sentence is unless we know what the words which make up the sentence mean.

> We thus derive our knowledge of the sense of any given sentence from our previous knowledge of the senses of the words that

compose it, together with our observation of the way in which they are combined in that sentence. (p. 4)

But, on the other hand, it is the sense of the sentence which must be regarded as primary in the order of *explanation* of the sense of any significant stretch of discourse; this explanation of the sense of the words, as well as sentences, being understood as a *general* explanation of what it is for sentences and words to have a sense, 'that is, of what it is for us to grasp their sense'. Dummett continues,

> For Frege the sense of a word or of any expression not a sentence can be understood only as consisting in the contribution which it makes to determining the sense of any sentence in which it may occur. Since it is only by means of a sentence that we may perform a linguistic act—that we can *say* anything—the possession of sense by a word or complex expression short of a sentence cannot consist in anything else but its being governed by a general rule which partially specifies the sense of sentences containing it.

Dummett is aware that this way of understanding the relationship of the sense of sentences and the sense of words can be defended only if we could give an account of what it is for a sentence to have sense without any reference to the sentence being formed out of meaningful words. (That is, we should not say that for the sentence to have sense is to be composed of words which have sense.) So Dummett adds further:

> If this is so, then, on pain of circularity, the general notion of the sense possessed by a sentence must be capable of being explained without reference to the notion of the senses of constituent words or expressions. This is possible via the conception of truth-conditions: to grasp the sense of a sentence is, in general, to know the conditions under which that sentence is true and the conditions under which it is false. (pp. 4–5).

VI

We now propose to examine the issues before the Indian philosophers, issues which provided a context in which it has been thought that some sort of a 'context' principle was enunciated against an atomistic theory where the sentence-meaning as a whole is supposed to be constituted by the atoms of word-meaning. One issue was about the significant units of language, that is, the proper locus of meaning. (Frege might or might not have been concerned with this issue in *Grundlagen.*) The task before us now is to provide an exegesis on certain arguments of the Indian philosophers to illuminate the central point in the controversy. But at the very outset, one word of caution to avoid possible misunderstanding. In what follows we will not make the usual distinction between sense and reference. Although a somewhat similar distinction between the 'mode of presentation' and the 'reference' was known to the Naiyāyikas, for the present purpose we would use the ambiguous word 'meaning', and accept some version of the reference theory of meaning.

In *Vākyapadīya*, ch. 2, Bhartṛhari notes that regarding the notion of the sentence and sentence-meaning there are two principal philosophical theses: one is called the 'indivisibility' thesis (*a-khaṇḍa-pakṣa*) and the other is the 'divisibility' thesis (*khaṇḍa-pakṣa*). The first thesis is what Bhartṛhari himself maintains while the second is held by his opponents, the Mīmāṃsakas. For our purpose we propose to call the first 'sentence-holism' and the second 'atomism'. They had two main questions before them: what is a sentence, and what constitutes the sentence-meaning? More specifically, how is a sentence constituted, and how is the meaning of a whole sentence cognized by the hearer after the utterance is made? According to sentence-holism, sentences are wholes and they are the unanalysable units of meaningful discourse. Similarly, the meanings of sentences themselves are wholes. In fact they are also timeless. For destruction is usually believed to be dissolution into parts. We reach words as parts of the sentence, and word-meanings as parts of the sentence-meaning through 'analysis, synthesis and abstraction' (a method that is called *apoddhāra*). This method is only

instrumental in facilitating our language-learning, a convenient way of making explicit our implicit linguistic competence. The words are no less abstractions than the letters are. The meaning of a word in isolation is an imaginary construct. In fact words are as much devoid of meaning as the letters or some syllables in a word, like 'rat' in 'Socrates'. The meaning of a complete sentence is given to us as a whole block of reality. We chip this whole and correlate such abstracted (extracted) bits and pieces of meaning with words and particles which are also reached by such a process of breaking apart the whole sentence. On this theory, a sentence cannot be a composite entity with words as constituent elements, and the meaning of a sentence likewise cannot be given by the allocation or computation of word-meanings individually considered. This view is very similar to that of W. V. Quine's, as noted already, and hence Quine's reference to it was justified. The whole meaning though expressed by a sentence can share a common structure, and have common 'parts' but such parts would not be capable of existing in isolation from the rest. In this sense, they could be just our own 'abstractions'. A weaker implication may be that in ontological terms, the wholes (whether sentences or other wholes) may have parts but such parts lose their significance (perhaps *ontic* significance) as soon as they lose their contextuality in the whole. The opponent would have to say that there may be wholes which have parts but the latter will not lose any ontic significance if they lose contextuality. This holistic solution of Bhartṛhari was seriously challenged by the Mīmāṃsakas in the tradition.

VII

We shall leave aside Bhartṛhari and discuss the so-called atomistic views of the two Mīmāṃsā sub-schools.[9] Both atomistic views recognized that the sentence is a composite entity composed of elements which we call words, particles, etc. These elements are meaningful units of expression. The sentence-meaning must be connected with these units. The hearer grasps the meaning of a sentence or what is spoken, provided he has what we may call

linguistic competence, that is, knowledge of the meanings of words and particles as well as of how that particular language works. On this view, it will be unreasonable to take sentences as the smallest meaningful units, for sentences are virtually countless and we certainly cannot learn a language by learning those countless sentences and their meanings. It is only by learning a few (a finite number of) words and seeing how that language works that we gain the linguistic competence described above.

What has been stated in the last paragraph is commonly held by the two sub-schools of Mīmāṃsā, the Bhāṭṭa and the Prābhākara. They both reject Bhartṛhari's view. But internal differences between these two sub-schools led to great controversies for several centuries. This becomes clear as soon as we ask the following question: how does the competent hearer recognize sentence-meaning as a whole from hearing, in bits and pieces, the constituent words in sequence? Does he first cognize or recognize the meaning of each constituent word and then joins these bits and pieces of meaning together to cognize a connected whole—the sentence-meaning? If our answer is yes, then we are talking from the Bhāṭṭa point of view. Designation by words first, then the designata are connected to form a unity (*abhihitānvaya*). Alternatively, the Prābhākara says that a person recognizes the meaning of the whole sentence by hearing simply the constituent words put together syntactically: 'connected designation (by any word)' (*anvitābhidhāna*).

On the first (Bhāṭṭa) view, the hearer recognizes the meaning of the whole sentence by figuring out first the meanings of individual words whereas on the second (Prābhākara) view, he recognizes the meaning of the sentences *directly* from the words themselves skipping the intermediate step of grasping singly the individual word-meanings. Phrased in this way the distinction may seem trivial, but it is not really so. A little reflection shows that on the first view meanings of words are assumed to be independent units, as *complete* objects. In recognizing the meaning of a sentence (i.e., interpreting a sentence made of several words), we as hearers must first obtain these self-subsistent building blocks (meanings) and then cement these blocks to obtain the connected meaning of the sentence. This implies

that the distinction between word-meanings and sentence-meaning is one of building blocks and the building itself. Here we move close to the intuition which prompted the modern 'composition' principle. Notice that the words cannot have meanings *only* in the context of a sentence on this view, and hence it does not seem compatible with what we have called the *strong* interpretation of the context principle.

Further the word 'directly' in the second view, that we recognize or obtain the sentence-meaning *directly* from the words themselves, means that there is no intervening event such as that of our getting hold first of the so-called word-meanings as building blocks, between our knowledge of the words (through hearing) and our knowledge of the meaning of the sentences made of such words. This has the implication that the meanings of the words are not, in some sense, context-free, independent objects. Whatever a word designates, it is always related or connected (*anvita*) with the designation of other words in the sentence. Notice that it comes very close to saying that a word gains its proper meaning *only* in a context, that is, in the context of a sentence. In fact, the second view expressly advocates that we know or learn the meaning of a word only by considering the sentential context in which it occurs. Apart from this, we must note that the main point in the dispute is epistemological. The question is how do we come to know, as we invariably do, the complete and connected meaning of the sentence simply on the basis of our knowledge of the constituent elements, the words? It is clear that we derive our knowledge of such distinct (constituent) elements through hearing (or seeing) the words as well as their interconnections. (It should be noted that knowledge of *meaning* of the sentence is what is aimed at, not mere understanding of its meaning, but it would be beyond the scope of this paper to argue this point.)

VIII

Both sides in the dispute appeal to a general theory about language acquisition. We learn a language invariably by acquiring knowledge of

word-meanings given in the context of sentences whose meanings are also known or given. A child learns his language in this way by observing the linguistic and other behaviours of the adults. The older adult (*uttamavṛddha*) commands something to the younger adult (*madhyamavṛddha*) who acts to obey. 'Bring a horse', and a horse is brought. 'Bring a dog and tie the horse', and so it is done. That is how our acquisition of the meanings of individual words is explained. The Bhāṭṭa says here that there is thus the denotative power in the individual words, to give us isolated objects, actions, qualities, and relations (i.e. meanings). Hence given any newly formed sentence we can derive its meaning following the 'expected' syntactic pattern (*ākāṃkṣā*) by computing and manipulating such individual meanings to construct a whole. But the Prābhākara disagrees. He says that since individual word meanings are derived only in the context of some sentence or other and therefore from words already syntactically connected with other words, we learn such word-meanings along with their possible (semantic) connections with other word-meanings. The denotative power of a word gives us not simply the object, or action, or quality or relation but also each item's possible connection with other items. Hence being presented with a sentence we do not waste time by first computing meanings from words and syntax and then manipulating such meanings into a whole, but straight away: we derive the connective meaning whole, objects with action, quality with the qualified, and a relation with a relatum. We shall first discuss one of the arguments usually given in support of the Bhāṭṭa view.

Sentences are innumerable, but the word-lexicon has a manageable size. The logic of parsimony demands that it is the word that should be endowed with the designative power (*śakti*), not the sentence. Consider the following four sentences: 'Bring (a) cow', 'Bring (a) horse', 'Tie (a) cow', 'Tie (a) horse'. The child's ability to learn the language is facilitated by learning the four *words* (Sanskrit does not use articles) and their corresponding meanings (real elements of the world) as opposed to learning the four sentences and their corresponding meanings. Add a word 'black' to each of the four sentences and see that by learning five words we can interpret eight more combinations. We can also better explain our ability to interpret new

combinations which we have never heard before, such as new poetical compositions by a poet. Moreover, if there are several unfamiliar words in a sentence, we cannot cognize the sentential meaning. Using such and other arguments, the Bhāṭṭa repudiates Bhartṛhari's sentence-holism.

Against the Prābhākara, however, the Bhāṭṭa argues as follows. If isolated, atomic word-meanings are like the discrete points of distinct iron pins (*ayaḥśalākā*), how could they constitute a continuous line representing the unity of the sentential meaning? For obviously the separate elements being independent of each other, cannot naturally *merge* into each other to form the continuous line. The Bhāṭṭa's answer is that it is done through *ākṣepa*, that is, an extrapolative judgement (when word-meanings are individually cognized), or a sort of suggestive inference (*arthāpatti*) on the part of the hearer.

A few words to explain *ākṣepa* or *arthāpatti* may be in order. When what is presented seems incomplete to us we are forced to imagine some suitable additional (unrepresented) element for completion. This is called *ākṣepa.* By looking at a baby in a cradle one may imagine by *ākṣepa* that there is a mother who is around. *Arthāpatti* has a slightly different meaning. It is a proper inference from the given data. If I see that my desk is no longer in this room, I can easily infer that it has been removed (otherwise it would be impossible to explain such absence of the desk from the room under the circumstances). It is argued that our knowledge of the missing connectors between two word-meanings is suggested by such 'extrapolation' or 'inference'. Each of the words gives some independent *object* as its *complete* meaning and then since they are in a sentence together (*āsatti*) along with syntactic expectancy (*ākāṃkṣā*) and semantic fitness (*yogyatā),* we infer these appropriate connections to obtain the connected meaning of the sentence. Notice that the Bhāṭṭa plays down the logical role of *ākāṃkṣā* or syntactic expectancy. Or, he might have regarded it as simply a psychological factor. The Naiyāyika, who is the third party in this atomistic framework, emphasizes, however that the interconnection between word-meanings is derived from the 'syntax', that is, from *ākāṃkṣā*, which is

defined (non-psychologistically) as the interconnectedness, order, etc., of the elements of representation.

Here the basic issue seems to touch the well-entrenched disputed area where we sometimes talk about interdependence or one way dependence between different elements or constituents (subject and predicate, proper name and general term, noun and verb) that seem to form a unity in a proposition. The Bhāṭṭa says that the designata of words are unrelated objects and hence to connect them we need a presumptive judgement (inspired by the psychological factor 'expectancy'). On the second (Prābhākara) view the word's *designative* power extends to a designatum *plus* possible linkages with others. The word means the *related* item. Here the same underplaying the importance of syntax is noticeable. The unity of the sentential meaning is guaranteed here by the *semantic contribution* (an object plus possible relation) of the words themselves. There is no need for additional suggestive inference or extrapolative judgement to cognize this unity. The Bhāṭṭa argues in reply that on the Prābhākara theory we cannot explain satisfactorily our prompt understanding of the meaning of many new sentences which we have never heard during our days of language-learning. We may note that due to similar misgivings the 'composition' principle is thought to have some edge over the 'context' principle.

IX

It has been suggested that the Prābhākara theory of 'related designation' is an extreme form of syncategorematism.[10] The question is: does the strong context principle 'words have meanings only in the context of a sentence' necessarily entail syncategorematism? Usual examples of syncategorematic words are grammatical particles, adverbs, prepositions, etc., 'sake' in 'for the sake of', to take a typical case.

Using the older idea of a term, one can say that a syncategorematic word is one which cannot be used as a term independently but only in conjunction with other word or words. Quine[11] extended the notion to

include certain adjectives, 'little elephant', 'little butterfly', 'poor violinist', and 'true artist'. In these cases, the qualifying words may have some independent meanings, but they are largely irrelevant, and from the meaning of combined phrases, meanings of such words are not (easily) separable.

Recently Paul Gochet[12] has argued that Quine on the whole prefers a syncategorematic treatment of predicates or general terms. And even if we deny this generally, we have to admit that some (at least one) predicates are syncategorematic (example '*a*', & '='). An extreme form of syncategorematism, it appears, would have to be a claim that all words are like this. On a milder interpretation, syncategorematism may be a vague way of underscoring the later Wittgensteinian claim that the meaning of a word is the *use* it has in language. Does the Prābhākara view come somewhat close to such a position? There is an obvious difficulty here. It is important to see the contrast. Wittgenstein's motivation was to move away from the idea that our talk of the meaning of a word is a talk of the object it stands for, or the entity with which it is somehow correlated. The Prābhākara's main concern was to account for how the constituent word-meanings, if they are given in isolated forms, could be *linked up, hooked up*, with one another in order to form a unity. In fact, one way to describe the Prābhākara view is to say that for him such a word's semantic value is 'an object with a hook (to pick out another object)' so that two or several of them in a sentence can naturally cling together to form a whole. Besides, if admission of syncategorematic words in language presupposes presence of *categorematic* words in combination with which they would form meaningful units, then this is not the view of the Prābhākara. For him, each word needs another to form a meaningful unit. In fact, this general point can be used as a criticism of the strong context principle, if it is construed wholly in the syncategorematic way. We must note that while both the Prābhākara view and at least some version of the context principle may tell us that the meaning of a word is the contribution it makes to the meaning of a sentence in which it occurs, the 'context' principle requires that *a word unconnected with other words cannot have a meaning* while the Prābhākara

requires that *a word cannot have such a meaning as is unconnected with the meanings of other words.*

X

We shall now present the argument of the Prābhākara in defence of his theory. The Bhāṭṭa argues that the Prābhākara by making all word-meanings 'context-sensitive' faces a dilemma. Consider a two-word sentence: 'XY' meaning a connected unity. If we ask what meaning is conveyed by 'X' we have to answer that if it conveys any meaning at all then it conveys the unitary meaning of 'XY' itself. And the same is the case with 'Y'. This is so because the Prābhākara has claimed that the meaning of the word of a sentence contains within itself, though implicitly, the whole sentence-meaning, that is, the connected meaning. This seems to amount to sentence-holism. But the Prābhākara maintains that sentences are made of parts which are words and if the meaning of one part contains the meaning of the whole, the other part becomes redundant. Hence the dilemma before the Prābhākara: either redundancy or sentence-holism.

The Prābhākara answers that the word 'cow' in the sentence 'Bring a cow' or 'The cow is white' designates a cow along with the possibility of its linkage with all other possible objects, or a cow with all the possible qualities, modalities, and actions, and the second element in the sentence is necessary *only* to help us determine which *particular* linkage to the exclusion of all other possible linkages is to be taken into account.

But this is not enough. For one thing, if by the utterance of the word 'cow' one becomes aware of the cow linked up with all the possibilities (but no specific linkage is given) one is in effect aware of specifically nothing at all. It is an incomplete, and hence a very vague, awareness of meaning. (For a thirsty person a salty ocean is no better than a dry dreary desert. This analogy is from Jayanta. Knowledge of the object with all possible linkages is equal to no knowledge at all!) A dilemma arises again: (*a*) if the second word is necessary, is it so by its mere presence? If so, we again embrace

sentence-holism. (*b*) Is it necessary because it *contributes* its own meaning to the whole? If so, it resolves into the Bhāṭṭa view: words give their meanings first and then the sentential meaning is derived from them.

To escape between the horns of this dilemma, the Prābhākara proceeds as follows: first he concedes that the expression 'a cow' means the object cow with infinite possibilities of linkage and the function of the other phrase 'bring' or 'is white' is to exclude other possibilities except the particularly intended one. The second phrase performs this function by its *mere presence*, not by contributing its own meaning. This is not sentence-holism. For holism demands that the combination as a whole has the *combined* (whole) *meaning* where contributions of individual elements are not *recognized* at all, *save through an artificial analysis*. But the Prābhākara theory recognizes that the second element's contribution lies only in excluding all other possible combinations save one that is intended by the sentence.

Jayanta explains the point with the help of several analogies. Cooking is the result of many factors: burning of wood, a pan holding water, etc. They all individually contribute to the combined effect, *cooking*, by performing their own functions which can be individually recognized. Similarly the unitary knowledge of the meaning of a sentence is the result of the interrelated but separately recognizable functions of its constituent words.

A wagon moves and each part is also moving. We can only *recognize* separately the mutually connected function of each part but all such parts jointly produce the motion of the wagon as a whole. The functions of such parts (or their motion) are not separable in reality. Similarly our knowledge of the meaning of a sentence is *produced* by the interrelated function of the constituent words. We can of course *recognize* the unconnected 'own' meaning of each constituent word just as we can observe the individual functions of all parts of the moving wagon, which cause it to move. But such functions do not have separate existence outside the context. We may be reminded here of an already noted comment by Dummett: in the order of *recognition*, the sense of the word is primary. But the point here straddles between both epistemic and ontological concern. Unconnected word-meanings can be recognized but it would be wrong to construe them as

separate entities. Each of them can play a role only in combination with others. The Bhāṭṭa makes a mistake of construing them as separate reals and identifies them with the (material and immaterial) objects such as a pot, blue colour, and action.

More generally, combination of factors produces a combined effect and each factor in combination produces its own *effect*, which is discernible only in that combined effect. The designative power of a word becomes manifest only in combination with other words or only when it is placed in its *natural home*, a sentence (one word sentences being allowed). A word may *remind* us of an isolated independent object, but to contribute to the sentence-meaning it must *mean* directly an object with a linkage. To put it bluntly, on the view we are considering, a word does not *mean* an isolated object, although it may *remind* us of such an object through associative psychological connection, while what it *means* is what it contributes to the sentence-meaning, that is, an object with linkage with others. In Jayanta's language:[13]

> A word does not *mean* a pure object. For we cannot find pure (isolated) words which are not functioning in combination with others. These words are not employed separately to give their 'own meanings' and then the meaning they have in combination with others. They are always used to give their meaning in combination with others. But when they are used in this way it is not that we cannot *recognize* their *own* function (or *own* meaning). Therefore the sentence cannot be a partless whole (nor can its meaning be so either), for the individual functions of the parts are recognized.

Thus, the Prābhākara believes that perils of holism can be avoided and drift towards extreme atomism can be stopped.

XI

Let us see whether we can tie up some of these different issues together. The context principle may be taken to be a very general thesis about meaning, and as a general thesis it would oppose what has been called *epistemological atomism*.[14] This is the view that at least some objects are 'given' to us in sense perception or intuition—and hence our knowledge is in the first instance knowledge of isolated objects (and their properties). This view would then construct the meaning (sense or reference) of complex expressions (sentences etc.) in terms of those sense-perceptible *givens* or the isolated objects. In *Der Gedanke*, Frege seems to have rejected this view impressionistically. Perception of objects, he said, involved grasping of thoughts. It is not to be confused with pure sensory reaction. Knowing is always *knowing that.* The context principle, viewed as a general thesis of meaning, would also oppose such atomism. This undoubtedly offers some insight into our discussion of the Prābhākara theory which opposes a similar sort of epistemological atomism of the Bhāṭṭa school.

Kumārila Bhaṭṭa[15] cited the case of a perceptual judgement constructed out of the bits and pieces of the sense-given. We can take this to be another version of epistemological atomism, which is then extended to the philosophy of language to explain our knowledge of the connected meaning of sentences. Here is the example. Seeing a white flash moving swiftly and hearing the noise of the hoofs and neighing, one judges perceptually 'a white horse runs'. Here the bits of the sense-given are white flash, hoof-noise, and neighing, but a judgement that connects these bits together is reached through the operation of the mind. Similarly there is the operation of the mind which connects the bits and pieces of isolated meanings, to obtain the connected sentential meaning.

The Bhāṭṭa's point seems to be this. The bits and pieces of the objective world, i.e. the isolated objects themselves, possess the capacity (power) in themselves to stimulate the observer enough first to grasp the isolated objects and then to formulate a judgement that connects them together. There are presumably three constituent items in the resulting judgement. They are separable as (1) the white flash presented visually, (2) the notion of horsehood presented by the instant inference from hearing of the neighing,

and (3) the notion of running presented by the inference from the noise of the hoofs. These three are presented in three different ways (through three different avenues of knowledge, *pramāṇas*) and hence presumably they are grasped as unconnected bits of objects. Having been grasped they can by themselves evoke a judgement which unites them. This shows that a judgemental knowledge is possible simply on the basis of the presentation of the isolated object-atoms themselves. Similarly let each word in the sentence present the individual unconnected meaning (objects, properties, actions, etc.). When such isolated meanings are grasped, there will automatically arise the judgement of the connected sentential meaning.

The Prābhākara disagrees. The example, he says, is wrongly construed. There is no doubt that the three bits of object are separately presented in the given example, their sources being different in each case. But a connected judgement automatically arises in the person, as soon as he can locate all these three bits into one spatial location or in one particular substance, the horse. Śālikanātha following the Prābhākara argues that if the person is simply unaware or uncertain of the connectedness of the three bits, he would have three disconnected awarenesses: 'There is a horse there, something is white, and somebody is running.' But from the bits and pieces of the *given,* the required judgement, 'A white horse is running' arises since he can recognize both neighing and the action of running as belonging to the (same) substratum where the white flash belonged. Or, if he is *un*aware of the lack of connection of these objects he would have the required judgement. The judgement may finally be based upon knowledge of connected facts or, even lack of knowledge of the *dis*-connection of isolated bits. In the case of a sentence, the words themselves as constituents provide, by way of presenting their *meanings,* such connected facts, but since such connected facts and the sentential meaning are not different from each other, we know the sentential meaning directly from the knowledge of the words and need not go through the collection of (word-) meaning-atoms.

Śālikanātha was concerned with the epistemological question: how do we as hearers know the sentence-meaning with our usual linguistic competence (*vyutpatti*)? But it is by no means clear whether an ontology of

connected facts is conceded here by the Prābhākara. Perhaps not. What is asserted is rather that word-meanings properly understood are connected facts, not isolated, unconnected bits of object. For otherwise it would be impossible to derive knowledge of the connected sentential meaning from unconnected bits. To imagine any additional device as the Bhāṭṭa does, for providing the required connection between isolated objects would be going against the principle of parsimony.

The Prābhākara points out that the Bhāṭṭa may be violating the principle of parsimony in more than one way. The Bhāṭṭa imagines first that the words have one kind of dispositional property, that of being able to produce in the hearer the cognition of their 'own' (individual) meanings. Second the word-meanings themselves (objects, properties, actions) should then have the disposition to generate the hearer's cognition of the linkages among themselves. Moreover, the words must have another dispositional property for producing in the word-meanings such a (second) dispositional property as would be capable of generating the cognition of the linkages. So the Bhāṭṭa view implies that there should be in all three dispositional properties, two in the word itself and one in the word-meaning, in order that we can account for the verbal cognition of the whole sentence meaning satisfactorily. If, however, we agree, along with the Prābhākara, that words themselves have a dispositional property—that of producing in the hearer a cognition of their 'own' meanings plus linkages—then we can practice the desired *economy* of dispositional properties (one instead of three). Besides, when we deal with language we can never find a word that is *only* a word being completely isolated from other words, for at the end some sort of word such as 'is' or 'exists' will be understood always when one word is uttered or heard. Hence a cognition of its meaning will necessarily bring in the linkage, its connection with the meaning of the other word through association.

The dispute between the two groups rolled on for several centuries. Their arguments and counter-arguments became increasingly subtle and technical. At some point, the exponent of the Prābhākara conceded that the isolated meaning of the word without the linkage can very well be *recollected* by the

hearer as soon as the word is heard. And this facilitates our language learning procedure. The Prābhākara confirmed: the isolated meaning, the object cow, from the word 'cow', is quickly recollected because of *intensity* and *recurrence.* But this recollection simply facilitates our awareness of the proper meaning of the word in the context; we become aware of the object cow plus its possible relation, and the second awareness yields the knowledge of the connected sentence-meaning. With this concession, it was claimed that it became a more defensible theory about meaning, which avoided the problem of sentence-holism as well as that of 'unconnectedness' which the extreme forms of atomism might imply.

If connected facts are not admitted as real entities 'out there' but at the same time it is claimed that words in a sentence designate connected items, that is, objects with linkage, and not objects as such, then this 'designation' relation of words is supposed to pick out what we may call *epistemic* objects, not the actual items or objects in the domain of the reals. It is our knowledge of such a 'designation' relation of words that gives us the knowledge of the sentence-meaning as a whole. This seems to call for a tentative distinction to be made between the isolated objects, the *ontological* domain, and what we call a *semantic* domain which will include designata of words, such connected facts, the *epistemic* objects, that is, objects with linkage. We are not however sure whether the Prābhākara would be accepting this consequence, but this seems to follow from his view.

Dummett repeatedly says that the context principle as applied to reference (as applied to sense, the principle seems to him unproblematic) created a *tension* in the kind of realism that informs Frege's whole philosophy. The Prābhākara view is an attempt to avoid a *crude* theory of meaning, which demands that the meanings of our words be construed as independent and isolated pieces of reality. We have shown that the Prābhākara can avoid this construal and still maintain realism in his ontology by confining his doctrine of meaning to epistemological level; it becomes an epistemological thesis about the origin of our knowledge of sentence-meaning. The moral seems to be this. If we flout the context principle, as well as the Prābhākara view of connected facts as word-

meanings, we are hard put to explain how we recognize the connectedness of these individual atoms in our judgements. In fact, this will be a general problem for any form of atomism, epistemological or ontological.

To conclude: it is obvious that the context principle was formulated to answer presumably a different set of questions, but some of the philosophical issues raised by it were not entirely different from the issues raised by the age-old controversy between the Bhāṭṭa and the Prābhākara about how we grasp the (whole) meaning of the sentence. Among other things, Frege was concerned with the dismissal of the psychologistic interpretation of number-entity. That was apparently not the concern of the Indian philosophers we have talked about. It is however not clear whether Frege was making an epistemological point about how we grasp thoughts, or an ontological point about the parts in the context of the whole. He did seem to worry at times about how the whole manages to hold together. The Prābhākara, on the other hand, explicitly makes an epistemological point about how we grasp the sentence-meaning. By positing such semantic or epistemic objects as things, properties or actions with possible linkages, constituting the domain of the meaning of words in a sentence, he steers clear of the two extremes: the Scylla of crude realism implicit in the extreme atomism of the Bhāṭṭa and the Charybdis of a sort of idealism implied by Bhartṛhari's holism.

Appendix

1. On page X of *The Foundation of Arithmetic* (J. L. Austin's translation) Frege writes: 'Never to ask for the meaning of a word in isolation, but only in the context of a proposition.' The principle is here laid down as one of the three principles Frege says he has kept to in his enquiry in the book. So it

does seem that the principle is laid down as a *methodological principle* (or a *heuristic device*). He explains, after laying down the principle, that a violation of this principle forces one to take mental pictures or acts as the meanings of words, and thus to a violation also of what is now known as anti-psychologism. (The three principles which are laid down by Frege in the *Introduction* are anti-psychologism, the context principle, and the object-concept distinction.)

2. In Section 60, p. 71, Frege says: 'Only in a proposition have the words really a meaning.' Here, the principle is invoked to argue that from the fact that we cannot form a (separate) idea (i.e. mental picture) for a number word it does not follow that it does not have any meaning. Thus he adds: 'It is enough if the proposition taken as a whole has a sense; it is this that confers on its parts also their content.' It is very significant however that in the *second part* of the sentence Frege speaks like a (sentence-)*holist*: it is the sense of the sentence which confers on the words the content which they have.

3. Two pages later, in Section 62, p. 73, Frege talks again of the context principle in the same manner.

4. Frege refers to the context principle again towards the end of the book, while giving a resume of his investigations in the *Foundations*, in Section 106. On page 116 he writes the following:

> We next laid down the fundamental principle that we must never try to define the meaning of a word in isolation, but only as it is used in the context of a proposition: only by adhering to this can we, as I believe, avoid a physical view of number without slipping into a psychological view of it.

Reference to the idea of definition in context seems to suggest the case of contextual definition of words and sub-sentential expressions. Wittgenstein's own form of the context principle was inspired by the second and third formulations in Frege. In 3.3 of the *Tractatus* he writes: 'Only propositions have sense; only in the nexus of a proposition does a name have meaning.' Wittgenstein uses two terms in German while expressing the context

principle—'Sinn' and 'Bedeutung'—and the first in connection with propositions (sentences), while the second in connection with names. If this is taken really seriously, we can take Wittgenstein to have said that the sense is something which belongs to the sentence, and not to the words, not especially to names; and the names have reference, as opposed to sense, but the reference of the name is determined by the sentential context in which it occurs. If there is anything in this interesting idea, what Wittgenstein advocated in the *Tractatus* must be very different from what the context principle is taken to say in any of its interpretations we have discussed, and for which we have any textual evidence.

* We benefited from conversation with Michael Dummett at a seminar given by us in Oxford in 1984. We wish to thank also the following persons who read the paper at its various stages and made important comments: Peter Strawson, Michael Resnik, and Simon Blackburn.

4 We apologize for introducing two rather formidable Sanskrit terms at the outset. We have given literal translations of the two terms here. They are ascribed to the two philosophers of the Mimamsa school, Prābhākara and (Kumārila) Bhāṭṭa. Later we propose to use these two proper names to refer to these two rival views.

5 'On Denoting', *Mind*, 1905, pp. 479–93.

6 This aspect of Frege's use of the contextual definition is brought out extremely well by Crispin Wright in his *Frege's Conception of Numbers as Objects,* Aberdeen University Press, 1983. But Peter Milne (*Mind*, 1986, pp. 491–6) is right in saying that the context principle cannot be exhausted by Crispin Wright's *syntactic priority thesis*, that is, by the thesis that if an expression has *all* the syntactic features of a singular term, and we can give sense to the sentence as a whole, then we can say that the singular term stands for an object, even if there is no *independent* evidence for the existence of such an object. (For one thing, expressions other than singular terms must be brought within the scope of the context principle; and, for another, the principle should not be assumed to concern *reference* alone of expressions, it can concern their *sense* as well.) However, the point which Milne himself makes, namely that the context principle was taken by Frege (in his pre-sense/reference thinking which was at least partially retained even at the time of writing *The Foundations*), to give an account of identity statements in terms of a shift of reference from the object to the sign, cannot add anything to a specification of the *content* of the context principle. It only tells us something about what this principle was taken to explain. Besides, it is both desirable, and possible, to find out some interpretation of the context principle which can survive the sense/reference distinction.

7 We believe that it is a mistake to suppose that the principle applies to unsaturated expressions alone. For, to be sure, the context principle, according to Frege, should apply to *all* expressions. Resnik has added another reason (private correspondence): unsaturatedness is only needed after

sentences are given parts that have separable meanings, while the *strong* context principle would imply that parts of the sentence may not have separate meanings.

14 See M. Dummett, *The Interpretation of Frege's Philosophy,* London, 1981, pp. 345–59. The term is used by Sluga.

15 The discussion here centres around a frequently quoted verse of Kumārila Bhaṭṭa. We follow the explanation by Jayanta and Śālikanātha.

The Sense-Reference Distinction in Indian Philosophy of Language

Mark Siderits

It is generally accepted that Indian philosophers of language do not posit sense as a component of the meaning of an expression in addition to its reference.* There is, for instance, no notion of analyticity – of propositions which are true by virtue of meaning alone – in Indian philosophy. Likewise no distinction is drawn between contingently and necessarily nonexistent objects: Two stock examples of a nonexistent are the horns of a hare and the son of a barren woman, and these two examples are treated as in all respects alike. We find instead a more or less pure reference theory of meaning: The meaning of an expression is that entity which the expression designates. Here the name-bearer relation seems to reign supreme as the central metaphor of semantics. I shall, however, argue that, predominant though the reference theory might be, certain Indian philosophers of language were nonetheless forced to recognize sense as a distinct element in meaning. That the sense-reference distinction was never extensively made use of by Indian philosophers of language is clear; I shall not be concerned to dispute this or attempt to explain it. Instead I wish to explore how recognition of something sense-like is forced on philosophers working in a tradition dominated by semantic realism. I suspect we may discover something important about the motivation behind the sense-reference distinction through such an exploration.

1.

We would do well to begin with the sense-reference distinction as it is employed in the Western tradition. Here, the distinction appears to have originated with an attempt to account for differences between the semantic behavior of proper names and so-called general terms. While the proper name 'Aristotle' might be said to have as its meaning its bearer or referent, Aristotle, it seems odd to say that the meaning of 'human' is the class of humans. Instead, such thinkers as Reid, Whately, and Mill held that the meaning of a general term is a property or set of properties: Such a term denotes the members of its extension by virtue of this descriptive backing or connotation, and to predicate a general term of a particular is to convey the information that the particular has that property or set of properties. It is now generally accepted that nonempty proper names have reference and predicative expressions have sense. With respect to the latter, one widely held view is that a sense is an idea or concept, a purely mental representation which a competent speaker associates with a term. This tendency to see senses as mental contents is no doubt often motivated by nominalist scruples about allowing properties into one's ontology; but it may also reflect the intuition that an adequate account of the meanings of predicative expressions must somehow be made to fit into the general scheme of propositional attitude psychology.

It was Frege who first claimed that all meaningful expressions – singular terms, predicative expressions, and sentences – have both sense and reference. The claim that proper names have senses has been the subject of much controversy, but it is generally conceded that Frege's puzzle about identity statements must somehow be answered: The statement, 'Hesperus is Phosphorus' is informative, yet if the meanings of the names 'Hesperus' and 'Phosphorus' were just their referents, then the statement should be no more informative than 'Hesperus is Hesperus'. Thus it appears unarguable that part of the meaning of a proper name is the information value it has, the contribution it makes to the cognitive content of a sentence in which it occurs. What is far more controversial is Frege's identification of this aspect

of the meaning of a proper name with a distinct notion, that of the means a competent speaker employs in identifying the referent of a proper name. In particular, Frege is often alleged to have held that the meaning of a proper name is that one definite description that any competent speaker must associate with the name. Here the root issue appears to be whether understanding a proper name involves having a theory about its referent: Must we ascribe propositional knowledge of any sort to the competent speakers of a language to explain their use of a proper name? Those who deny that proper names have senses would of course agree that there is something that fixes the reference of a proper name, but they deny that a competent speaker need have any conceptual representation of this reference-fixing device to use the term; one need not have in mind any explicit or even implicit theory about the referent to know the meaning of a proper name.

This approach leaves unanswered Frege's original question about the informativeness of identity statements involving proper names. One possible solution involves what McDowell[1] calls an austere theory of sense: The statement,

> 'Hesperus' denotes Hesperus

states the reference but *shows* the sense of 'Hesperus'. To satisfactorily interpret the behavior of speakers of the language, we must ascribe to them knowledge of this proposition, as opposed to, say, the knowledge that 'Hesperus' denotes Phosphorus. Here there is no pretense that the competent speaker need have any theory as to how he or she picks out the referent of 'Hesperus' – it is possible that this feat can be explained in terms of purely neural machinery. But such machinery cannot explain all the facts about speaker behavior: In particular, it does not explain the fact that certain speakers use the statement, 'Hesperus is Phosphorus' to express more than just a truism.

Our goal in this section is not to find a workable solution to the problem of the semantics of proper names, but rather to determine what is generally meant by the sense-reference distinction. Frege's description of sense as the

mode of presentation of reference is suggestive but unclear. What emerges from the controversy over proper names is that sense involves propositional knowledge or knowledge-that, as distinct from mere associative knowledge.[2] The champion of senses for proper names insists that we cannot adequately explain speaker's behavior unless we take the speaker to associate name with bearer in some particular way, a way that can only be expressed in terms of propositional knowledge. There is disagreement as to what such knowledge might consist in – a definite description, or fuzzy set of definite descriptions, or the bare knowledge that 'Hesperus' denotes Hesperus. But such theorists hold in common that to understand the use of 'Saul Kripke' in a sentence is to be *en rapport* with Saul Kripke in a particular way, a way that is different in kind, by virtue of its having some information content, from the manner in which one is *en rapport* with Saul Kripke when one sees or touches him; and which may also differ in content from the way one might think of Saul Kripke in understanding the name, 'little Saulie from grade school'.

Frege's claim that predicative expressions have both sense and reference is controversial for the opposite reason: It is generally agreed that such expressions have sense, but the notion that they have reference is widely disputed. For Frege, the referent of the expression, 'is a prime number' is a function that maps objects onto truth-values (onto True for the prime numbers, onto False for all other objects); the sense of the expression is the manner in which any competent speaker grasps this function. Frege seems to have thought that such a distinction is called for at least in part because, in the case of two coextensive predicates, one may grasp the functions associated with the terms in different manners, such that one is competent in the use of each (intuitively, 'knows their meanings'), but does not recognize their extensional equivalence. The notion that predicative expressions have reference has been resisted because it seems to some ontologically profligate to add unsaturated or incomplete entities to the realm of reference (i.e., the world) when it is generally agreed that a competent speaker must have some criterion of application in mind in order to use a predicative expression: Why posit such strange entities when we can explain speaker behavior

solely on the basis of knowledge of the senses of such expressions? (Frege held the referent of a predicative expression to be an unsaturated entity – a function with its argument-place(s) unfilled – where others, such as Strawson and C. I. Lewis, would take it to be a universal or property; Frege's choice was dictated by his application of the context principle to the problem of sentential unity, about which we shall say more below.)

Once again, we are concerned not to settle the dispute, but to see what it tells us about the sense-reference distinction. Here too we find that senses have cognitive content – they hook up somehow with a speaker's propositional attitudes. To know the sense of a predicative expression is to have some piece of propositional knowledge that one uses in determining the truth-conditions of sentences in which it occurs. Here as well we can envision more and less austere versions of a theory of sense. But if Frege is right then we must attribute some such propositional knowledge to the speaker, in addition to the mere ability to employ the function (which, again, can be explained in terms of purely neural machinery), if we are to account for speaker behavior.

I wish to show how certain Indian philosophers, working within a tradition dominated by the reference theory, came to posit sense as a distinct component of meaning. I shall present two episodes in Indian semantics. The first occurs within a nominalist school, the Yogācāra-Sautrāntikas of the Buddhist tradition. Here we shall find the philosopher Dharmakīrti responding in the normal nominalist's fashion to the realists' use of universals to explain the semantics of predicative expressions. However, his reasons for positing sense are not what we might expect, for the semantics he develops yields a reference for a predicative expression, namely, that part of its extension that it denotes in a sentence in which it occurs. That is, Dharmakīrti does not follow the well-trodden route from rejection of real universals or properties to mental representations as the meanings of predicates. Instead, his account of our application of predicates leads him to take the particular as the referent of such a term on an occasion of use. It is only when faced with the difficulty of explaining how a statement asserting two predicates of the same particular can be informative that he is forced to

distinguish between the referent of an expression and another component of its meaning, its cognitive content or sense.

The second episode occurs within the Prābhākara Mīmāṃsā school of orthodox Indian philosophy. This school accepts an ontology sufficiently rich that an appropriate referent can readily be found for each kind of term in the lexicon: substances for proper names, property-particulars for adjectives, actions for verbs, universals for natural-kind terms, etc. Thus here too it is not ontological scruples of the usual sort that lead the Prābhākaras to the threshold of the sense-reference distinction; in this case it is their adherence to the context principle, the principle that only in the context of a sentence does a word have meaning. What I shall seek to show is that their application of this principle to the process of sentence comprehension leads them to distinguish between the entity denoted by a term and the manner in which one becomes *en rapport* with that entity through understanding the term. This, I shall argue, is tantamount to the sense-reference distinction as described above. Of particular interest here is that the Prābhākara theory yields what I take to be a more plausible motivation for the sense-reference distinction as applied to predicative expressions than that which Frege provides.

2.

In his remarks on inference in *Pramāṇavārttika*,[3] the Buddhist logician Dharmakīrti says something that is clearly relevant to our investigation. According to the Buddhist logicians, an inference has the following basic structure:

> *x* is qualified by *P*
> because *x* is qualified by *R*.

Here *x* is an entity or set of entities, *P* is a property which is meant to be proven to qualify *x*, and *R* is some property (the 'reason') which is asserted

to be an indicator or mark of the presence of *P* in *x*. The example which Dharmakīrti discusses is this:

> This is impermanent
> because it is a product.

About this inference Dharmakīrti makes the following claim: For any entity which is a product, its productness is ultimately nondistinct from its impermanence. The reasons for this seemingly odd claim are to be found in certain basic tenets of Yogācāra-Sautrāntika metaphysics. According to this radically nominalistic school, only unique particulars exist. There are no universals or properties, and there are no resemblance relations among particulars. It is concluded from this that a property is ultimately nondistinct from the particular that possesses it. It would then follow that whenever two properties are properly predicated of a particular, those properties are themselves nondistinct.

Now granting all this, let us look at the difficulty which Dharmakīrti's claim creates for his account of this inference. It is objected that such an inference must then commit the fallacy known to Indian logicians as 'reason as part of the meaning of the thesis'. In our example, the thesis is, 'This is impermanent', and the reason is 'product'. Clearly, the objection is that here 'impermanent' and 'product' have the same meaning, referring as they do to identical properties, so that the inference could be reformulated as:

> This is impermanent
> because it is impermanent.

Thus the inference is question-begging. Now we might be tempted to say in response that the inference is nonetheless valid if productness and impermanence are identical. It is not open to Dharmakīrti to reply in this fashion, however, since his concern is to show that inferences of this sort are valid means of knowledge (*pramanas*), and a cognitive act cannot count as a valid means of knowledge unless it results in cognition of a proposition not previously known to the cognitive agent. Thus the thesis of a true inference

must be a proposition which the inferrer does not yet know to be true; and in order to perform a question-begging inference, one must already know the thesis to be true. The objection, then, is tantamount to the claim that, given Dharmakīrti's description of inferences of this sort, all such inferences are uninformative.

The parallel with Frege's puzzle concerning the informativness of certain identity statements should be clear. It is alleged that when the sentences,

(1)　This is impermanent

and

(2)　This is a product

are both true, the referent of 'impermanent' is the same entity as the referent of 'product', viz., the entity demonstrated by 'this'. On the assumption that meaning is just reference, (1) and (2) should not then differ in meaning, so that the inference in question should not be informative. But it clearly is informative.

And just as the puzzle parallels Frege's, so will the general outline of the solution: Dharmakīrti's strategy will be to attack the assumption that meaning is exhausted by reference. But my aim here is not simply to point out that Frege was anticipated by some twelve centuries. The senses that the Buddhist introduces will turn out to differ in important respects from Fregean senses. To see this, though, we must first examine the semantics that Dharmakīrti develops to account for our use of predicative expressions.

The Buddhist nominalist is faced with the standard difficulty of explaining how, in the absence of real properties, it can be true of this piece of paper that it is a product but false of it that it is a cow. The solution proposed by Yogācāra-Sautrāntika is to be found in the *apoha* theory of Buddhist semantics. According to this theory, the meaning of the general term 'cow' is given by the formula 'not noncow'. This is proposed as the nominalist alternative to the semantics of such Indian realists as the Naiyāyikas, who maintain that the meaning of 'cow' is the universal cowness which inheres in each of the infinitely many particulars that are

cows. Thus the *apoha* theory is meant to provide a way of characterizing all and only those particulars belonging to the class of cows without commitment to the existence of any property or set of properties common to the members of the class. This theory may be represented formally as follows. Associated with each term t is some one particular p_c. Then with p ranging over the domain D of particulars, the meaning of a term t is $\hat{p}(\sim -p_c p)$ (read: p such that it is not non-p_c). The $\sim -$function yields a pseudo-predicate when it takes particulars as arguments. This function may be analyzed in terms of the two types of negation of which it is composed – verbally bound (*prasajya-pratisedha*) and nominally bound (*paryudasa*). For each p in the domain D, $-p$ yields an ordered pair of sets, $\langle S_1, S_2 \rangle$, with S_1 the extension of $-p$ and S_2 the anti-extension of $-p$ (i.e., $S_1 \cup S_2$ is a proper subset of D; cf., choice negation). For each p_i, S_2 is a set with just one member, namely p_i. Application of verbally bound negation to this pair yields a pseudo-predicate whose extension S_3 is the complement of S_1 (i.e., $S_1 \cup S_3 = D$; cf., exclusion negation). We call this a pseudo-predicate because its extension has been determined in such a way as to avoid commitment to the existence of any characteristic or set of characteristics common to the members of S_3.

This theory has the following psychological model. The variable p ranges over mental images. A mental image is a sort of inner representation which may be caused either through perceptual cognition, or through cognition of the appropriate word once the conventions governing the use of that word have been learned. Given that both external particulars and mental images are absolutely unique and devoid of resemblance relations, one wonders how such conventions could be learned in the case of class terms. Consider the term 'cow', and suppose its extension to consist of images $p_1, ..., p_i$, each of these images being the sort of representation that would be caused were one in the right type of cognitive relation to what is commonly called a cow. Now an image, say p_1, manifests itself to consciousness in such a way as to be incompatible with or exclude the occurrence of a certain set of images which might otherwise occur, say the set $(p_{i+1}, ..., p_k)$. (Here $D = (p_1, ..., p_k)$.) Assume that the particular image p_c associated with the term 'cow' is p_1. This association comes about through p_i having been the representation

produced on the occasion of learning the term. Now $-p_1 = \langle (p_{i+1, ..., pk}), (p_1) \rangle$. Verbally bound negation is to be interpreted as absolute rejection of a set of images as a qualifier of a given image without commitment to the existence of some alternative qualifier as qualifying the given image. Thus to say of some representation p that it satisfies not non-p_1 is just to deny that it is a member of the set $(p_{i+1}, ..., p_k)$. But given that verbally bound negation functions like exclusion negation, this also means that the image in question must belong to the set $(p_{1, ..., pi})$. Thus the expression '~-p_1' is a way of characterizing all those representations which belong to the (direct) extension of the term 'cow', a way which does not make use of the notion of a real property of cowness.

How, then, does one respond to the command, 'Fetch a cow'? Having learned the relevant convention for 'cow', one knows that the word refers to anything which satisfies the pseudo-predicate ~- p_1. Now when we stand in the right cognitive relation to a real cow-particular, this causes the occurrence of a representation which satisfies the pseudo-predicate, since each cow-representation is endowed with the causal capacity to exclude the set of images $(p_{i+1}, ..., p_k)$. Thus we can recognize any representation from the set $(p_2, ..., p_i)$ as belonging to the (direct) extension of 'cow' simply by noting that the recollected image p_1 (which in effect serves as a paradigm) does not exclude that representation.

We can now see how an ultimately unique particular may correctly be said to be a product. We are also now in a better position to understand Dharmakīrti's claim that, strictly speaking, the productness of the particular is nondistinct from that particular itself. That about the particular which makes it correct to predicate 'product' of it is its capacity to produce a mental image which excludes certain other images. But this capacity of the particular is just an expression of the difference of the particular from all other particulars, i.e., its uniqueness. Now it is true that when we conceive of the particular as a product, we are not attending to its difference from all other particulars. There are, after all, certain particulars which are in neither the extension nor the anti-extension of the nominally bound negation of its image when that image is taken as an exemplar of 'product', namely those

other particulars which are products. As Dharmakīrti puts it, 'Words are ultimately based on just the particular, but they disregard the difference [of the particular] from everything else because they direct [attention] to just one difference.'[4] It is one difference which makes this particular a product, another difference which makes it a piece of paper. Dharmakīrti's point, though, is that we conceive of the particular as a product by disregarding its difference from those other particulars which are products. And our disregarding of that difference is, according to Dharmakīrti, a mere case of conceptual falsification. To recognize the productness of the particular is just to recognize its uniqueness – its difference from all other particulars – without attending to all of its differences. Hence at the level of ultimate truth, when we remove the results of all conceptual falsification, we are forced to say that about the particular which makes it correct to predicate 'product' of it is just its uniqueness, that is, the very particular itself.

We can now see why Dharmakīrti claims, first that both 'product' and 'impermanent' may properly be predicated of a particular, and second that the particular's productness and its impermanence are ultimately nondistinct. This brings us back to the original problem. It is, once again, alleged that the inference,

  This particular is impermanent
  because it is a product,

is not a valid means of knowledge, in that the reason 'product' is part of the meaning of the thesis, 'This particular is impermanent'. Dharmakīrti responds to this objection as follows:

> With respect to a single entity, there are as many exclusions as there are things with distinct forms. For that is different from the cause or effect which possesses the absence of that. And thus there are as many terms as there are exclusions, the terms having conventional meaning through exclusion by means of the effect and cause of that. Thus [the sentence], 'Speech is the immediate consequent of effort and the cause of hearing,' has meaning by virtue of excluding what is

not the effect or cause of that. Thus even though there be nondifference of essence [from property-possessor], that specific difference which is conceived of by means of some property or other cannot be conceived of by means of any other; it is not the case that all words are synonymous.[5]

The example of the term 'speech' is instructive. Any particular which is an instance of speech may be said to be both a product of effort and a cause of hearing. Thus for any particular instance of speech, the product-of-effortness of that particular and the cause-of-hearingness of that particular are essentially identical. We know, however, that the class of things denoted by 'product of effort' and the class of things denoted by 'cause of hearing', while overlapping, are not coextensive. Let us consider a world consisting of just ten particulars; that is,

$$D = p_1, \ldots, p_{10}.$$

Suppose, further, that

$$-(\text{product of effort}) = (p_1, p_2, p_3, p_4, p_5, p_6),$$
$$-(\text{cause of hearing}) = (p_5, p_6, p_7).$$

Thus we might have learned the meaning of 'product of effort' by noticing that the learning paradigm for this term produces an image which excludes the images produced by $p_1, \ldots, p_6$; and similarly for 'cause of hearing'. The extensions of these terms are, as usual, determined by the verbally bound negation of the nominally bound negation of the learning paradigm. Hence,

$$\sim\text{-}(\text{product of effort}) = (p_7, p_8, p_9, p_{10}),$$
$$\sim\text{-}(\text{cause of hearing}) = (p_1, p_2, p_3, p_4, p_8, p_9, p_{10}).$$

Suppose, further, that 'speech' denotes the particulars p_8, p_9 and p_{10}. Then an instance of speech such as the particular p_8 may correctly be said to be both a product of effort and a cause of hearing, occurring as it does in the relevant extensions.

Now one way of understanding the thesis that all reals are unique is that the essence of a particular is just its difference from all other particulars. Thus we might say that the essence of p_8 is given by its *verbally* bound negation:

$$\sim p_8 = (p_1, p_2, p_3, p_4, p_5, p_6, p_7, p_9, p_{10}).$$

Suppose that p_8 were the learning paradigm for one or another of the two terms 'product of effort' or 'cause of hearing'. If it were to serve as the paradigm for the former, then we would direct our attention to a proper subset of the extension of this verbally bound negation of p_8, namely $(p_1, ..., p_6)$. If it served as a paradigm for the latter term, then we would direct our attention to a distinct subset of the extension of this verbally bound negation of p_8, namely (p_5, p_6, p_7). Once again, Dharmakīrti does not take this fact – that the terms are applicable to the particular by virtue of distinct subsets of the extension of the total nominally bound negation of the particular – to show that the particular bears two distinct properties, product-of-effortness and cause-of-hearingness. When we, for instance, conceive of p_8 as a paradigm of product of effort, we do so not by attending to some feature of p_8 whereby it excludes $(p_1, ..., p_6)$, but rather by disregarding or over-looking the fact that p_7, p_9, and p_{10} also belong to the extension of its verbally bound negation. It is our failure to take in the entire exclusion class which makes it possible for us to view p_8 as a product of effort, not some special feature of p_8 itself. But the point which Darmakīrti is most concerned to make here is that the two subsets are distinct. Thus we cannot conclude from the fact that one of these terms is applicable to the particular that the other must be as well. And this, according to Dharmakīrti, counts as showing that the two terms must differ in meaning.

And now consider what happens when we have two terms t and t' which are in fact coextensive. In the above example we used an artificially small domain, but for most terms both the exclusion class and its complement (the extension of the term) are so large as to make it impossible to hold all their members before the mind at once. Thus in general we determine that a particular p_n belongs to the extension of t by noting that its

image is not excluded by the image of the learning paradigm for t. This means that we may know the learning paradigms of both terms, know that both terms are predicable of particulars p_m, p_{m+1}, p_{m+2}, know of no particulars of which one but not the other term is predicable, know that term t is predicable of p_n, but still not be able to determine from these facts alone whether t' is also predicable of p_n. Indeed this will hold regardless of whether t and t' differ in extension (like 'product of effort' and 'cause of hearing') or are coextensive (like, according to the Buddhist, 'product' and 'impermanent').

When a term t is correctly predicated of a particular p, its referent is just p. But our ability to assert t of p depends on some subset of the verbally bound negation of p being the same as the exclusion class determined by non-t. Dharmakīrti's first point in his response to the uniformativeness objection is that two terms t and t' may both have p as their reference yet differ in the subsets of p's verbally bound negation which they select. This counts, for him, as establishing a difference in meaning. His second point is that knowing this part of the meaning of t as applied to p need not even consist in being able to fix the boundaries of the relevant subset. It may consist in nothing more than knowing that p is like the paradigm for t in not being non-t – something we establish by seeing if the image produced by p is excluded by the paradigm's image. Thus it is possible to know what it would mean to assert two terms t and t' of p without knowing whether the subsets of p's verbally bound negation which they select are the same or different. This is why it is possible for one to know the meaning of 'product' and 'impermanent', know that 'product' is predicable of a particular, and not know whether 'impermanent' is also predicable of that particular. It follows that the inference in question is a valid means of knowledge, in that it can produce cognition of a previously uncognized proposition.

In effect, Dharmakīrti is here distinguishing between the sense and the reference of a predicative expression. As a nominalist working within a tradition dominated by the reference theory, it is natural that he should take as the referent of such a term that particular in its extension that is denoted on an occasion of use. *Apoha* semantics explains how this is possible, and in

doing so it turns the predicate into a kind of demonstrative, an expression whose referent in any occurrence is just a particular but which may be used to denote distinct particulars on different occasions. But the problematic inference shows that the meaning of such a term in a sentence is not just its demonstratum. In order for this inference to be informative, the sentences, 'This is a product', and 'This is impermanent', must somehow differ in propositional content when asserted of the same particular. The difference lies in the manner in which the particular is presented in the two sentences: in the first, by way of not belonging to the exclusion class formed by the paradigm image for 'product'; in the second, by way of the exclusion class for 'impermanent'. Now in fact these two exclusion classes are coextensive, but the competent speaker need not know this. (For the Buddhists this is an *empirical* discovery, which comes about through the failure of a reasoned search for counter-examples.) All the competent speaker need know is that that is a product which is $\sim -p_p$ and that that is impermanent which is $\sim -p_i$. And since p_p, the paradigm for 'product', will in general be a different image than p_i, the paradigm for 'impermanent', the mode of presentation of the particular denoted by 'this' in the two sentences will also differ from one sentence to the other.

It is important to point out that what I am calling sense in Dharmakīrti's semantics is not the mental image that serves as paradigm for a term. Dharmakīrti's is not an idea theory or a conceptualist theory of meaning. For the Buddhists the psychological machinery that explains our use of words is purely causal in nature and semantically invisible. Indeed there is here no *entity* whatever that is the sense of an expression. To say of a term that part of its meaning is its sense is to say that the term presents its referent in a particular way, that understanding a use of the term involves thinking of the referent in a manner that involves propositional structure. This is just what Dharmakīrti is claiming. To understand the statement of identity, 'This is a product', is to grasp the particular denoted by 'this' *twice*: once as just this unique particular that is different from every other particular; but also as a particular that is different from those particulars in the exclusion class formed by the paradigm for 'product'. The first grasping

is direct and nonpropositional; the second is a grasping of that particular by way of the sense of 'product'.[6]

Several points emerge from all this. First, it should be noticed just how austere a theory of sense this is. To understand the sense of 'product' is not to have a theory about those things that are products. (If one understands the term, then one will no doubt have various beliefs about products, but these beliefs are not part of the word's sense.) The senses that Dharmakīrti introduces will not support a doctrine of truth by virtue of meaning alone.

Nor are these at all like full-blown Fregean senses. Salmon[7] distinguishes among three components of Frege's notion of sense: the psychological – the purely conceptual representation which a speaker associates with a term; the semantic – that which fixes the reference at a possible world; and the cognitive – the information content that a word contributes to a sentence in which it occurs. Frege held that it is one thing that accomplishes all three tasks. Salmon makes the point that while a Kripkean direct reference theory is incompatible with this full-blown Fregean sense of sense, it is quite compatible with a leaner sense theory, in particular one that takes sense to be just the cognitive content of a term. Dharmakīrti's introduction of senses yields a kind of historical buttressing of Salmon's point. It is clear that a purely referential theory of meaning exerts a very strong pull on Dharmakīrti: The semantics of *apoha* is constructed in just such a way as to guarantee a referent for each meaningful term. He abandons a pure reference theory only in response to the informativeness puzzle, and the senses he introduces play no other role than that of cognitive content. The sense of 'product' is not the mental image a speaker associates with the term. Nor is it that which fixes the reference of the word – that job is done by the causal chain that extends back to the establishment of the convention governing the word's use. The sense of 'product' is just the information conveyed by its occurrence in a sentence – that its referent is different from the nonproducts.

The second point that emerges is more strictly historical in nature. In the Western tradition senses first emerged as part of a general strategy for handling predicative expressions without invoking real universals. It is only

relatively recently that the informativeness puzzle, and the allied phenomenon of referential opacity, have become important motivators of the sense-reference distinction. Dharmakīrti's discussion shows that it is not nominalism per se that leads to senses. By treating the predicate as a quasi-demonstrative, his theory yields a reference for such terms and thus appears compatible with a pure reference theory of meaning, until the informativeness puzzle arises. This is important because of the light it sheds on the controversy over the semantics of proper names. I suspect that much of this controversy stems from a tendency to associate the sense-reference distinction with the distinction between a particular and its properties. The semantics of Buddhist nominalism suggests that this association is mere historical accident.[8]

3.

The Prābhākara school of Mīmāṃsā might seem an odd place to look for clues concerning the sense-reference distinction. The Prābhākaras are both metaphysical and epistemological realists. Their metaphysical realism obviates the need for any complex function to serve as criterion of application of a general term: Since the universal cowness is perceptible, our ability to recognize a particular as the sort of thing that is called a cow is readily explained by our ability to perceive the cowness which inheres in that particular. Their commitment to epistemological realism means that the object of any cognition will have to be an extra-mental, extra-linguistic entity. Since the Prābhākaras think of sentences as serving, under specified circumstances, as means of knowledge, it is natural that they should think of our cognition of sentence meaning as the direct awareness of some extra-mental, extra-linguistic entity. Thus a strong form of semantic realism, in particular a strong form of the reference theory, is a natural outcome of their metaphysical and epistemological realism. Prābhākara would thus seem an implausible candidate for a discussion of the sense-reference distinction. This school is nonetheless forced to admit something sense-like into its

account of sentence comprehension. Our task shall be to see how this admission emerges out of its investigation of how we understand sentences.

In Indian philosophy of language there are three basic positions on the comprehension of sentences: the pure sentence theory, the designated relation theory, and the related designation theory. These positions can be seen as deriving from two basic principles which can guide our investigation of sentence meaning. The first is the context principle, according to which a word has meaning only in the context of a sentence. In its Indian manifestation this principle is generally supported by the observation that we never employ words in isolation, but only within sentences. The second principle is the composition principle, according to which the meaning of a sentence is a function of the meanings of its constituent words. This principle is generally supported by the observation that we understand a sentence only if we know the meanings of all its component words.

According to the sentence theory, the sentence is the basic, indivisible semantic unit. Word meaning is a mere theoretical construct of the science of grammar. Words stand to sentences, the sentence theorists claim, in the relation which we ordinarily believe to obtain between phonemes and words. While we would all agree that a word cannot be understood unless we cognize all of its constituent phonemes, we would not say that a phoneme is a semantic unit. By the same token, the sentence theorist argues, while we cannot understand a sentence unless we cognize all of its words, the fact that words are never used in isolation shows that the word is likewise not an independent semantic unit. This theory is obviously guided by the context principle to the exclusion of the composition principle.

The designated relation theory, by contrast, maintains that the word is the basic semantic unit. A word has as its meaning the entity which it designates.[9] Thus 'Devadatta' names the particular Devadatta, 'bring' names the action of bringing, and 'cow' names the universal cowness. Each of these words is capable of designating its meaning in isolation, and thus its semantic contribution to a sentence is invariant across sentences. To understand the meaning of a sentence we merely assemble the meanings of the constituent words to form a complex. Thus the sentence, 'Devadatta

brings the cow', designates or means the state of affairs, Devadatta bringing the cow. This theory is clearly motivated by the composition principle.

The related designation theory[10] is the Prābhākara view on sentence comprehension. This view has it that the meaning of a word as occurring in a sentence is some one entity in relation to the entities designated by the other words of that sentence. Thus the word 'bring' in the sentence, 'Bring the cow', designates the action of bringing in relation to the cow. This view is, I think, best seen as an attempt at constructing a theory of sentence comprehension which does justice to the context and composition principles alike. In accordance with the principle of composition, it is asserted that words do have meanings, and that the meaning of a sentence is determined by the meanings of its component words. But in consonance with the context principle, the theory claims that words do not have meaning in isolation but only when used in sentences. This can be seen from the fact that, for the Prābhākaras, the meaning of a word is its designatum or referent. Since a word can, on this view, complete its designative function only when the relata are brought to mind by the other words in a sentence, it follows that a word cannot be said to have meaning in isolation. These points should become clearer through an examination of some of the arguments for and against the related designation theory.[11]

The principal Prābhākara argument against the pure sentence theory is a variant on the 'infinite resources, finite capacity' strategy more recently used by Chomsky. Consider the eight sentences obtained by inserting the names 'Śiśa', 'Vatsa', 'Arbhaka', and 'Dimbha' into the sentence frames, '_____ bring the cow' and '_____ tie the cow'. Since these are eight distinct sentences, the sentence theorist must say that in order to understand them, one must master eight distinct designative powers. (A designative power is the capacity of an utterance-type to designate its referent.) If one allows that words have meanings, however, then since these sentences are composed out of seven words (the definite article is not employed in the Sanskrit equivalent), understanding the sentences requires mastery of only seven designative powers. Moreover, we can produce eight new sentences by inserting 'white' before 'cow' in each of the original eight. The sentence

theorist will then need 16 designative powers where a word theorist such as the Prābhākara needs only eight. Similarly, the sentence theorist is forced to deny the existence of any semantic relation between a sentence and its negation. In general it is argued that if we neglect the composition principle and thus deny that words play a semantic role in understanding sentences, the ability of the competent speaker to understand a very large class of sentences becomes virtually inexplicable.[12]

A chief Prābhākara objection to the designated relation theory is that this theory does not yield any natural explanation of a central feature of sentence meaning – that the meaning of a sentence is a unified relational complex. It is assumed, of course, that the meaning of a sentence is whatever a sentence designates; and Indian philosophers have generally taken the designatum of a sentence to be a state of affairs. Now a state of affairs is complex, consisting of two or more entities. But the entities which make up a state of affairs all stand in thoroughgoing interrelation. Thus if a sentence is to be said to designate a state of affairs, it must be capable of presenting the constituent entities not merely as a set of objects but as a unified relational complex.

The Prābhākaras use this claim – which we might call the relational unity thesis – against the designated relation theory in the following way. The latter theory involves the claim that a word has meaning in isolation – that it is capable of designating its referent apart from any sentential context. But this must mean that a word presents its meaning as an independent, unrelated entity. It would seem to follow, then, that on the designated relation theory the meaning of a sentence is just a collection of independent entities. The composition principle taken alone leads us into conflict with the relational unity thesis in that the composition principle seems to require that the meaning of a sentence be a function just of the meanings of its words. The result, as one author puts it, is that a sentence meaning becomes nothing more than a row of stakes. But surely there is all the difference in the world between a sentence and a list of names.

That the designated relation theorists perceived and sought to overcome this difficulty in their position is shown by the very name of their theory.

The theory is so called because it asserts that sentence meaning is obtained through the relation of those entities designated by the component words. Its proponents employed various means to try to show how a string of words with independent meanings could give rise to apprehension of a unified relational complex. The basic Prābhākara strategy in attacking these proposals is to try to show that nothing other than the words themselves can perform the function of presenting the relational component of sentence meaning. For instance, it is clear that the independent entities supposedly designated by the words cannot themselves cause us to apprehend their interrelations. If we perceive at three successive moments a patch of white, a neighing sound, and a certain odor, the color, sound and smell do not themselves cause us to apprehend their interrelatedness in a white, smelly horse. Nor could we say that words somehow endow their independent referents with the capacity to cause apprehension of relation. For instance, some designated relation theorists say that speaker's intention endows the designatum with the capacity to bring about cognition of relation. But this really amounts to saying that a speaker uses a word with the intention of designating some entity in relation to other entities. And that is tantamount to saying that the meaning of a word is just some one entity in relation to others. Again, other designated relation theorists claim that we go from independent entity to entity in relation by a kind of metaphorical transfer: A word directly designates an entity and secondarily or metaphorically implies that entity in relation to other entities. But, it is replied, the metaphorical use of a term is always exceptional: If we as a rule use a term to convey some meaning, that meaning must be its literal meaning, not its metaphorical meaning. And since we as a rule use words to designate entities in relation, the relational component must be part of the literal meaning of a word. The designatum of a word can only be some entity in relation to those entities designated by the other words in a sentence.

While the Prābhākaras make extensive use of the relational unity thesis as a way of motivating their related designation theory, they also display an underlying concern with the issue of what it means to say that one knows the meaning of a word. Thus against the designated relation theorist's claim

that word meanings may be learned ostensively, they propose the following account of language learning. The child, by observing competent speakers uttering and obeying various injunctions, learns that the meaning of an injunction is the action which is designated by that injunction. Thus it will learn that the meaning of, e.g., 'Devadatta, bring the cow', is the action of Devadatta bringing the cow. When the child has mastered a sufficient stock of sentences, it proceeds to the level of word meaning through the processes of inclusion and exclusion. Suppose we have mastered the meaning of these four sentences:

(1) Bring the cow.
(2) Bring the horse.
(3) Tie the cow.
(4) Tie the horse.

We notice that (1) differs from (2) just in the presence or absence of 'cow' from the sentence frame, 'Bring the _____'. Thus we hypothesize that the meaning of 'cow' will be that which is present in the satisfaction conditions of (1) and absent from the satisfaction conditions of (2). And similarly with (3) and (4). Our hypothesis is then confirmed when we notice how the presence of 'cow' in the distinct sentence frames, 'Bring the _____'. and 'Tie the _____' affects the satisfaction conditions of (1) and (3) respectively. That is, we discover the meaning of a word by noting how its exclusion from a given sentence frame and its inclusion in distinct sentence frames affect sentence meaning.

It might be thought that the process of inclusion and exclusion will lead us to the conclusion that 'cow' means cowness. This is wrong, according to the Prābhākara. Comparison of (1) and (2) justifies our saying that in (1) 'cow' designates cowness in relation to bringing. Comparison of (3) and (4) justifies our saying that in (3) 'cow' designates cowness in relation to tying. But comparison of (1) and (3) does not justify our saying that in general 'cow' designates cowness. The closest we can come to specifying what is common to the meanings of 'cow' in (1) and (3) is cownessR_____. But since

there is no such entity as a binary relation with only one relatum, we cannot say that the designatum of 'cow' is cownessR_____. We are thus forced to say that the meaning of 'cow' is cowness in relation to those entities designated by the other words in a sentence in which 'cow' occurs. And, it is worth noting that the same considerations apply to proper names as well.

While this is not expressly articulated, it seems that the underlying principle which the Prābhākaras have in mind here is that we do not know the meaning of a word unless we know how it is employed. We use words in the performance of a variety of linguistic actions, but these actions are in general performed only through the utterance of sentences. Thus we discover the meaning of a word only by investigating the semantic contribution it makes to the various sentences in which it occurs. While ostension might serve in some cases as an effective means of *preparing* for teaching the meaning of a word, it can never by itself bring about mastery of semantic role. We can learn to associate the phoneme-sequence 'Devadatta' with the person Devadatta through ostension. But the novice language learner will learn the use of 'Devadatta' – to bring about actions performed by Devadatta, to designate states of affairs in which Devadatta participates, etc. – only through exposure to various sentences in which the word occurs. We may, of course, use ostension to introduce new proper names into the lexicon of a competent speaker. But this is possible only because the competent speaker already understands the semantic role of a proper name (to designate a person in relation to entities designated by other words in a sentence in which the name occurs) and understands the convention governing ostension as a means of introducing proper names. The availability of such linguistic shortcuts merely obscures the fact that part of the meaning of a word is just the semantic role it plays in the various sentences in which it occurs.[13]

One stock objection to the related designation theory is the infinite correlates objection. A cow may be designated in relation to any one of a large number of entities: such actions as bringing, tying, and milking, such properties as white and fat, such substances as a barn and a field, etc. Moreover, a cow may be indirectly related, by way of those entities with

which it enters into direct relations, with yet more entities: with Devadatta through relation with bringing, with vision through relation with white, etc. In each such case the cow is capable of being designated as related, through relation with its direct relatum, with any of its indirect relata. Clearly, then, the cow is capable of being designated as participating in an indefinitely large, and possibly infinite, number of relational complexes. Now each such relational complex is a distinct entity. But the word 'cow' must be capable of designating a cow as participating in each of these complexes. Hence 'cow' must have an indefinitely large number of distinct meanings. In this case it is impossible to understand how we are able to comprehend novel sentences containing 'cow'.

The Prābhākara answers this objection in the following fashion. Suppose that we have mastered the use of 'cow' and 'goat' in such environments as, 'Bring the _____', 'Feed the _____', 'The _____is white', etc. We also know the meaning of 'Milk the cow,' but have not previously encountered the sentence, 'Milk the goat.' Now the context principle, when taken in conjunction with the realist scruples of the Prābhākaras, precludes us from saying that we know in advance the meaning of 'goat' in this sentence. For here 'goat' designates a goat in relation to milking, and by hypothesis we have not previously encountered a case of the word's being used to designate a goat in relation to milking. This does not mean that we shall fail to understand the sentence, however. Through our mastery of 'goat' in different sentences, we have come to associate the word with what is called its own-form or own-meaning, goatness. This own-meaning is apprehended in what is described as a type of nonpropositional cognition, which is akin to the immediate perceptual apprehension of goatness. This is not yet apprehension of meaning, however; for this, a further stage is required. We recollect that 'goat' has been previously used to designate a goat in relation to bringing, a goat in relation to white, a goat in relation to Devadatta, etc. Thus we know that 'goat' here will be used to designate a goat in relation to whatever is designated by the other words in the sentence. That is, memory informs us that 'goat' has always been used in the past to designate a goat in relation to some entity or complex of entities, namely whatever was

designated by the other words of the sentences in which it occurred. We are thus led to suppose that 'goat' is likewise here being used to present goatness together with its relation to whatever is presented by the rest of the words of the sentence. And we proceed in this fashion until we have obtained the meaning of the novel sentence as a whole.

It is here that we can discern at least implicit acceptance of the sense-reference distinction. The Prābhākaras never actually claim that word meaning has two distinct components; for them the meaning of a word is just that related entity a word denotes when used in a sentence. However, in distinguishing between the own-meaning of a word and the meaning of that word as used in a sentence, they are on the threshold of such a distinction. The point of the infinite correlates objection is that the semantic contribution of a word to sentences must have at least some common core that is invariant across different sentences. In accepting the composition principle, the Prābhākaras are committed to this claim. Now one possible candidate for the role of this common core is a Fregean unsaturated entity, but the Prābhākaras would reject such a solution for two reasons. First, their ontology does not allow for the existence of a binary relation with only one relatum, e.g., cownessR_____. Second, the relation which obtains between cowness and milking in 'Milk the cow', is a different relation than that which obtains between cowness and white in 'The cow is white.' Thus it appears that only the entity itself in its unrelated state can play this role. But merely to associate this entity with a word is not to understand the meaning of the word, for word meaning also includes a word's contribution to sentential unity, and this contribution will vary across sentences. The Prābhākaras put this point in terms of their distinction between the non-propositional cognition of a word's own-meaning and the recollection of the word's previous uses to designate that entity in relation to other entities. This is just the distinction between mere associative knowledge and propositional knowledge that is characteristic of the sense-reference distinction.

Of course it seems implausible to suppose that in order to understand the use of a word in a novel sentence one must literally recollect and run

through previously understood uses of that word in different sentences. If this is what the Prābhākaras are claiming, they are mistaken. A more charitable reading would have them saying only that to explain sentence comprehension we must ascribe to the competent speaker not just the ability to associate word with own-meaning but also the propositional knowledge that the word is used to designate that entity in relation to other entities. That is, this psychological model, which has the speaker recalling previous uses and thereby realizing that the word designates an entity in relation, is merely to be taken as a way of emphasizing the point that propositional knowledge must be invoked to explain speaker behavior. If this is what the Prābhākaras are saying, then they are surely right. While the ability to associate 'goat' with goatness can be explained in terms of purely neural machinery, the ability to understand 'goat' in a novel sentence, requiring as it does the ability to seek those other entities to which it is asserted to be in relation, cannot be explained without invoking propositional attitudes. The Prābhākaras say that upon hearing the first word in a sentence one grasps its own-meaning as 'related in general, unrelated in particular'. By this they mean that one grasps that the own-meaning is related to the entities designated by the other words of the sentence, *whatever those entities might be*. Here the occurrence of the variable in a tipoff: While the speaker might be said to be related de re to goatness, his relation to goatnessRx, with variable *x*, can only be propositional. Indeed the thrust of the infinite correlates objection was precisely that one cannot have knowledge *of* the infinitely many relational complexes into which goatness can be asserted to enter. The Prābhākara answer is just that one can nonetheless be said to know all of these complexes, namely by way of knowledge that the general sentence, 'The meaning of "goat" is goatnessR*x*' is true.[14]

Thus the Prābhākaras have, albeit unwittingly, introduced a new motivation for positing senses. It should be pointed out that these are very austere senses indeed, and far from full-blown Fregean senses; they do not, for instance, help solve the informativeness puzzle. Their theory does, however, give added weight to the claim that proper names have senses. And it also yields what I think is a better way of arguing for the sense-

reference distinction as applied to predicative expressions than that supplied by Frege.

Frege seems to have thought it would be odd if that which determines the truth-value of a sentence is not something in the world; and since predicative expressions help determine the truth-values of the sentences in which they occur, they, like singular terms, must denote something in the world. This is quite uncontroversial; the difficulty arises over Frege's further claim that such expressions denote incomplete or unsaturated entities, these being said to be the referents of predicates in just the way that the bearer of a proper name is said to be the name's referent. This is objected to on the grounds that unsaturated entities are ontologically queer, and that their posit is unnecessary given that the role of denotatum can be filled by the extension of a predicate. A deeper objection, though, would be that this involves unnecessary duplication of effort: The notion of incompleteness was originally brought in to help solve the problem of sentential unity, but that problem was solved by Frege at the level of sense. Is it really clear that the problem has an analogue at the level of reference? Dummett takes Frege to have been seeking, with his doctrine of unsaturated entities, a way around the problem of explaining the relation between universal and particular;[15] but it can be questioned whether solving this problem is a job for semantics.

The Prābhākaras would be among those who find unsaturated entities ontologically queer, but their potential contribution to the debate over the meanings of predicative expressions goes much deeper than this. Their theory requires that the meaning of any word have two components: the own-meaning, an object that can be grasped in nonpropositional cognition; and that which they consider to be the actual meaning of a word, the own-meaning in relation to other objects. Now the requirement that the own-meaning be the sort of thing that can be grasped in nonpropositional cognition means that it must be possible to apprehend it independently of any relations it might bear to other objects. This requirement is motivated by the fact that the infinite correlates objection cannot be answered in a way that is consonant with the composition principle unless there is some one entity that can be grasped, independently of relational ties with other

entities, as the core meaning of a word. Any number of entities could play this role in the case of predicative expressions: universals, properties, and perhaps even unsaturated entities if they are the sort of thing that can be grasped directly, without the mediation of a propositional attitude. Provided this basic requirement has been met, the related designation theory is, I think, itself neutral on the question of what type of entity the own-meaning or referent of a predicative expression is. What it does require is that a predicative expression have, in addition to its sense, the ability to pick out some one entity as its own-meaning. This is tantamount to distinguishing between the sense and the reference of a predicative expression.

8 It should be clear that the *apoha* theory also yields a solution to the informativeness puzzle when it is couched (as Frege couched it) in terms of proper names. Several centuries after Dharmakīrti his Tibetan Buddhist successors formulated the problem in just this way and used the approach I have described here to solve it. This is discussed in a paper by Tom Tillemans, 'Identity and Opacity of Reference in Tibetan Buddhist Logic', which was presented at the fifth annual conference of the International Association of Buddhist Studies, Oxford, August 1982.

9 In what follows, 'designates' and 'names' will be used as synonymous with 'refers'.

10 The terms 'related designation' and 'designated relation' are readily confused. The designated relation theory (*abhihitānvayavāda*) is the theory that those things which are designated by the words of a sentence are subsequently placed in relation. The related designation theory (*anvitābhidhānavāda*) is the theory that what is designated by a word in a sentence is already related. Thus the two names can be tied to the respective theories if 'designated relation' is thought of as the relation of what is already designated, and 'related designation' is thought of as the designation of what is already related.

11 These are examined in greater detail in my 'The *Prābhākara Mīmāṃsā* Theory of Related Designation', in B. K. Matilal and J. L. Shaw (eds.), *Analytical Philosophy in Comparative Perspective*, Reidel, 1985, pp. 253–297.

12 In 'Infinite Sets, Unbound Competences, and Models of Mind', *Perception and Cognition*, Minnesota Studies in the Philosophy of Science, vol. 9 (Minneapolis: University of Minnesota Press, 1978), pp. 183–200, Robert Schwartz attacks some recent formulations of the infinite resources, finite capacity argument. Richard Grandy formulates a version of the argument that appears immune to Schwartz' criticism in 'Semantics Intentions and Linguistic Structures', *Notre Dame Journal of Philosophical Logic* **23**, 329–30.

13 Compare Dummett's linking of the context principle and Frege's endorsement of contextual definition in *Frege: Philosophy of Language*, London: Duckworth, London (1981), p. 496.

14 There is, of course, a sense in which if one knows that every prime number greater than two is odd, then one knows of each prime number greater than two that it is odd. But this is not a sufficiently strong sense of knowledge de re to satisfy the opponent on his own terms. What he demands is that the speaker be causally related in a cognitively significant but nonconceptual way to each of the infinitely many relational complexes. This demand cannot be satisfied, hence the Prābhākara move to propositional cognition as a way of showing that the speaker does know all these complexes in a way, namely the knowledge-that way. The distinction I am appealing to here is that used by Aristotle to solve the *Meno* paradox of knowledge in *Posterior Analytics* I.1. It is also related to the *de relde dicto* distinction as drawn by Burge in 'Belief *De Re*', *Journal of Philosophy*, **LXXIV**, 338–62.]

Bhartṛhari's Paradox[*]

Hans G. Herzberger and Radhika Herzberger

I

Assuming that many things in our experience and in the world can be named, one may consider whether there are any limits to this process, and whether there are any things which cannot be named. This was a standing question in traditional Indian philosophy, with some schools of thought affirming that everything could be named while others denied it. The affirmative position was especially characteristic of the Nyāya-Vaiśeṣika school:[1]

> "Naiyāyikās are fond of a saying, which is sometimes found at the head of their works: whatever is, is knowable and nameable".

The negative position was characteristic of the Buddhist philosophers and may have been held by others as well. In its most general terms it may be formulated by an existential statement:

Unnameability Thesis: There are some things which are unnameable. While it may be surprising and to some extent counter to commonsense, this unnameability thesis belongs to the theory of language and should be subject to rational inquiry. But perplexities arise as soon as one tries to verify it by positive instances, for any positive instance of the unnameability thesis seems bound to name that which it declares to be unnameable. This is the problem we call "Bhartṛhari's paradox", after the fifth century

grammarian and philosopher of language, who clearly enunciated it in his *Vākyapadīya.*

Whether or not Bhartṛhari himself actually held the unnameability thesis is a difficult problem which we shall examine at some length. Some of his remarks at least suggest the unnameability thesis, without definitively committing him to it. Those who have studied the *Vākyapadīya* will perhaps appreciate how studiously noncommittal its author tends to be on matters of philosophical doctrine. In as much as the texts are inconclusive, the most we can do here is to formulate the exegetical problems with as much clarity as present understanding of Bhartṛhari's theory of language seems to permit.

To make the problem vivid to modern readers, we will then introduce some arguments of our own in favour of the unnameability thesis. To the extent that these arguments provide some support for that thesis, they strengthen the paradox. For it is in the nature of the problem that every argument advanced to support any instance of the unnameability thesis, drives one still more firmly into the paradox. This is one of the most perplexing features of our problem: the stronger those arguments, the more firmly they undercut their own conclusions; for they naturally tend to involve repeated reference to the very things whose unnameability they undertake to establish.

II

In this section we will examine some textual grounds for attributing the unnameability thesis to Bhartṛhari, and weigh these against conflicting interpretations. This examination will leave unresolved problems on both sides. But we hope the discussion will serve to focus the textual issues. In any case it will provide us with several interesting candidates for examples of things which cannot be named. Whether or not Bhartṛhari himself regarded these particular things to be strictly unnameable, he did single them out and seemed to be very well aware of their problematic status in connection with names and other denoting expressions.

Our text consists of the opening verses of the *Sambandhasamuddeśa* (*SS*) which is part of the third chapter of Bhartṛhari's *Vākyapadīya* (*VP*). *VP* is a treatise on Grammar, the science on which the interpretation of the Vedas depends. The topic of *SS* is the power of words to convey their meanings, and one of its themes is the doctrine that this power is no less 'eternal' and 'unchanging' than the Vedic injunctions themselves. In the course of discussing this theme, Bhartṛhari devotes some verses to the problem of using language to speak about its own fundamental powers.

The first verse of our text mentions several things and then comments on 'their relations':[2]

> From words which are uttered, the speakers's idea, an external object and the form of the word itself are understood. Their relation is fixed.
>
> (*SS* 1)

This highly comprehensive and so far nameless relation is Bhartṛhari's primary candidate for something unnameable. He explicitly says that it cannot be signified *in a certain way* (svdharmeṇa = on the basis of a property belonging to it). The main exegetical question is whether or not Bhartṛhari's semantic theory affords any *alternative* way of naming or signifying the relation in question. And, short of a full-scale reconstruction of that theory, as expounded throughout the nearly two thousand verses of the *Vākyapadīya,* it seems to be very difficult to settle that question in any definitive way. The problem is compounded by several difficulties of reconsiling Bhartṛhari's linguistic practice with his own linguistic theory. For he uses various linguistic devices to identify and denote the relation in question; and it is by no means clear how his own linguistic theory could accommodate some of those devices.

The relation in question connects 'words' with 'meanings', where each of these two terms covers a heterogenous variety of things. Under 'words' may be included morphemes, words and compounds of various grammatical categories: simple and compound nouns, verbs, particles, prefixes, and so forth.[3] Under 'meaning' may be included individual substances, processes,

powers, classes of these things, properties and ideas of any of the foregoing, and perhaps other things as well.[4] To cover this kind of range in English one needs to resort to one of the most general and flexible semantic terms like 'meaning' or 'signification'.

The third verse of our text tells us that the word-meaning relation is closely connected with the genitive case and with something (*vācya-vācaka*) which we render in English as 'significance':[5] The relation between words and meanings is understood by means of the genitive:

"This is the signifier (*vācaka*) of that;
that is the signified (*vācya*) of this."
Thus the thatness (*tattvam*) of the relation is signified.

(*SS* 3)

We cannot give a full account of this relation, and above all it should not be hastily identified with any modern counterpart from philosophical or commonsense semantics. We have chosen the word 'signifies' as a placeholder for a very comprehensive semantic relation whose content could be gradually unfolded by developing Bhartṛhari's full theory of language in its surrounding philosophical framework. The main thing for present purposes is to observe that the same Sanskrit term (*vācakam*) recurs in the next verse, modifying the term 'expression' (*abhidhānam*):[6]

Of the relation there is no signifying expression (*vācakam abhidhānam*) on the basis of a property belonging to it.

(*SS* 4a)

Now we want to examine the logical bearing of this verse on the proposition:

B1   The significance relation is unnameable

which is an instance of the unnameability thesis. There are several differences of wording between *B1* and the textual passage *SS 4a,* and the exegetical problem is whether or not the passage, taken in the larger context

of Bhartṛhari's semantic theory, implies *B1*. We will comment on each of three points of difference.

In the first place, *B1* explicitly identifies "the relation" mentioned in *SS 4a* as the signifier-signified relation, under discussion in these verses of *SS*. The text is quite clear on this point and we do not regard it as controversial.

In the second place, B1 has 'name' where SS 4a has 'signifying expression'. Given the very comprehensive character of the signifying relation, it is natural to regard names as a special kind of signifying expression. For our purposes, the most prominent distinguishing feature of names is their grammatical status as singular nouns or singular nounphrases. On this usage one would not regard prepositions, suffixes or verbs as names of what they signify. We shall provisionally regard singular pronouns and demonstratives as names, on the understanding that this treatment is eminently open to revision.

In the third place, *B1* omits the qualifying phrase 'on the basis of a property belonging to it'. The justifying argument for this omission would be that the phrase in question is not understood in context as a restrictive qualification, for in Bhartṛhari's semantics all naming is 'on the basis of a property'. Thus *VP* III.14.274 states that words have no application without 'occasioning grounds'; and other passages suggest that even proper names and perhaps demonstratives as well denote through some fixed or contextually determined individuating property.[7]

The last of these points is one of the most important in evaluating the claim that *SS 4a* in its textual context implies *B1*. If Bhartṛhari's semantics could accommodate names with some mode of significance other than that 'on the basis of a property', then *SS 4a* would not commit Bhartṛhari to the unnameability thesis. But we have not been able to find any direct evidence that he did admit names with any alternative mode of significance. Could there be some indirect evidence?

One might look for indirect evidence in Bhartṛhari's own linguistic practice. He uses various Sanskrit expressions to introduce the significance relation and identify it to his readers. The first verse of our text introduces it as *teṣām saṃbandhaḥ* (their relation), the third verse calls it *yogah*

śabdārthavoḥ (the relation of word and meaning), and so on. These are nominal expressions and so may be classified as names in our broad sense, which are *prima facie* counterexamples to *Bl.* And so, the argument would run, had Bhartṛhari been committed to *B1* in full strength, and not merely to the weaker proposition *SS 4a* he would have been committed to a principle which is inconsistent with his own linguistic practice. Therefore, the argument continues, one should regard the phrase 'on the basis of a property (etc.)' as a restrictive clause, and construe the various names Bhartṛhari uses for the significance relation, as names which signify on some other basis.

This indirect argument against attributing *B1* to Bhartṛhari, cannot be dismissed lightly. But a fuller reflection will show that it cannot be taken to be decisive either. In the first place at least one other verse of our text apparently implies an unqualified instance of the unnameability thesis, in connection with the inherence relation:[8]

> The relation called inherence, which extends beyond the signifying function (vācyadharmātivartinī) cannot be understood through words either by the speaker or by the person to whom the speech is addressed.

(*SS* 19)

Helārāja's commentary on this verse ends with the statement: "Therefore it (inherence) is truly unsignifiable (avācya)".[9] This provides some evidence that Bhartṛhari was committed to:

B2.   The inherence relation is unnameable

Since the text supporting *B2* makes no reference to properties as the basis of naming, the indirect argument advanced against *B1* would not apply here in the same form.

We are well aware that some new indirect argument might be advanced against *B2*, once more on the basis of a conflict between principles and practice. For Bhartṛhari does use the word *samavāya* throughout to name that which *B2* declares to be unnameable. And so, the new indirect argument might run, had Bhartṛhari been committed to *B2* in full strength,

and not merely to some weaker proposition, he would have been committed to a principle which was inconsistent with his own linguistic practice.

We are now in a position to recognize the ground of these indirect arguments in the very phenomenon of Bhartṛhari's paradox. According to that paradox, any statement of any instance of the unnameability thesis is bound to use some name or expression to identify that which it declares to be unnameable. So any statement of any such principle seems bound to conflict with linguistic practice at some point. The very inevitability of such a conflict to some extent weakens these indirect arguments and justifies a demand for textual evidence of a more direct kind. One cannot rule out the possibility that Bhartṛhari really did hold some instance of the unnameability thesis and thereby really was committed to a linguistic theory which he himself couldn't reconcile with his own linguistic practice. That would after all be poetic justice for the author of our paradox.

Some remarks of Helārāja suggest yet another reading of Bhartṛhari's position on the unnameability thesis. The commentary to the fourth verse of *SS* in effect treats the genitive locution as if it were an *exception* to the rule:[10]

> ... There, apart from the genitive locutions, there is no signifying, that is, elucidating, expression for it ...

and Subramania Iyer's translation of Bhartṛhari's verse incorporates this reading:[11]

> There is no verbal element (besides the genitive suffix) which denotes this relation in its essential property.

by interpolating the parenthetic phrase although it does not appear explicitly in the Sanskrit text. Helārāja's reading would provide one more way of detaching the verse SS 4a from the special unnameability thesis *Bl.*

It is our view, however, that a closer examination of the genitive locutions in question will make it clear why they are not exceptions to *Bl.* There is a matched pair of these genitive locutions. One describes a certain demonstrated word (this) as a *vācaka*, and the other describes a certain demonstrated meaning (that) as a *vācya:*

i. This is the signifier of that
ii. That is the signfied of this

Each has the grammatical structure: demonstrative + copula + singular nounphrase, or in our provisionally simplified terminology: name + copula + name.[12] Four names are involved:

a. this (word)   *c.* the signifier of that

b. that (meaning) *d.* the signified of that

and inspection will show that none of them names the significance (*vācyavācaka*) relation. Two of them (*a* and *c*) name a certain *word*, and the other two (*b* and *d*) name a certain *meaning*, or thing signified. So the constituent names of (i) and (ii) name arguments ("relata") of the relation in question. Two of them (*c* and *d*) are names of that special sort which in traditional grammar were called 'relative terms': they denote some thing by reference to the relation it bears to something else. The relation figures in the process of understanding those relative terms, but not as denoted or named by those terms.

This analysis may help us to sharpen the contrast between what *SS3* says that the genitive locution *can* signify, and what *SS4* says that locutions in general *cannot* signify. What the genitive locution signifies, according to the last clause of *SS3*, is something connected with the significance relation (its 'thatness'), not the relation itself. In lieu of a full account of what Bhartṛhari meant by 'thatness' (*tattvam*), we offer the following interpretation of the way it applies to the case at hand: the 'thatness' of a relation resides in its concrete manifestations, the particular individuals which stand in that relation to one another — in short, its arguments.

To justify this interpretation one need look no further than the genitive locutions offered by Bhartṛhari to signify 'the *tattvam* of the relation'. These locutions in fact name a particular argument, or pair of arguments, of the significance relation: a particular word (*vācaka*) and its meaning (*vācya*). From the standpoint of grammatical analysis this is very different from naming a relation in which those particular individuals stand, even when

the names employed for those individuals are relative terms. From the standpoint of logical analysis, a relation is ontologically distinct from any pair of its arguments, and naming the one is a different matter from naming the other. A given word can stand in various relations to different things: it can be a *vācaka* of one thing, a synonym of another and an antonym of a third. And yet significance, synonymy and antonymy are obviously three distinct relations. In the present context there is another logical difference of considerable importance. In Section IV we will examine some logical reasons why the naming relation cannot be named; but these reason clearly do not carry over to the particular names which are among the arguments of that relation. Nor do they carry over to the particular individuals which bear those names and are the remaining arguments of that relation. They can of course be named, by using their individual names. Logical problems arise only in connection with naming the naming relation itself; and this highlights a rather striking contrast between the logical status of a relation and that of its arguments.

From both a grammatical and a logical standpoint then, we can see how Bhartṛhari might state in one verse that the genitive locution signifies the thatness of the significance relation, and in the very next verse deny that any expression can signify that relation. So we find no reason to regard the genitive locutions as exceptions to the unnameability thesis, and we conclude our examination of the claim that Bhartṛhari held that thesis and asserted *B1* as an instance of it.

III

Enough has been said to indicate the complexity of the exegetical problems surrounding the question of the strength of Bhartṛhari's commitment to the unnameability thesis. His statement of the paradox is perhaps somewhat less problematic, at least to the extent that he presents it unmistakably and without qualifications. Several consecutive passages in our text clearly testify to Bhartṛhari's awareness of the paradoxical character of instances of

the unnameability thesis. Following his statement that inherence 'cannot be understood through words', Bhartṛhari writes:[13]

> That which is signified as unsignifiable, if determined to have been signified through that unsignifiability, would then be signifiable.
>
> (*SS* 20)

> If (the word) 'unsignifiable' is being understood as not signifying anything, then its intended state has not been achieved.
>
> (*SS* 21)

> Of something which is being declared unsignifiable that condition (of being signifiable) cannot really be denied by those words, in that place, in that way, nor in another way, nor in any way.
>
> (*SS* 22)

These verses address themselves to some statement like:

> B3. *The inherence relation is unsignifiable*

and treat of the mode of significance of the predicate of that sentence ('*avācyam*' = 'unsignifiable'). We take them as offering an explanation of the paradoxical character of statements like *B3*.

To obtain a somewhat sharper view of the paradox, attention must also be paid to the subject terms of such statements; *B3* is self-refuting on account of an opposition between its subject and predicate terms. In order for *B3* to be true, its subject term must signify something, and its predicate term must be true of that thing; so its subject term must signify some unsignifiable thing. Because that condition cannot be satisfied, *B3* cannot be true. By a parallel line of reasoning, neither *B1* nor *B2* could be true, and perhaps more generally one might conclude that no instance of the unnameability thesis could be true.

In our view the very fact that Bhartṛhari devoted several verses to such a careful formulation of the paradox, covering all cases ("not … in that way, nor in another way, nor in any way"), shows that the unnameability thesis or some variant of its was at least under serious consideration at that point

in his discussion. But Helārāja's commentary to these verses brings out an exegetical problem on a different plane from those we have so far considered. We will call this the problem of *attribution.*

The exegetical problems discussed in Section II concerned matters of explication of the content, understood in context, of several propositions in the text. But one need not assume that Bhartṛhari intended to *assert* every proposition contained in those verses. Some he may have been simply entertaining in the course of developing his position or arguing for it. Among these latter may be propositions he was voicing on behalf of others, as *objections* or *criticisms* to be answered; and so forth.

This general problem of attribution which is familiar to Bhartṛhari scholars, interacts with the semantic problems of elucidation in a very tangible way, inasmuch as one's interpretation of a particular passage "in context" depends on one's understanding of Bhartṛhari's overall theory of language, which in turn is woven out of various propositions one attributes to Bhartṛhari from the passages in his text. We have illustrated this interaction in the previous section in the course of examining Bhartṛhari's commitment to the unnameability thesis. By and large, however, the emphasis there was on matters of elucidation. In this section, matters of attribution come into prominence. The content of the Verses 20 to 22 seems to us relatively unproblematic in comparison with various matters concerning their role in the discourse. Whether Bhartṛhari should be taken as having asserted those propositions or merely as having voiced them on behalf of others, is a problem too complex to be resolved here.

It was Helārāja's view that the propositions expressed in Verses 20 to 22 of *SS,* making up what we have called Bhartṛhari's paradox, were not asserted by Bhartṛhari but were merely voiced on behalf of certain actual or potential critics. In his commentary to Verse 23, Helārāja describes the preceding three verses as "Naiyāyikā casuistry" (*vākchala*), and he describes the subsequent verses as "an answer" to them.[14] Our own view is that those verses cannot be dismissed as 'casuistry', however the problem of attribution is ultimately decided. There seems to us to be a genuine paradox here, which offers no easy way out. This will be argued in the next two sections.

IV

We have put before ourselves two instances of the unnameability thesis, concerning two fundamental semantic relations: significance (*B1*) and inherence (*B2*). One passage of the text states that thest two relations are distinct ("inherence … extends beyond the signifying function" (*SS 19*)) and another passage states that they are closely interconnected (*SS 13*). Without trying to work out the exact connections between them, we have examined with some care the textual basis for each of these two instances of the unnameability thesis. Now we propose to move the discussion to a more analytical level on which we will begin to open for ourselves the question of the unnameability thesis and its grounds in the structure of language. In this section we will follow what we take to be Bhartṛhari's insights, but deal with them using analytical resources beyond those that were available to Bhartṛhari.

Examining the unnameability thesis as a contemporary issue in the philosophy of language, we believe that thesis can be supported by some arguments of rather considerable strength and generality. We will present these arguments informally at first, making use of commonsense notions. Then they will be related to modern ideas from the theory of sets, with the aim of making the arguments more rigorous. No historical claims should be read into the discussion of this section. Its purpose is to examine Bhartṛhari's paradox as a living problem, and in the process to make an effort to crystallize from it the sharpest possible formulation.

The proposition that the significance relation is unnameable can most easily and directly be derived from a still more general proposition:

R1.   The significance relation is unsignifiable

What this means in the context of the present paper is that there is no expression, of any grammatical category, which bears the significance relation to the significance relation. Equivalently: the *vācya-vācaka* relation has no *vācaka*, and is not itself a *vācya*. Once unsignifiability of the relation has been established, its unnameability will follow as a special case.

We will now sketch a *proof* for *R1* from the still more general proposition that no relation can be one of its own relata. If this holds for all relations, it holds for the significance relation as a special case (*R1*); and from that special case, *B1* would follow as a still more special case.

To build up some intuition concerning the problem, consider the naming relation, which obtains between names and their bearers: between the name 'Krishna' and the playful blue god, between the name 'Gauriśankar' and the highest mountain on earth, and so forth. It takes its place as one relation among others: the parent-child relation among humans, the dominance relation within a herd of elephants, the natural ordering relation of the positive integers. In general there is no semantic problem about naming various relations: we fix the relation in our mind and then discover or invent some name for it. However a specific problem does arise in the case of the naming relation itself. The first step presents no difficulty; we can fix the relation as an object of thought. Nor is there any obstacle to selecting a name; on the contrary, various languages incorporate several syntactic devices capable of forming names of relations. In the first place one can specify the characteristic domain and counterdomain of the relation, as in forming the name 'the parent-child relation'. Secondly one can nominalize one of the verb-forms which express the relation, as in forming the name 'the dominance relation' from the transitive verb 'dominates'. Thirdly one can find a uniquely descriptive phrase, as in forming the name 'the natural ordering relation among the positive integers' for the relation ≥.

Having fixed the relation as an object of thought, and having selected one or another suitable expression to name it, the only thing left would be tying the two together within the naming relation. And the last step is the hardest, for in the special case at hand, one is called upon to make a relation one of its own relata; and this almost invariably binds one in a conceptual knot. The parent-child relation is neither a parent nor a child; no elephant dominates the dominance relation; no number is greater than or less than the natural ordering relation among the positive integers. Nor does this seem to be an historical accident of classification or usage. How could it be otherwise? How could *any* relation be one of its own relata?

To sharpen this question a bit, let us consider a parallel question that has received much attention in the theory of sets: could any set be a member of itself? As Bertrand Russell observed at the beginning of the century, sets are not ordinarily members of themselves; but there might be thought to be some extraordinary sets which are members of themselves.[15] Let us consider this possibility. The set of all mangoes is certainly not itself a mango; but then, the set of all things which are not mangoes isn't a mango either, and so it does or 'should' belong to itself. This line of thought leads directly into what is known as Russell's antimony concerning the set of all sets which are not members of themselves. In order to resolve this and allied antinomies, standard axiomatic set-theories deny the existence of any sets which are members of themselves. In accordance with those theories, there is no set of all things which are not mangoes; for it there were, *per impossibile* it would have to be a member of itself.

The problem of sets being members of themselves is only part of a larger problem, and the set theories in question have been framed in such a way as to preclude the existence of any set which is a member of itself once removed (i.e. a member of a member of itself), or a member of itself twice removed, etc. In general, the set-membership relation is required to be 'acyclic', by a principle called the *axiom of regularity.*[16]

This doctrine has consequences for our problem as soon as we take into account that every relation has some set of its 'extension': some set of ordered pairs. Let N be the set of all ordered pairs $\langle n, b \rangle$ consisting of a name, n, and the bearer of that name, b. For example, the pair $\langle$ the name 'Krishna' the playful blue god $\rangle$ belongs to N, as does the pair $\langle$ the name 'Gauriśankar', the largest mountain on earth $\rangle$, and so forth. The set N is the 'extension' of the proper-name relation. Now the question of whether or not the naming relaion can be named, is connected with the question of whether or not the set N could contain some pair $\langle n, N \rangle$. Such an eventuality would not require N to be strictly a member of itself, but more precisely would require N to be "part of" a member of itself. According to the usual set-theoretical construal of relations, the ordered pair $\langle n, N \rangle$ would itself be treated as a set of sets.[17] Consequently, the naming relation could be named

only if *N* could be a member twice removed of itself, and this is incompatible with the regularity axiom.[18]

By this reasoning a general theorem about relations can be derived from the standard principles of the mathematical theory of sets:

Regularity Theorem: No relation can be one of its own relata

The label attached to this theorem underscores its reference to some "regular" theory of sets, that is some theory incorporating the axiom of regularity or an equivalent principle.[19]

Without committing ourselves to any special assumptions regarding the nature of language or the naming process, but only to some more fundamental assumptions concerning the nature of sets, a substantial case can now be built up to support the unnameability thesis. In the first place, *R1* is an immediate corollary to the regularity theorem, quite independently of any questions about the exact interpretation or English translation of '*vācya-vācaka*', so long as it is treated as a relation having some regular set for its extension. In the second place, *B1* is a consequence of *R1* assuming only that whatever can be named can be signified.

V

Having approached the unnameability thesis now from more general considerations, it is possible to reinforce our paradox by establishing a whole family of variations on *B1*. As an introduction to those variations, let us reflect briefly on one natural response to the paradox. Up to this point we have used the term "name" in an unusually extended sense, to include proper names, definite descriptions, and even demonstratives. In accordance with this broad usage, one could hardly deny that *B1* contains a name (the phrase 'the significance relation') for that very thing which *B1* declares to be unnameable. Now someone might suggest that what drives one into the paradox is just this policy of using the term "name" in an extended sense.

Consider the alternative policy of restricting the term 'name' to proper nouns like 'Krishna' or 'Gauriśankar'. One way of implementing this policy might be to use the term "denote" for the more extended concept, so that definite descriptions and demonstratives would be said to denote but not to name that which they signify. Now, taking a closer look at *B1*, we see that under the new policy it would no longer name that which it declares to be unnameable; rather, it would quite legitimately denote that which it declares to be unnameable, and the paradox would be resolved. This line of reasoning may seem to turn Bhartṛhari's paradox as so far discussed into 'casuistry' or some sort of verbal trap constructed out of the extended usage of 'name'. And indeed, common usage may well favour some more restricted usage and thereby offer what seems to be a natural resolution of the problem.

We shall now suggest that no such resolution can be satisfactory, for its apparent success must depend on a very limited view of the whole matter. Any sharply drawn boundary between names and denoting phrases, transfers the paradox from *B1* to:

R2. The significance relation is undenotable,

which on the one hand could be derived from the regularity theorem, and on the other hand would — according to the new policy — denote that which it declares to be undenotable. Nor will the drawing of any number of additional boundaries within the field of what we originally called 'names', ever be able to fully resolve the problem.

Furthermore, in the presence of certain minimal assumptions regarding the connections between naming, denoting and signifying, additional consequences can be derived. The regularity theorem can be generalized in several ways. One simple generalization is:

Indirect Regularity Theorem: No relation can be one of the relata for any one of its own subrelations.

The sense here is that if *Q* is included in *R* as a subrelation, then *R* cannot be a relatum for *Q*. Therefore, under the assumption that naming is a case of denoting which in turn is a case of signifying:

R3. *The significance relation is unnameable.*

R4. *The denoting relation is unnameable.*

In the presence of an additional assumption connecting significance with inherence, *B2* and *B3* can also be derived from the indirect regularity theorem.

The assumption is that signifying is a subrelation of inhering. This assumption is suggested by verse 13 of our text:[20]

> On the basis of the relation of inherence (a word's) own substratum and own universal are understood. On the basis of inherence in a single substratum, on the other hand, the quality which belongs in its own substratum alone is understood.
>
> *(SS 13)*

and is consonant with other passages such as "inherence … extends beyond the signifying function". *(SS 19).* Conditional upon this assumption and the previous one that naming and denoting are subrelations of signifying, we could derive:

R5. *The inherence relation is unnameable.*

R6. *The inherence relation is undenotable.*

R7. *The inherence relation is unsignifiable.*

These seven special unnameability, undenotability, and unsignifiability results, are just a few examples to illustrate the stability of Bhartṛhari's paradox when it is understood more broadly as a theme with many variations.

NOTES

1 See K. Potter, 1977, p. 48. Further discussion is to be found in K. Potter, 1968, which also describes a contradiction having some affinity with Bhartṛhari's paradox, but arising within a rather different philosophical context.

2

jñānaṃ prayoktur bāhyo'rthaḥ svarūpam ca pratīyate /

śabdair uccāritais teṣām saṃbandhaḥ samavasthitaḥ //

Except for the word jñānam which is translated as idea in order to accommodate the complexity read into it by Helārāja, the translation is Subramania Iyer's: Iyer, 1971, p. 76. Unless specifically stated the translations are ours.

3 See, for instance Helārāja's introductory remarks to VP. III. 1.1.

4 See Helārāja's remarks on VP. III. 1.2.

5

asyāyam vācako vācya iti ṣaṣṭhyā pratīyate /

yogaḥ śabdārthayos tattvam ity ato vyapadiśyate //

6

nābhidhānam svadharmeṇa saṃbandhasyāsti vācakam /

7 In the *jātisamuddeśa* the property on the basis of which names are given to objects is identified with universals (*jāti*): VP. III.1. 6–8; in the *dravyasamuddeśa* with a limiting feature (*upādhi*): Helārāja on VP. III.2.2, p. 108. 1–9; in the *guṇasamuddeśa* with a quality (*guṇa*): Helārāja on VP. III.5.1, p. 192–203. The lack of a uniform vocabulary is not surprising in the context of Bhartṛhari's commitment to a metaphysically neutral semantic theory. (*sarvapārṣadasāmānyam śāstram*). There is evidence in support of our view that for Bhartṛhari proper names do not name their subjects directly. For instance Helārāja on VP. III. 1.2, p. 9.6–7 says: "It will be established that even (proper) names like Ḍittha express universals

(*saṃjñāśabdānām api Ḍitthādiśabdānāṃ jātivācitvaṃ samarthayiṣyate*)",

a remark which is elaborated on by him in Vp. III.5.1, p. 193. 17–20; see also VP. II. 366 and the discussion of the proper name Kharaṇasa (long-nosed) in VP. II. 364–365. Our evidence for the demonstrative is indirect and is drawn from Bhartṛhari's analysis of negative sentences. The sentence 'This is not a Brahmin' is meaningful if the reference is to someone who bears a resemblance to a Brahmin, to someone who for instance has tawny hair (*pingalakeśin):* see VP. III.14.263, 281, 301. This would seem to suggest that the demonstrative refers to its object through a property which is determined by the adjoining predicate expression. The property would therefore not be fixed (*dhruvam*) but would be context dependent. The demonstrative would signify its object in the same way in which a crow signifies the house on which it sits: VP. III. 2.2.

8

prāptiṃ tu samavāyākhyām vācyadharmātivartinīm /

prayoktā pratipattā vā na śabdair anugacchati//

9 *iti avācya eva bhāvato'yam*: Helārāja: on VP. III.3.19. p. 137. 1–2.

10 *tatra ... vācakaṃ pratyāyakam, abhidhānam ṣaṣṭhivyatiriktaṃ nāsti*: Helārāja on VP. III.3.4. p. 128–10–11.

11 Iyer, 1971. p. 80.

12 Since Sanskrit does not have a copula the sanskrit counterparts for *a–d* have the grammatical structure: demonstrative + implicit verb + noun phase. The four names involved would be:

a. *ayam*
b. *ayam*
c. *asya vācakaḥ*
d. *asya vācyaḥ*

13

avācyam iti yad vācyaṃ tad avācyatayā yadā /

vācyam iti avasīyeta vācyam eva tadā bhavet //

tathānyathā sarvathā ca yasyāvācyatvam ucyate /

tatrāpi naiva sāvasthā taiḥ śabdaiḥ pratiṣidhyate//

14 Helārāja on VP. III.3.3, p. 138. 12–13.

15 See B. Russell, 1908.

16 See P. Suppes, 1960.

17 The order pair ⟨*n*, *N*⟩ would be defined as the set {{*n*}, {*n*, *N*}}whose members are the set {*n*} whose only member is *n*, and the set {*n*, *N*} whose members are *n* and *N*; so it would follow that *N* would be a member of a member of ⟨*n*, *N*⟩. See Suppes 1960 (Chapter 2 Definition 10, and also Chapter 3).

18 What is in question is the proposition that *N* might be a member of some'set {*n*, *N*} which is a member of ⟨*n*, *N*⟩ which is a member of *N*.

19 It should be remarked that there do exist some rather special axiomatic set theories in which the axiom of regularity does not hold; one well-known example is W. V. Quine's system *NF* ("New Foundations"), described in Quine 1963. These systems show the possibility of operating consistently with nonregular sets; but it is not easy to see how they could provide any intuitively satisfactory resolution for Bhartṛhari's paradox.

20

Series Preface

No anthologist succeeds in including everyone's favorites, so a few words about the principles of selection seem appropriate. Firstly, as with other volumes in this Garland series, priority has been given to journal articles, rather than book chapters. However, some essential book chapters have been included, and the introductions to each volume include references to significant books. Readers in search of further bibliographical assistance should consult what is now the standard source: Karl H. Potter, *Bibliography of Indian Philosophies*, 3rd rev. ed. (Delhi: Motilal Banarsidass, 1995), and the on-line updates to it available at the "Indian Philosophy Bibliography" (http://faculty.washington.edu/kpotter/). Secondly, the emphasis throughout is on *philosophical* studies of Indian philosophy. Consequently, much excellent historical and philological work has been omitted. Thirdly, the desire to make Indian philosophy accessible to interested Western philosophers has meant not only that all the selections are in English, but also that most of them use a minimal amount of unglossed Sanskrit terminology. This restriction has prevented the inclusion of more work by Indian authors.

Finally, I would like to acknowledge gratefully all the good advice and generous assistance I have received from Chakravarthi Ram-Prasad, Mark Siderits, and (most especially) Stephen Phillips. The blame for any shortcomings that may remain rests, of course, solely upon my own shoulders.

Series Introduction

The five volumes of this series collect together some of the most significant modern contributions to the study of Indian philosophy. Indian philosophy is one of the great philosophical traditions of the world. Unfortunately, however, its philosophical riches are not always as readily accessible to Western philosophers as might be desired. The selections in these volumes help to redress this situation by giving readers easy access to some of the best philosophical work in the area, including material that is often difficult to locate.

Collectively the selections in these volumes explore many of the important commonalities and differences between the Indian and Western philosophical traditions. These similarities and differences are philosophically pregnant. There is enough in common between Indian and Western philosophy to suggest that the philosophers in both traditions are often engaged with similar problems and hence should be able to communicate with each other. However, there are also sufficient differences between the traditions to suggest that they may have some novel perspectives to offer each other.

In choosing the selections for this series priority has been given to journal articles, rather than book chapters. However, some essential book chapters have been included, and the introductions to each volume include references to significant books. The emphasis throughout is on philosophical studies of Indian philosophy. The desire to make Indian philosophy accessible to interested Western philosophers has meant not only that all the selections are in English,

but also that most of them use a minimal amount of unglossed Sanskrit terminology.

Volume 1: Epistemology is concerned with the nature and scope of Indian pramāṇa theory, i.e. that part of Indian philosophy concerned with the nature and sources of knowledge. Indian philosophers developed a causal theory of knowledge and acknowledged the existence of a number of valid ways of knowing, including perception, inference and testimony. The Indian pramāṇa theorists thus discussed many issues that have also occupied Western epistemologists, often offering importantly different perspectives on these matters. They also sometimes addressed various interesting questions about knowledge that are unfamiliar to Western epistemologists.

The selections in this volume discuss Indian treatments of epistemological topics like the means of knowledge, realism and anti-realism, truth, knowledge of knowledge, illusion and perceptual error, knowability, testimony, scepticism and doubt.

Volume 2: Logic and Philosophy of Language is concerned with those parts of Indian pramāṇa theory that Western philosophers would count as logic and philosophy of language. Indian philosophers and linguists were much concerned with philosophical issues to do with language, especially with theories of meaning, while the Indian logicians developed both a formalised canonical inference schema and a theory of fallacies. The logic of the standard Indian inferential model is deductive, but the premises are arrived at inductively. The later Navya-Nyāya logicians went on to develop too a powerful technical language, an intentional logic of cognitions, which became the language of all serious discourse in India.

The selections in this volume discuss Indian treatments of topics in logic and the philosophy of language like the nature of

inference, negation, necessity, counterfactual reasoning, many-valued logics, theory of meaning, reference and existence, compositionality and contextualism, the sense-reference distinction, and the nature of the signification relation.

Volume 3: Metaphysics is concerned with the complement to pramāṇa theory, i.e. prameya theory. Whereas the pramāṇnas are the means of knowledge, the prameyas are the knowables, cognisable entities that constitute the world. With respect to the number and kinds of such entities, there was a very wide variety of opinion among classical Indian philosophers — including variants of monism, dualism and pluralism about both entities and kinds. Many metaphysical topics were debated, but two of the most important were causation and the nature of the self. The competing theories offered about these two issues also raised other questions about the metaphysics of wholes and parts, substances and properties, and universals and particulars.

The selections in this volume discuss Indian treatments of topics in metaphysics like ontology, constructionalism, universals, negative facts, mereology, causation, relations, freedom and determinism, and theories of the self.

Volume 4: Philosophy of Religion is concerned with something that can be described as "Indian philosophy of religion," i.e. "philosophy of Indian religions." Contrary to popular Western belief, classical Indian philosophy was not indistinguishable from Indian religion — as even a cursory glance at the first three volumes of this series will demonstrate. Religious concerns, though, did motivate the work of many Indian philosophers. However, important differences between the major Western religions and the major Indian religions (Hinduism, Buddhism, Jainism) mean that the shape

of Indian philosophy of religion is often significantly different from that of Western philosophy of religion.

The selections in this volume discuss Indian treatments of topics in the philosophy of religion like the problem of evil, God, theological monism and dualism, atheism, the concept of a perfect being, reason and revelation, rebirth and karma, religious language, religion and politics, ritual and mantra, and the religious determinants of metaphysics.

Volume 5: Theory of Value is concerned with Indian discussions in the areas of ethics, politics and aesthetics. The Indian philosophers had a good deal to say about the theory of value as they vigorously discussed topics like the ends of life and the relation of virtuous action to those ends. A traditional Hindu classification recognises four classes of values: dharma (morality, virtue), artha (wealth, power), kāma (pleasure), and mokṣa (liberation). Mokṣa is usually held to be the highest value and is extensively discussed in the paradigm Indian philosophical texts. Indian political and legal theory is concerned with the values of artha and dharma. Aesthetic pleasure is one of the subject matters of a developed body of writing on aesthetic theory. Rasa ("flavor"), the special feeling or enjoyment that pervades an artwork or is aroused in its contemplator, is commonly seen as detached from the aims and concerns of ordinary life, with some even suggesting that it provides a foretaste of the bliss of mokṣa.

The selections in this volume discuss Indian treatments of topics in the theory of value like the proper ends of life, the relation of dharma and mokṣa, liberation and pleasure, the sources of our knowledge of right and wrong, the ethics of non-violence, the status of the supra-moral, egoism and altruism, the theory of rasa, aesthetic experience and catharsis.

Volume Introduction

The complement to *pramāṇa* theory is *prameya* theory. Whereas the *pramāṇas* are the means of knowledge, the *prameyas* are the knowables, cognizable entities which constitute the world. With respect to the number and kinds of such entities, there was a very wide variety of opinion among classical Indian philosophers. Moreover, since according to most Indian systems knowledge of reality is at least a necessary condition for liberation, these metaphysical disputes were taken to be of practical as well as theoretical import.

Ontology is an attempt to answer the question "What is there?". But to answer that question we need to distinguish between the two separate, though intertwined, questions: "How many entities are there?" and "How many *kinds* of entities are there?". In both cases the metaphysically interesting answers are: "One", "Two", and "Many" (i.e. monism, dualism, and pluralism). Note, however, that a position about the number of kinds of entities that exist does not in itself entail any particular position about the number of entities that exist. Nor does a dualism or pluralism about the number of entities entail any particular position about the number of kinds of entities.

There was, correspondingly, quite a variety of Indian responses to the question "What is there?", including variants of monism, dualism and pluralism about both entities and kinds. Advaita, for instance, holds that there is numerically only one entity (*ātman/Brahman*) and that all plurality is illusory. Viśiṣṭādvaita qualifies this monism and maintains that while there exists only one ontologically independent substance (God), there also exist other

dependent entities (souls and material objects). Sautrāntika Buddhism, in contrast, holds that there are numerically many entities, but only one *kind* of thing: momentary particulars (*svalakṣaṇas*). Yogācāra Buddhism and Cārvāka also agree that there is only one kind of thing, but disagree about whether it is mental or material. Sāṃkhya-Yoga, on the other hand, asserts that reality consists of just two kinds of things but a plurality of entities: many selves (*puruṣas*) and a single evolving primal matter (*prakṛti*). Finally, Nyāya-Vaiśeṣika is pluralist about both entities and kinds: there are many things in the world, though there are only seven basic ontological categories (*padārtha*).

Underpinning these disagreements about the nature and number of reals are also important differences of opinion about the criterion of reality. According to the Buddhists, for instance, to be real is to be causally efficacious. For Advaita, however, the real is that which is never sublated (*abādha*) by any manner or means. Thus only *Brahman*, free from all limitations of space, time and individuality, is truly real.

In their systematic development of these differing ontologies Indian philosophers mostly utilized a common methodology. Since even the most revisionary Indian metaphysicians usually took seriously the defeasible deliverances of common sense, they often conceived of their task as the construction of a philosophical system which permitted all objects recognized by common sense to be reduced to logical constructions out of the favored primitive entities of the system. This general methodological stance is equally true, for example, of the Buddhist logicians (who favored an event ontology of momentary particulars), of Nyāya-Vaiśeṣika (who favored a rich ontology of univerals, qualities and substances), and of late Advaita (who favored an entity monism). Ontological disputes were less about the reductionist project

(Madhyamaka Buddhism is a notable exception), than about the details of the attempted reductions: e.g. do we really need to posit wholes as well as parts, substances as well as properties, universals as well as particulars, selves as well as mental states, and so on?

Many metaphysical topics were debated in classical India, but two of the most important were causation and the nature of the self. The Indian philosophers extensively discussed a number of issues relating to causation, including the nature of the causal relation, the definitions of cause and effect, and classifications of kinds of causes (Potter 1963, Smart 1964, Bhartiya 1976). Typically they stressed the importance of the material cause, rather than (as in Western philosophy) the efficient cause.

The Indian theories of causation are traditionally classified by reference to the question of whether the effect is a mode of the cause. According to this taxonomy there are two principal theories of causation. One is the identity theory (*satkāryavāda*) which holds that the effect is identical with the cause, a manifestation of what is potential in the cause. This is the Sāṃkhya-Yoga view, though that school's particular version of it is sometimes called transformation theory (*pariṇ āmavāda*). Advaita Vedånta holds an appearance theory (*vivartavāda*) which is often considered a variant of the identity theory. According to the appearance theory effects are mere appearances of the underlying reality, *Brahman*. Since only *Brahman* truly exists, this theory is also sometimes called *satkāraṇavāda* (the theory that the cause is real but the effect is not).

The other principal theory of causation is the non-identity theory (*asatkāryavāda*) which denies that the effect pre-exists in its cause and claims instead that the effect is an altogether new entity. Both Nyāya-Vaiśeṣika and the Buddhists are usually classified as non-identity theorists, but they differ on many important details. One of

these is whether the cause continues to exist after the appearance of the effect: Nyāya-Vaiśeṣika claims it does, the Buddhists mostly claim it does not.

Indian theories of the self also traditionally divide into two broad classes: those who explain diachronic personal identity by reference to an enduring substantial self (*ātmavādins*) and those who deny the existence of such a self, taking instead a "modal" view of reality (*anātmavādins*). The orthodox Hindu philosophers and the Jainas all take the former view. Although they disagree on the nature and number of such selves, they are all non-reductionists of some sort about personal identity. Most Indian Buddhist philosophers (including the Theravādins, the Vaibhāṣikas, the Sautrāntikas, the Yogācārins and the Svātantrika-Mādhyamikas) take the latter view and hence are all plausibly classifiable as reductionists about personal identity.

The selections in this volume open with an article by Matilal which helpfully sets out something of the basic ontological framework of Indian metaphysics. Matilal concentrates on the very different ontologies of Nyāya-Vaiśeṣika, Buddhism and Jainism. He contrasts the anti-substantialism of the Buddhists with the substantialism of Nyāya-Vaiśeṣika, and presents the Jaina conception of reality as an attempt to bring together the opposing viewpoints of the Buddhists (with their emphasis on becoming) and Nyāya-Vaiśeṣika (with their emphasis on being). It is worth noting that choice between the rival metaphysical systems was not made entirely on the basis of the *pramāṇas*. Rather the ontologies of the systems were defended holistically, though they were open to rational criticism (see Mohanty 1992).

Potter's paper on the *Vedāntaparibhāṣ ā* reveals in a most illuminating way how the conception of philosophy as systematic

reconstruction is shared not only by the realist logicians of the Nyāya-Vaiśeṣika school (Potter 1977), but also by the supposedly "mystical" Advaitins. The eighty-four interconnected definitions in Dharmarāja's text are all generated from a small base of primitive notions. The terms so defined are then used to constitute a rigorous philosophical system, in a fashion somewhat analogous to the constructionalist projects of Carnap and Goodman.

Indian approaches to the problem of universals are addressed in the succeeding articles by Chakrabarti and Siderits. Chakrabarti explains Nyāya-Vaiśeṣika's realist theory of univerals (see also Shastri 1964, Dravid 1972, Potter 1977, Mukhopadhyay 1984, Phillips 1995). According to the Naiyāyikas, universals are both simple and sensible, but there are also various restrictive conditions that prevent the admission of a universal corresponding to every common name. Nyāya metaphysicians accordingly admit universals to their basic ontology, but count as particulars both the inherence relations which bind properties to property-possessors, and various non-repeatable qualities (*guṇas*) such as color, magnitude, weight, shape, etc.

The Nyāya position on universals is thus objectionable both to some fellow realists, who think that qualities and relations should be counted as universals, and to nominalists who think that universals are entirely dispensable. Siderits' paper is concerned with both types of objection. He argues that (*pace* Dravid 1972) there is no incoherence in the notion of the qualities of a particular substance being themselves particulars. He also offers a rational reconstruction of the *apoha* theory of the Buddhist nominalists, who deny that the use of a general term like "cow" ever requires us to posit the existence of a corresponding universal cowness. To say of a particular that it is a cow is just to say that it does not belong to the class of things that are non-cows (see also Shaw 1978).

Nyāya-Vaiśeṣika metaphysicians admit to their categories of the real just six presences: substances, qualities, actions, universals, particularities, and inherence (Potter 1977, Halbfass 1992, Phillips 1995). But they also admit a seventh, and final category: absences (*abhāva*), or negative facts (Matilal 1968, Chakrabarti 1997). Gillon's article draws freely upon both Indian and Western philosophy to present a challenging modern defense of the Nyāya view that absences do indeed exist and that they are known not only by inference, but also by perception.

Any metaphysical reductionism requires a mereology, or theory of the part-whole relation. In India the two most developed mereological theories were those of Nyāya-Vaiśeṣika and the Buddhists. According to Nyāya-Vaiśeṣika, wholes are never reducible to their parts, though they inhere in them (Bhaduri 1975, Potter 1977). According to the Buddhists, wholes are unreal, mere conceptual constructions, and only parts are real. Kapstein's article reconstructs the Buddhist idealist Vasubandhu's arguments against the atomic theory of the Buddhist realists, arguments which utilize certain implicit mereological principles. Vasubandhu tries to prove idealism by demonstrating that the notion of composite material wholes entails that there are simple, atomic substances, and that atomism is false.

One of the most important relations in any plausible metaphysics is causation. Martial's article briefly explains the Nyāya-Vaiśeṣika theory of causation, contrasting it with the Ābhidharmika and Sāṃkhya theories. Essential to Nyāya causal theory (and to their metaphysics more generally) is the notion of inherence (*samavāya*), the relation that also connects wholes and parts, and substances and their qualities. The most popular Indian objection to the Nyāya theory of inherence is an infinite regress argument. If two entities *A* and *B* are to be related by the inherence relation *R* which is itself a

distinct entity, then it is also necessary that *A* and *R* be related by a different inherence relation *R**, itself a distinct entity. But then, of course, *A* and *R** have to be related by a yet different inherence relation *R***; and so on *ad infinitum*.

The Naiyāyikas reply that there is no regress because there is no other relation to connect inherence to its relatum. Clearly they cannot mean that the relatum and its relation are identical, for then, by the transitivity of identity, *A* would not only be identical with *R* but also with B! Instead Navya-Nyāya appeals to the notion of a self-linking connector (*svarūpasambandha*). The idea here is that while *A* requires the inherence relation *R* to connect it to *B, A* can be its own connector to *R*. Potter's paper, although not explicitly about Indian philosophy, is in effect an independent defense of the intelligibility of the notion of such a "concrete connector".

The most Indian famous critique of causality is that of Nāgārjuna, discussed at some length in the piece by Garfield (see also Garfield 1995). In a virtuoso dialectical display Nāgārjuna refutes all the standard types of Indian causal theory: (i) self-causation; (ii) external causation; (iii) both (i.e. self and external causation); and (iv) non-causation. But Nagarjuna does not deny causation *per se*. Rather causality is the Buddha's teaching of dependent origination: everything is interdependent and this is equivalent to the truth of emptiness (*śūnyatā*), that nothing has any self-existence or essence. Liberation is the realization of this emptiness.

Contrary to popular Western belief, the general Indian acceptance of universal causality and karma does not entail fatalism, as Potter explains in the succeeding article. However, there is a widespead Indian commitment to a fairly strong form of determinism. In the course of defending the compatibility of this

determinism with a kind of freedom of agency, Potter also develops an original argument for the existence of beginningless agents.

The remainder of the selections are concerned with Indian theories of the self. Central to early Buddhism is the doctrine of "no-self" (*anatta*), which denies the existence of an enduring substantial self (Collins 1982). The Ābhidharmikas developed this doctrine into a detailed reductionist account of persons that has certain parallels with the theory of personal identity recently developed by Derek Parfit (Parfit 1984). The articles by Duerlinger, Bastow and Siderits explore these parallels in some detail, and reach somewhat different conclusions. Duerlinger (invoking Candrakīrti) argues that reductionism is not the only Buddhist view, while Bastow and Siderits suggest that Buddhist reductionism has resources which can usefully fill lacunae in Parfit's theory.

In contrast to the Buddhists, the Hindu philosophers were all committed to the existence of an enduring substantial self (*ātman*), though there was lively disgreement among them as to the nature and number of such selves. One argument for the *ātman* (to be found in both Mīmāṃsā and Nyāya) is that personal memories of the form "I did this" presuppose the existence of a continuing substantial self. Taber explains the Mīmāṃsā version of the argument, and Chakrabarti defends a modern version of the Nyāya argument (see also Chakrabarti 1999).

The piece by Shukla is interesting for several reasons, including its contrast with Chakrabarti's. Translated from modern Sanskrit, it is a striking example of the vitality of the pandit tradition in India (see also Krishna 1991, Sankaranarayanan 1993). Working entirely within the context of traditional Sanskritic Nyāya scholarship, Shukla argues that considerations of ontological economy (*lāghava*) show that Nyāya should refuse to admit *ātman* as a separate

metaphysical category. Everything that the self was postulated to do in the system can be done by the (corporeal) *manas* or "mind" alone. Hence on this matter the Nyāya tradition requires rational revision.

Sāṃkhya-Yoga is the oldest school of Indian philosophy (Larson 1979, Larson and Bhattacharya 1987). It is committed to a sharp dualism between *puruṣa* (self) and *prakṛti* (matter, nature). The articles by Larson and Schweizer try to capture more precisely what this dualism amounts to, given that it is not equivalent to a Western mind-body dualism. Larson sees it as a kind of dualistic reductionism, Schweizer as a mind-consciousness dualism.

Advaita monism represents the most radical version of the *ātman* theory, according to which there is but one self which is identical with the Absolute *Brahman* (Deutsch 1969, Potter 1981). Deutsch's paper presents a "phenomenological" reconstruction of the Advaitin analysis of the self into a hierarchy of four levels of consciousness. Bhattacharyya's difficult but original piece presents a modern neo-Vedāntin perspective, influenced by Kant as well as the Sanskritic tradition (see also Bhattacharyya 1976).

ONTOLOGICAL PROBLEMS IN NYĀYA, BUDDHISM AND JAINISM A COMPARATIVE ANALYSIS*

The term 'Ontology' came to be used to indicate the most general part of metaphysics in seventeenth-century Europe, although for the origin of ontology as a general theory of real entities, or as a theory of being *as* being, one has to go back to Aristotle as well as to the pre-Socratic philosophers of ancient Greece. Aristotle did not use the term 'ontology'just as he did not use the term 'logic' either. But the history of logic as well as ontology in the Western tradition seems to start with him. Aristotle talks about a 'first philosophy', which, he says, is about being as being, and this is taken in later Western tradition to be the nearest analogue of 'ontology'. For our present discussion, I shall assume ontology to mean a general theory of 'what there is' and try to apply it to the Indian tradition. There are many other problems usually discussed in connection with ontology in the West, such as the doctrine of distinction of essence and existence, the theory of transcendental properties of all entities, but these questions will not directly concern us in this paper.

The Nyāya-Vaiśeṣika ontological problem was connected with the Vaiśeṣika doctrine of categories (*padārtha*), and the category of substance was the focal point of this doctrine. The system of Vaiśeṣika categories is generally regarded as a classification of real

and fundamental entities. It is also possible to view it as an analysis of the 'concrete' objects of our experience into their various parts in order to form a theoretical basis for our philosophical discussion. The Nyāya-Vaiśeṣika philosophers, however, believe that if we can analyse and classify the concrete object of our experience in this manner into substance, quality and action, we would achieve a satisfactory explanation of 'what there is', i.e., an explanation of what is meant when we say, 'that object exists'.

The Buddhists, on the other hand, think that the so-called concrete object of our experience is at best a synthetic object and hence is analysable into a number of fundamental properties or elements called *dharmas*. The Buddhist conception of a *dharma* is that it is by nature a non-substance (cf. *anātman*).[1] The question, 'What is there?' can be answered, according to the Buddhists, if we can prepare a satisfactory list of such non-substances or *dharmas*, which we can refer to while we are accounting for and analysing the objects of our experience. The *dharmas* are also in perpetual flux, 'in a beginningless state of commotion', and *nirvāṇa* is posited as the ultimate cessation of this 'commotion' for a person. Nirvāṇa is also said to be the ultimate reality, the ultimate nature of things, to be contrasted with the phenomenal existence of *dharmas*, but, as I have already indicated, this problem will not be our concern in this context.

Our prephilosophical common-sense tells that there are around us things which somehow undergo change. Our philosophical worries start along with our recognition of the phenomenon of change vis-a-vis our feeling for continuity and sameness underlying change. In India this problem was reflected in the old dispute over *Sat*-cosmogony versus *Asat*-cosmogony (found in the Ṛgveda as well as in the Upanishads). The philosophic resolution of this dispute is to be found in the two rival theories about causation and creation in

ancient India: 1. *sat-kārya-vāda* 'the theory of pre-existence of the effect in the cause' and 2. *asat-kārya-vāda* 'the theory of new creation of the effect which was non-existent before'. For those who prefer a comparative approach, it is significant to note that the so-called paradox of change and permanence, of being and becoming, was as much a live issue for the early Indian philosophers as it was for the Greeks, i.e., the pre-Socratics. Those who were inclined toward permanence not only posited the notion of an enduring substance but also argued that change was only superficial transformation of the existent (the substantial) from one state to another. The Sāṃkhya and the early Vedānta belonged to this group insofar as they gave prominence to *Sat* 'the existent'. The Vaiśeṣikas belonged to the group of *Asat* cosmologist inasmuch as they admitted change to be real and the function of the cause to be the creation of new things, effects. But they also posited the doctrine of substance, in fact, plurality of substance, and their substantial elements were said to be persistent through changing states. The Buddhist *Asat* cosmologists were very radical, for they argued that change alone was real and the notion of continuity or persistence was illusory, and the notion of soul-substance was a myth. The Jaina theory, as we will see later on, was a compromise between the Buddhists and the Nyāya-Vaiśeṣika.

The ontological positions of Nyāya-Vaiśeṣika, Buddhists and Jainas were necessarily influenced by their respective stands on the problem of change and continuity. The Buddhists, for example, were pre-eminently anti-substantialists in the Indian tradition. This anti-substantialism culminates in their 'flux' doctrine, according to which the components of every object, all *dharmas*, change completely from moment to moment. A comparativist might be reminded here of the anti-substantialism of Heraclitus of Ephesus, who held, contrary to Parmenides' denial of change, that change was

incessantly occurring. But it is not certain that the Heraclitean acceptance of change as reality amounted to the 'flux' doctrine, as it was understood by both Plato[2] and Aristotle.[3] The 'flux' doctrine may be due to an interpretation of the Heraclitean position by the philosopher Cratylus. This would at least give credence to the anecdote related by Aristotle about the 'river' example of Heraclitus. Aristotle says that Cratylus "rebuked Heraclitus for saying that you could not step twice into the same river; he (Cratylus) thought you could not even do so once."[4] Thus, probably Cratylus was much closer to the Buddhists in this regard.

The Nyāya-Vaiśeṣikas, on the other hand, were substantialists while they accepted also change much in the same manner as Aristotle. But we need not proceed in this comparative vein any further. It is important to understand now the Nyāya-Vaiśeṣika doctrine of existence as well as their notion of substance. Vaiśeṣika-sutra 8.14 asserts that what exists can be analysed into three categories, substance quality and action.[5] Existence in this system is regarded as a generic property common to the members of the three classes, substance, quality and action. Each of these classes has a class-property or generic property, viz., substance-ness, quality-ness and action-ness; but these generic properties are to be distinguished from 'existence' as a generic property.[6] Candramati, in fact, regarded existence as a separate category (*padārtha*) altogether while class-properties like substance-ness were included under the category of 'generality' (cf. *sāmānya* or *sāmānya-viśeṣa*). But Praśastapāda interpreted 'existence' as the highest generic property and thus brought both existence, on the one hand, and other class-properties like substance-ness and quality-ness, on the other hand, under one category (*padārtha*) called generality.[7] But still a special place was accorded to existence as the all-inclusive generic property which should be distinct from the included (*vyāpya*) generic

properties such as substance-ness and quality-ness. A particular substance is characterized by the *being* of substance or substance-ness much as it is also characterized by many qualities and probably by some actions. But it is also characterized by 'existence' (inasmuch as it exists) which is not to be identified with its substance-ness or with any of its quality.

The best way to explain the notion of existence in this system is to contrast it with the notion of 'real' as well as with that of the non-existent. Existence along with other included generic properties are themselves REAL but not EXISTENT. For, otherwise, we will have to indulge in talking about the existence of existence and so on *ad infinitum*. Similarly, the important relation called *samavāya* that combines the generic property existence with the particular existents, such as a substance or a quality or an action, is also regarded as REAL but not EXISTENT.[8] Thus, the generic properties and their inseparable relation with the particulars are posited as real, as means of explicating the notion of existence. Hence they themselves should not be construed as 'existents' to avoid the problem of self-dependence and regress but nevertheless, these notions, existence, generalities and *samavāya*, are claimed in this system to be real in the sense of their being independent of our thought or mind and thus being distinct from a non-entity. A non-entity is NON-EXISTENT and hence unreal, for example, the sky flower, the son of a barren woman, the rabbit's horn and the unicorn.

Briefly stated, the 'Existents' in this system (early Vaiśeṣika) are equivalent to the particulars, such as a chair, a particular color, a particular action. The class of existents is a sub-class of the class of reals. Universals (including relations) are not thus EXISTENTS but REALS. Praśastapāda used two significant notions in order to separate the class of existents from that of universals: *sattā-sambandha* and *svātmasattva*. The first notion characterizes each

existent, for it means that EXISTENCE resides in the particular entity by *samavāya* relation. The second notion became a bit puzzling for the later commentators. Udayana explains it as 'lacking existence' (*sattā-viraha*). Śrīdhara gives almost the same interpretation but also points out that 'existence' could be ascribed to the universals only by mistake. Vyomaśiva says that while the first notion means that EXISTENCE is correctly applied to the class of particulars, the second notion means that EXISTENCE is only metaphorically applied to the class of universals.

The riddle of existence and non-existence is further complicated in the later Nyāya-Vaiśeṣika by the acceptance of negative properties as real. Our negative statements, according to the later Nyāya-Vaiśeṣika, are expressions of something, some negative facts. The affirmative-negative dichotomy among judgments is interpreted differently in this system. Thus, just as a positive judgment attributes a positive property to a thing so also a negative judgment attributes another property, a negative one, to the thing denoted by the subject-term. Just as a positive property predicated by a judgment can be construed as a real property, so also a negative property, absence of some positive property, predicated by a judgment can be construed as a real property. Thus, 'the room is dark' can be interpreted as expressing the room that is characterized by the property of absence of light. Now, this property, absence of light, and the like, are regarded by the Nyāya-Vaiśeṣika as REAL inasmuch as they are to be distinguished from the unreal such as the round square, and unicornhood. But again, care should be taken to note that the absence of light is not however EXISTENT in this system in the sense a substance or a quality or an action is existent. It may also be noted that although the negation of an entity is construed in this system as expressing absence of that entity, a so-called negative property, no non-entity like the sky flower or the unicorn can be

negated (in other words, absence of such non-entities will not be an acceptable negative property in this system).[10]

Leaving aside the riddle of existence and non-existence, let us concentrate on the Nyāya-Vaiśeṣika doctrine of substance and quality, which was at the focal point of their ontology. Several notions of substance have been emphasized in the Vaiśeṣika at some time or other: 1. substance as the locus of qualities and actions,[11] 2. substance as the substratum of change,[12] and 3. substance as capable of independent existence.[13] It is difficult to say whether the concept of substance as the logical subject was at all implied in early Nyāya-Vaiśeṣika doctrine, for it was never thoroughly worked out. Later Nyāya and Buddhist logicians (notably Diṅnāga) developed the concept of *dharmin* 'property-possessor' which was the nearest Indian analogue for 'logical subject'. But this concept was regarded as neutral to the ontological beliefs of the logicians. The concept of substance as the unchanging 'essence' was prevalent in the Sāṃkhya school as well as in the early Vedānta (cf. the spiritual substance), but this concept was not treated seriously in the Vaiśeṣika school. It is also to be noted that the Mādhyamika Buddhists were uncompromising critics of the doctrine of *sva-bhāva* 'own-nature' which was analogous to the notion of essence or inner immutable core of things.

The doctrine of substance as the substratum of change needs further elaboration in the present context, for this will throw much light on the Vaiśeṣika theory of causation and change. For any effect, the Nyāya-Vaiśeṣika will identify a particular substratum cause (*samavāyi-kāraṇa*) in which that particular effect is supposed to inhere. If the physical conjunction of two material bodies are taken to be the effect in question, its substratum cause will be the two bodies themselves. If the taste of a fruit is regarded as the effect, its substratum cause will be the fruit-stuff itself. But when the effect is

nothing but a concrete individual like a pot, its substratum cause will be the pot parts, or in final analysis, the atomic constituents of the pot material. Thus, the substratum cause of an effect need not be an ever unchanging substratum. We do not have to posit an unchanging substantial core as the locus of change. What is needed is only the temporal stability, persistence through a period of time, of the substance which acts as the locus of the effect.

The substances are, according to the Nyāya-Vaiśeṣika, either impermanent (having origin, stability and decay) or permanent (without origin or decay).[14] Material bodies of intermediate size (called *avayavin* 'whole' in this system) like a pot or a table are of the first type. They have temporal stability and can be the loci of qualitative change. These substances are breakable into parts and those parts into further parts. But the atomic constituents of these substances along with other non-material substances such as soul, sky, time and space are of the second type, i.e., permanent. An important part of this doctrine of substance is the ontology of the 'whole' (*avayavin*) as distinct from the assemblage of parts. A material body, e.g., a piece of chalk, is a whole which is a distinctly existent entity to be distinguished from the integration of its parts or combination of its atomic constituents. It is a new entity that is created as soon as the parts or atoms are put together. Moreover, draw a line on the board with this piece of chalk and you have created a new piece, for some parts of the old one are lost. The seeming identity of the new one with the old piece works for all our practical purposes, but ontologically the two are distinguishable.

The Buddhist anti-substantialism finds its extreme expression in the Sautrāntika doctrine of momentariness. According to this doctrine, a seemingly stable object like a chair is dissolved into a cluster of continuously fluctuating chair-moments or chair-stages. The real entity is a point-instant, an exclusive particular, an essentially

unqualifiable, ineffable 'here-now' subject. Everything else in this system is only a conceptual construction – an interplay of the commonly shared imagination. In what sense does a moment exist? A moment exists insofar as it functions in some way or other. Thus, Dharmakīrti has argued that *to be* means to be capable of functioning in some way or other.[15] If a thing does not have causal efficacy, it does not exist. Starting from this initial position, Dharmakīrti and his followers have formulated a proof of their 'flux' doctrine. It will be interesting to note the crucial steps taken by the Buddhists in proving the 'flux' doctrine:[16]

1. To be is to do something, i.e., to function or to have causal potency.
2. To have causal potency means to be actually doing what is supposed to be done.
3. If something has causal potency at a particular moment it must do its work at that moment. (This is a rephrasing of 2.)
4. If something does not do a work at a given moment, it must be causally *impotent* to do that work. (This is a contraposition of 3.)
5. The same thing cannot be both causally potent at one moment and impotent at another (next) moment, for potency and impotency are contradictory properties, mutually incompatible.
6. Therefore, the thing at the moment of its potency must be held onto-logically different from the thing at the moment of its impotency. A difference in qualities implies difference in the thing itself!
7. Everything, in this manner, can be shown to be in perpetual flux. We cannot step twice into the same river!

The most crucial step is taken by the Buddhist here when he identifies causal potency with actuality or actual doing. In other words, the notion of potentiality is completely rejected. If a thing

exists and it is capable, it must function without lying in wait for anything to come and help. If we posit two different functionings at two different moments, we have to construe them as belonging to two different things or objects. In each moment a new object (*bhāva*) emerges when a new functioning sets in and the old functioning perishes. Thus, what exists is the ever fluctuating here-and-now. Even the ontology of stages or moments is not quite satisfactory to the Buddhists. For moments or stages are also hypothetical abstractions in the face of continuum. Thus, we have to say that there is only process, only flux, without something being there to fluctuate. There is only transmigration without there being any transmigrating soul (cf. the 'non-soul' doctrine).

Udayana, setting forth a defence for the Nyāya-Vaiśeṣika doctrine of substance, has criticized the above argument of the Buddhist by pointing out that it is essentially dependent upon the total rejection of the notion of potentiality. Why, asks Udayana, is it to be assumed that the causally potent cannot (and should not) 'wait' for its accessories. Causality operates with two mutually compatible notions: *svarūpayogyatā* 'potentiality' and *phalopadhāyakatā* 'actuality'; the former relates to the general while the latter relates to the particular. If the Buddhist equates potentiality with actuality then, Udayana argues, part of the Buddhist argument is reduced to tautology, for he would have to say that *x* is actually functioning because it actually functions. And tautology is not a good philosophic argument. In fact, potentiality is explained by Udayana not as an essential constituent of the thing, but as the *mere presence of the thing coupled with the absence of some accessory or other and the consequent absence (or non-arising) of the effect.*[17] Thus, Udayana argues, if *x* does not cause *y* when and only when *z* is absent then it follows that when *z* is present *x* produces *y*. This is only another way saying that *z* is an accessory to *x* in bringing about *y*. Besides, the

properties of causing *y* and not causing*y* are not two mutually incompatible characters like cow-ness and horse-ness. A cow, of course, can never be a horse. But a thing, if it is not just a flux, can cause *y* at time t_1 and may not cause *y* at time t_2.[18] In fact, what Udayana says is reminiscent of Aristotle's rejection of potentiality:[19]

There are some who say, the Megaric school does, that a thing 'can act only when it is acting, and when it is not acting it 'cannot' act, e.g. that he who is not building cannot build, but only he who is building, when he is building; and so in all other cases. It is not hard to see the absurdities that attend this view.

It is rather significant that the arguments and counterarguments of Dharmakīrti and Udayana were presupposed much earlier in the Megaric school as well as in Aristotle.

Dharmakīrti's argument to prove his 'flux' doctrine was not entirely an innovation in Buddhist tradition. He must have derived his idea from Nāgārjuna's dialectic. Nāgārjuna, for example, has argued that if something exists it should exist always, and if it does not exist at one time it cannot exist at any time.[20] This is how Nāgārjuna has criticized the concept of existence and 'own-nature'. Dharmakīrti first assumes that *to be* means to have causal potency. Then he argues: if something has causal potency it must be functioning all the time, and if something does not have the causal potency at one time it would never have it at any other time. But Nāgārjuna's philosophic conclusion is rather different from that of Dharmakīrti. With the above argument Nāgārjuna wishes to avoid the extremes of eternalism and annihilationism and follow the Middle Way. Dharmakīrti, on the other hand, intends to conclude that since functioning is instantaneous, existence is also instantaneous. And when we think of Udayana's counterargument, we are again reminded of Aristotle:[21]

Again, if that which is deprived of potency is incapable, that which is not happening will be incapable of happening; but he who says of that which is incapable of happening either that it is or that it will be will say what is untrue;.... But we cannot say this, so that evidently

potency and actuality are different (but these views make potency and actuality the same, and so it is no small thing they are seeking to annihilate),....

The Jaina ontological position is influenced by both the Buddhists on the one hand and the Nyāya-Vaiśeṣika on the other. The Jainas were also substantialist, but in a very qualified sense of the term. Their conception of existence (*sat*) is intimately related to their doctrine of substance. The *Tattvārthasūtra* 5.29 asserts: "What there is, has the nature of substance."[22] And the next sutra (5.30 in the Digambara tradition) adds: "What there is (the existent), is endowed with the triple character, origin, decay and stability (persistence)."[23] The *Tattvārthabhāṣya* explains that whatever originates, perishes and continues to be is called the existent; anything different is called the non-existent.[24] The next sūtra asserts that the existent is constant for it never gives up its being (essence?).

In sūtra 5.37, the substance is again characterized as the possessor of qualities (*guṇa*) and modes (*paryāya*). Here the broad category 'attribute' is apparently broken into two sub-categories, qualities and modes. But the distinction between qualities and modes is not found in the sūtra. Umāsvāti points out that qualities are permanent attributes of the substance while the modes are only temporary attributes which are subject to origin and decay.[25]

In the above analysis of the *Tattvārthasūtra*, two compatible notions of substance are emphasized: 1. substance as the core of change or flux and 2. substance as the substratum of attributes. Kundakunda combines these two notions as he defines substance in his *Pravacanasāra*:[26]

They call it a substance, which is characterized by origin, persistence and decay, without changing its 'own-nature', and which is endowed with qualities and accompanied by modifications. For the 'own-nature' of the substance is its existence (*sad-bhāva*) which is always accompanied by qualities and variegated modes, and at the same time, by origin, decay and continuity.

The Vaiśeṣika school, as we have seen already, emphasized both these aspects of substance, but did not equate the 'own-nature' of the substance with EXISTENCE. Aristotle, who in fact suggested several notions of substance either implicitly or explicitly, remarked in *Categories*:[27]

The most distinctive mark of substance appears to be that, while remaining numerically one and the same, it is capable of admitting contrary qualities.

In *Metaphysics*, Aristotle also implied that the substance is what is independently existent, for existence, in the proper sense of the term, applies to substances only, and qualities and relation have a secondary existence, a parasitic mode of being:[28]

Therefore, that which *is* primarily, i.e., not in a qualified sense but without qualification, must be substance.

The Jainas too, identify the notion of 'it is' or 'it exists' with that of substance, and they then explain that 'it is' means that it is endowed with the triple character of origin, decay and stability.

In fact, the Jainas explicated the notion of substance in such a way as to avoid falling between the two stools of being and becoming. It was a grand compromise of flux and permanence. The Jainas inherited from Māhavīra and his later followers the well-known doctrine of 'many-natured' reality (cf. *anekānta-vāda*), and thus a 'compromise' position was only an important trait of their creed. The substance, in their analysis, is being, it is also becoming. Kundakunda observes that a substance has both natures: from the standpoint of one 'one-nature' it is being (*sat*, unchanging), and from another standpoint it has triple character, origin, decay and continuity, i.e., fluctuations.[29] Siddhasena Divākara repeated the point more forcefully:[30]

There is no substance that is devoid of modification, nor is there any modification without an abiding something, a substance. For origin, decay and continuance are the three constituents of a substance.

It should be noted that the notion of continuity involved in the triple character of the substance is not identical with the notion of permanence of the substance. The former notion means persistence or continuance (cf. *pravāhanityatā*). The later notion means immutability. It is the notion in the background of which the triple character of origination, destruction and continuity becomes understandable. The notion of continuity, on the other hand, is essentially dependent upon origin and decay. Thus, Kundakunda observes:[31]

There is no origin without destruction, nor is there any destruction without origin, and neither destruction nor origination are possible without what continues to be.

The Jainas were well aware of the Mādhyamika critique of the 'own-nature' concept as well as the problem involved in the doctrine of the permanent substance. It is true that the immutability of own-nature invites a host of problems. But the notion of flux, the Jainas points out, is not sacrosanct. Thus, just as the Buddhists argue that there is only fluctuation, there being no permanent being, the Jainas take the bull by the horns and answer that if there is no permanence there cannot be any change, any fluctuation, for it is only the permanent that can change. It is only the persisting soul that can transmigrate!

When the *Tattvārthasūtras* defines substance as the substratum of qualities and modes, it was probably influenced by the Vaiśeṣika school. Thus, Siddhasena points out that the rigid Vaiśeṣika concepts of substance and quality were not compatible with the Jaina ontological principle of *anekāntatā* 'many-naturedness' or 'non-onesidedness'. In fact it would be as good as a heresy in Jainism if one intends to maintain a rigid distinction between substance and quality. The notion of triple character, origin, decay and continuity, embodying the principle of (conditioned) reality, was derived from the Buddhist source. The Buddha, for example, predicated this triple

character of all the conditioned (*saṃskṛta*) entities. Thus, in the *Aṅguttara* I, the Buddha said:[32]

Of the conditioned entities, monks, the origin is conceived, even so their decay and their stability (persistence).

Nāgārjuna, however, directed his dialectical attack against the notion of the conditioned (*saṃskṛta*), and concluded:

Since the notion of origin, persistence and decay cannot be established, the conditioned does not exist. And if the conditioned is not established, how will the unconditioned be established?

But why then did the Buddha speak about the triple character of the conditioned entities? Nāgārjuna replied:[33]

Just as magic, dream and the cloud-castle are unreal (but, nevertheless, are spoken about) so also origin, stability and decay have been described.

The Jainas postulate the triple character in the case of each event, each happening or change of state. Each fluctuation embodies origin, continuity and decay. Samantabhadra illustrates the point as follows: if a golden pot is destroyed and a golden crown is made out of it, destruction, origination and continuity – all three – happen simultaneously and give rise to sorrow, joy and indifferent attitude in the minds of three different kinds of people, those in favour of the pot, those in favour of the crown, and those in favour of the gold stuff.[34]

Siddhasena has shown great philosophic insight in expounding the Jaina ontological problem. According to him, reality can be viewed from two important standpoints, being and becoming, permanence and change. That is why Lord Mahāvīra acknowledged only two *nayas* or standpoints: 'substance exists' and 'modification exists'. If *x* is an element of reality, then, according to Siddhasena, *x* can be viewed as a SUBSTANCE from the standpoint of being, and as a PROPERTY from the standpoint of becoming. The standpoint of 'becoming' (modification) reveals that everything originates, stays

and perishes; the standpoint of 'being' ('it is') reveals everything as existent, eternally without birth or decay. And, Siddhasena asserts, there cannot be being without becoming, or becoming without being; therefore, a substance (= reality) is defined as the combination of being (the existent) with becoming (origin, stability and decay).[35]

The 'being' aspect is, according to Siddhasena, the result of generalization while the 'becoming' aspect is that of particularization. In our ordinary description of things, we necessarily combine the general with the particular. From the point of view of the highest generalization, a thing is described as 'it is' which reveals the permanent being, the substance. But when, in ordinary descriptions, a thing is called a piece of wood, or a chair, or a red chair, we have an intermixture of 'being' and 'becoming' aspects. Insofar as the thing is identified as a non-fluctuating substance, it is the 'being' standpoint. And insofar as the attributes of the thing, such as being a piece of wood, being a chair, or redness, are revealed by the description, it is the 'becoming' standpoint. Qualities are nothing but modes or states of the substance. In any characterization or description of the thing there is thus an overlap of 'being' and 'becoming' standpoints, until we reach the ultimate particularity, pure BECOMING, i.e., the point-instants (*kṣaṇas*) of the Buddhists.[36]

Thus, the Jaina conception of reality, in bringing together the opposing viewpoints of the Buddhists and the Nyāya-Vaiśeṣika, comes very close to that of Whitehead, according to whom the chief aim of philosophy is the "elucidation of our integral experience", of both the flux and permanence of things. Whitehead has said that philosophers who have started with 'being' have given us the metaphysics of 'substance' and those who have started with 'becoming' have developed the metaphysics of flux. But Whitehead point out the inseparability of the two:[37]

But, in truth, the two lines cannot be torn apart in this way; and We find that a wavering balance between the two is a characteristic of the greater number of philosophers. Plato found his permanences in a static, spiritual heaven, and his flux in the entanglement of his forms amid the fluent imperfections of the physical world.... Aristotle corrected his Platonism into a somewhat different balance. He was the apostle of 'substance and attribute', and of the classificatory logic which this notion suggests.

In the Indian context, one may observe that the Buddha's search for *nirvāṇa*, the unconditioned state, freedom from suffering or *duḥkha*, spelled out a philosophy for the later Buddhists, according to which the flux of things, impermanences, "the fluent imperfections of the physical world" are identical with suffering (*duḥkha*, cf. whatever is impermanent, is suffering). And NIRVĀṆA, the unconditioned state, is actualized with the cessation of this *duḥkha*. The Vaiśeṣikas, on the other hand, were, much like Aristotle, the apostles of substance-and-attribute duality.

NOTES

VEDĀNTAPARIBHĀṢĀ AS SYSTEMATIC RECONSTRUCTION

The *Vedāntaparibhāṣā* (VP)[1] of Dharmarājadhvarindra (fl. c. 1615) is frequently indicated as an introductory handbook for the study of Advaita Vedānta, analogous to such works as the *Tarkasaṃgraha* for Nyāya, or the *Mīmāṃsāparibhāṣā* for Pūrvamīmāṃsā. To identify it in this way is, however, perhaps to miss the VP's most significant and remarkable feature, which is that it represents the most obvious case of philosophy as system construction found in Advaita literature. The significance and remarkability of this is that it gives the lie to a mistaken impression often disseminated about Advaita, which is that it is by the very nature of its thought mystical, unsystematic or even antisystematic. While those acquainted with Advaita literature are likely not to be victimized by this mistaken impression, it is a common enough one to be worth exposing, especially since it is sometimes implied that it is precisely this mystical, un- or anti-systematic nature which constitutes the glory of Advaita. The *Vedāntaparibhāṣā*, I shall attempt to show, is systematic in a rigorous sense of the word, and it is instructive to view Advaita in its terms, which stand at the culmination of a history of many centuries of careful work of developing Advaita as system.

When I say that the *Vedāntaparibhāṣā* is "systematic" in a rigorous sense of the word, what do I have in mind? In a general sense, a system is an ordered exposition. But there are various ways of achieving order. Dharmarāja's work, I wish to argue in this paper, is

instructively viewed as an especially rigorous kind of ordered exposition, an exposition organized in terms of a series of interlocking definitions derived from a small number of primitive terms.

I

Dharmarāja's work turns around some 84 definitions. Definitions are, of course, not new to Advaita in the *Vedānta-paribhāṣā*: they are a regular part of Advaita, and of Indian philosophy generally, since its earliest beginnings. What makes Dharmarāja's definitions unusual is that they are interconnected with each other so that all of them can be generated from a small base of primitive notions. This is what I shall attempt to set out— though necessarily only partially—in what follows.

But suppose that I can show that these definitions are connected in this way, why do I suppose that is an interesting result? One may well doubt whether any purpose other than an aesthetic desire for elegance is served by relating a lot of definitions in this way. In order to answer this doubt I need to indicate how system-construction can be seen as a most powerful, as well as elegant, way of carrying forward a philosophical program.

One of the most important books of 20th century philosophy, a work too little known, is Nelson Goodman's *The Structure of Appearance*.[2] In it, a certain philosophical program is carried forward through system-construction; furthermore, one finds in the pages of Goodman's book, as well as in other published pieces of his, valuable observations and arguments concerning the nature and value of system-construction in the manner of SA (as I shall call Goodman's book and the system it develops). While I cannot do justice in a

single lecture to the depth and breadth of Goodman's analyses, I shall have SA very much in mind as I proceed.

Let us start from some truisms about what philosophy is, or may be, about. A philosopher, perhaps among many other things, sometimes attempts to clarify and explain a certain subject-matter in keeping with some purpose or set of purposes (such as clarification of meaning; discovery of truth) to which he is committed. Thus he might be thought of as a kind of mapmaker: he explores a territory and "maps" it in such a way as to enable those who use his map to find their way around in the territory assuming they are guided by the kind of purpose(s) he had in mind. So, a highway map of Italy helps a motorist to proceed from Naples to Rome, to identify towns near the main route if they wish to deviate for lunch, and so on. The relativity to purpose of a map is a point worth noticing. A mapmaker is not trying to recreate the territory: as Goodman says, "let no one accuse the cartographer of merciless reductionism if his map fails to turn green in the spring."[3] Recreating the domain is not what the mapmaker is up to.

In the case of highway mapmaking the domain is clear enough: it is provided by the features of the territory being mapped, those features which are relevant to the purposes in point, viz., getting from here to there most efficiently and by established roads, etc. But mapmaking is evidently an analogy: a philosopher is not a cartographer in the literal sense of the term. And so one may well ask: what is the domain the philosopher treats in a fashion analogous to the way the cartographer treats a territory of space?

There is no single answer to that. Philosophers have had various purposes in mind, and in turn these picked out various aspects of things as worthy of their attention. But we may be able to devise a general way of speaking about the domains of philosophical

explanation if we consider another way of thinking about what the mapmaker does. We could say that the highway mapmaker, considering a domain and having in mind serving a certain purpose, provides a method of giving a clear answer to all questions which a motorist might raise about his relative location to roads and towns and whatever else he needs to know to satisfy his purposes as motorist trying to get from one point in the domain to another. Thus, one might say, the map provides the motorist with a way of answering all such questions (perhaps within certain restrictions which are understood implicitly or explicitly). Or, to put it another way, if we consider all the things a motorist might say about his relative location *vis-à-vis* roads and towns (e.g., "I am going north from Naples," "Rome is 20 kilometers ahead," etc.), the map tells us which of those statements are true and which are not true, i.e., which ones to trust and act upon and which ones not to. Likewise, we can conceive of the philosopher providing a similar service for those oriented toward the purposes the philosopher has in mind serving. Whatever that purpose is, the philosopher will produce a translation manual in which, for every statement germane to that purpose (and within certain restrictions which are understood implicitly or explicitly) there either is a translation ofthat statement in the manual, or a translation of its contradictory, or neither, but not both. If there is a translation in the manual, that shows the statement to be true; if of its contradiction, that shows the statement to be false; and if neither, that shows the statement to be confused or irrelevant or that it conflates more than one statement, so that it is neither true nor false *simpliciter*, though it may or may not be related to statements in the manual in other ways. Once again, the set of statements in the manual provides a way of telling which of the original statements to trust, and which not.

We have, then, the conception of a system as a translation manual or scheme the input into which is a set of ordinary language statements and the output from which consists of translations of some of these together with clarification of the others. The limits on the input sentences reflects the philosopher's choice of the purposes he wishes to serve and the domain over which he wishes to range in his translations. Philosophy is frequently philosophy of something—philosophy of science, philosophy of mathematics, philosophy of art, political philosophy, and so on—and these descriptions identify in a general way what sorts of statements those kinds of philosophers are concerned to translate. Of course, "philosophy of science," etc., are merely very general rubrics, and we can hardly expect them to classify neatly all the purposes and domains philosophers commit themselves to.

We have, then, the conception of a philosopher constructing a translation manual for a group of ordinary language statements picked out in reference to a purpose and a domain. But why should he do such a thing? What's wrong with the statements in the first place? Why do they need translating? The answer, of course, is that ordinary thinking about a domain and a purpose may be very fuzzy. Our language and concepts are frequently infected by vagueness and ambiguity, with the result that confusions arise, and we sometimes act on the basis of statements which are either flatly false or else so confused that they provide little or no basis for successful action. So, the translation manual should be written in a language which is, by comparison with ordinary language, precise, unambiguous, and whose statements are consistent with one another. Thus, just as a map is a bad one if its design is vague, its symbols ambiguous, and the directions as to how to proceed derived from it inconsistent with each other, a translation manual is a bad one if its syntax and/or terms are vague and ambiguous and if its

constituent statements are mutually inconsistent, and for analogous reasons.

To put it in more formal terms, the criteria for a successful translation manual include internal (1) consistency with each other of the sentences in the manual and sufficient (2) clarity to enable a person using the manual to manage the domain and achieve the purpose delimiting the scope of the manual. To these we may add a few other criteria. First, the manual must be able, at least in principle, to translate *every* ordinary language statement falling within the limits of the domain and purpose. This criteria I shall call (3) adequacy. The manual must give us a workable basis for making decisions as to how to achieve the purpose, so that by acting on those decisions we succeed in achieving the purpose. This criterion I shall call (4) accuracy. And the manual must be intelligible yet powerful, which is to say that the audience for whom the manual is intended should be able to understand the terms in which the translations are couched as clearly derived from a small basic vocabulary with which he is, or can be made to be, familiar and which is itself sufficiently clear. This criterion I shall call (5) economy. To revert to the analogy of mapping in order to shed some further light on the last three criteria, it should be apparent that if a map only shows *some* features, say, only some roads relevant to the purpose, but not others it is less satisfactory than a map which shows *all* such features, i.e., it is relatively inadequate. A map which is misdrawn, so as to direct a person trying to get to Rome towards Florence instead, is inaccurate. And a document with no key to its symbols, or which uses a different symbol each time for recurrent features, is hardly worth calling a map. To the extent that inconsistency, unclarity, inadequacy, inaccuracy and lack of economy infect a translation manual, to that extent it is less satisfactory than we might hope.

What might be the organization of a translation manual that would be most likely to satisfy, or best approximate to satisfying, these criteria? It should be written in a language that its intended users can understand, a language which is recognizably connected with the ordinary language in which the sentences to be translated are couched, so that it will be evident that those sentences are indeed being translated. Yet the point of the translation is not, of course, to reproduce the deficiencies (unclarity, inconsistency, etc.) inherent in the sentences to be translated. The translations in the manual must be in a "clarified" version of the language, one in which both the syntax and the semantics of the translation sentences are carefully controlled so as best to achieve satisfaction of the criteria mentioned. Goodman argues cogently that what this conception of the philosopher's task suggests is the construction of a *system* of *definitions*.

The translation manual should be organized around definitions. These definitions, notice, are definitions in the manual, i.e., they are not definitions of the concepts of the manual in terms of the concepts of the language to be translated. Nevertheless, since the language of the manual must be intelligible to users of the language being translated, this means that the definitions must ultimately be couched in terms understandable and explicable in the ordinary, presystematic language and so subject to whatever unclarity is inherent in those presystematic understandings and explications. For this reason alone, the fewer "primitive," that is, undefined terms that the definitions rest on, the fewer opportunities for confusion. By minimizing the occasions for confusion through depending on as few primitive terms as possible, we also minimize possible inconsistencies that might crop up if we failed to follow a rigorous and systematic way of proceeding from definition to definition. This suggests that the definitions should constitute a system, i.e., an

interconnected group of translations involving the primitive and defined terms organized through the interconnections among those terms. In short, the procedure is to select a few primitive terms—as few as we can get away with—and then to define other terms in terms of those primitives, still others in terms of the stock of defined terms plus primitives at hand at a given point in the process, and so on until we have provided a vocabulary in which every sentence in the domain and relevant to the purpose finds a translation into that vocabulary.

That is the rationale for system-construction of the sort that Goodman practices in SA. He takes his cues to some extent from an earlier exercise in system-construction. Rudolf Carnap's *Die Logische Aufbau der Welt*,[4] Indeed, Goodman provides an analysis and critique of Carnap's construction in SA itself.[5] Since I am more familiar with Goodman's own system, and since it is written in English, I shall spend a bit of time characterizing the system constructed in SA as an illustration of the sort of translation manual I have been talking about.

Goodman points out that in going about constructing a system one must initially make three kinds of choices. First, one must decide what sort of syntax, that is to say, what logical connectives one will use in forming the sentences of the translation manual. Goodman's own choice here is to use standard quantificational symbolic logic of the sort developed in *Principia Mathematica* and commonly taught in logic classes today in American and British universities. It might be noted that, in apparent contradiction to something I have just said, the language of the manual, symbolic logic, does not look like the language of the sentences to be translated into it, which is ordinary English. Goodman notes this but points out that there is no problem since every interpreted symbolic formula which appears in the manual can be rephrased into English; the advantage of the formula

is clarity and rigor, the value of the English rephrasing is intelligibility, and they are both present, though requiring distinct representations, in the sentences of the manual as Goodman conceives them. Standard quantificational logic contains as elements logical connectives, variables and quantifiers, predicates and names. Goodman's plan is to represent the syntax of the sentences in his translation manual, i.e., his systematic translations, by using formulae of standard quantificational logic together with their English equivalent expressions.

The second choice a system-constructor has to make, Goodman tells us, concerns the ranges which the variables will be taken to cover and the kinds of things the names appearing in the formulae will be allowed to denote. The reason why this is an important choice is that it may be thought—and is so thought by Goodman—to represent an initial choice of an ontology. According to a well-known thesis, implicit in *Principia Mathematica* but regularly associated with the authority of W. V.O. Quine, "what there is," i.e., what one is ontologically committed to, is a matter of the values over which one's variables are allowed to range. This is clear from the meaning attached to the existential quantifier ∃, which is to be read as "there is at least one x such that," committing one to the existence of at least one thing of a certain kind. Since logical transformation can, though under restrictions, lead from universally quantified statements to existentially quantified ones, the variables over which universal quantifiers are allowed to range also reflect ontic commitments. In short, the ranges of the values of the variables over which one's quantifiers extend provide one kind of primitive notion for the system. If we understand "(x) (Man x ⊃ Mortal x)" as saying that for anything, if it is a man then it is mortal, we are making use of the primitive notion of a *thing*. If the translation manual contains such expressions as

read "there is at least one thing and at least one time such that that thing occurs at that time," we are invoking times as well as things as values of our variables. Other likely candidates for values of variables include places (i.e., positions in a spatial array), events, persons, thoughts, atoms, physical objects, etc. By recognizing one or another of these as values one admits them as presumptively unproblematic parts of one's ontology.

The third kind of choice that must be made is that of the primitives of the system. A primitive notion is one which is not defined itself within the system, but in terms of which other notions receive their definitions. In order that the requirements of intelligibility be respected, primitive notions must be explicable, but their explication is not strictly part of the system itself, but rather in ordinary language. For example, in SA Goodman's basic primitive is represented as "W," standing for "with" and called "togetherness," explicated as the relation which links each pair in an experience of a color at a time at a place in one's visual field. Colors, places and times are values of variables in Goodman's system, and a color's being with a time (for example) is something that happens in our experience but is not defined within his system: we are supposed to be able to recognize that kind of experience and, through any help by discussion or pointing or whatever, be able to identify the relation intended.

In system-construction of this sort one aims at the simplest basis of primitives. This is the criterion of economy that we mentioned above, also called "simplicity." It is frequently supposed that economy or simplicity is an ancillary desideratum, only worth seeking for elegance sake after the other criteria of success have been satisfied. Goodman disagrees, and I quote.

Most generally speaking, the purpose of constructing a system is to interrelate its predicates. The same purpose is served by reducing to a minimum the basis required. Every definition at once both increases the coherence of the system and diminishes the number of predicates that need be taken as primitive. Thus the motive for seeking economy is not mere concern for superficial neatness. To economize and to systematize are the same.[6]

Goodman develops a way of comparing the relative economies of different choices of primitives by examining their relative strength as constituted by a function of their explanatory power and the number of places the predicates have. The concern for the number of places in a predicate arises because if one merely measured simplicity in terms of the number of primitive predicates a system has one could easily collapse all the primitives into a single one with an enormous number of places. Since any system can do this all systems will turn out to be equally economical. The resulting problem—of specifying just which combinations of number of primitives and number of places is preferable, which less so—turns out to be more difficult than one might have thought.[7]

Just which predicates one chooses as primitives is, of course, a function of the purposes one is concerned to serve and the nature of the domain one is systematizing, which is to say, the kinds of ordinary language statements one plans to translate. Goodman sees this choice as a possibly neverending matter of trial and error. One tries one basis of primitives, sees how far he can get by building definitions and thus finding ways of translating, until he runs afoul of one of the five sorts of criteria of success I mentioned earlier. At this point one goes back and starts again at some choice point, making a different choice of basis, trying a different kind of definition.

Having made an initial choice of primitives—and of values for the variables and a logic—one is ready to start trying to build a system of definitions. Goodman's own system has as its purpose translating ordinary statements about the physical world into a manual in which

only phenomenal predicates are used, i.e., it is a systematic way of furthering the philosophical program called phenomenalism. As we have seen, his variables range over colors, times of presentation and places in the visual field. His initial primitive is W, togetherness. In terms of W he first defines what it is to be a "quale," i.e., to be one or another of the three basic kinds of things recognized in the system—colors, times and places. Then he defines the notion of being a "complex," describable in English as an entity such that every two discrete parts of it are together. "Complex" is thus a defined term in the manual or system. From there he moves on to define a concretum as a complex that is not itself together with any quale or complex. A concretum is a color-spot-moment, that is, it is the appearance of a color at a specific time in a specific place in one's visual field. Next, he defines "(quale x) is a quality of (complex y)," and then considers ways of defining predicates of the sizes and shapes of things. And so on. The eventual aim is to be able to translate ordinary language and scientific statements such as "at 10 o'clock the 5-foot square box moved 3 feet north" into the system so constructed, in which the only primitive notions are phenomenal.

In this way the system-constructor painstakingly works away at providing answers to one or another fundamental philosophical question, or usually, a whole nest of questions. In Goodman's case the nest includes the so-called "mind-body problem" about the relation of the physical world to experience, and thus implicitly involves the entire epistemological controversy between realism and idealism. He also, at the same time, has chosen "atoms of the system," i.e., the values of the variables, which are repeatable entities (viz., qualia—colors, times, places), and another aspect of the program is to translate what we standardly speak of in terms of non-repeatable particulars, such as events, objects and such, into the language of repeatable qualia.

You may say that it seems a very difficult task to no very clear purpose. Why should one want to translate sentences about physical things into one about mental states? One way of answering is to say that one might if he wondered whether there are physical facts or things over and beyond mental ideas and sensations. To revert to the mapping analogy, it would be as if we wondered whether we need to have symbols for, say, north, south, east and west, the compass-points, on our map or whether we could dispense with directions and get the same result by having symbols for up, down, left and right on the map. We would presumably find we can't since we cannot guarantee the reader will not try to read the map upside down, so to speak. That is a rather trivial example, since it would be an odd thing to deem the notion of directions problematic and needing clarification in this fashion.

Another, and more insightful way of answering the question, is to point out that though there are things we think we know for sure about our mental life, we are by no means so confident about things said about physical facts and things, or about the relations between mental and physical things. That is to say, there are lots of ordinary statements of this sort made by ordinary people and even by scientists whose truth-value is not at all clear. Consider "nothing can be red and green all over at the same time," "every event has a cause," "my mind is in my head," and all the myriad puzzling propositions that philosophers have traditionally puzzled over. These are statements that need translating into a clarified language, if only to get rid of them in place of some statements we can confidently assign truth-values to.

Of course, a lot of statements are such that if a translation manual rendered them false we should burn the translation manual rather than change our minds about the statement. These are the statements that reflect the context of the purposes which generates

the inquiry at hand. If the manual, for example, that is constructed in order to decide, among other things, whether "nothing can be red and green all over" should be such as to make true the translation of the ordinary sentence "nothing can be red at all," we should lose interest in that manual for that purpose. This is an important point to recognize. Inquiry is always for a purpose, and the parameters of a problem are a function of the problem. Solutions to the problem must occur within those parameters.

An important and, I think, refreshing feature of the attitude of the philosophical system-maker, certainly as Goodman construes it, is its lack of dogmatism. One constructing a system should be very wary of making any unwarranted claims for his particular choices in starting a construction. The choices of logic, atoms of the system, and primitive predicates are viable only if the system that results succeeds, which is to say, only if the system so based satisfies the criteria of success that we have alluded to better than any other rival system. But the number of possible rivals that are pertinent to any given domain and purpose is indefinitely many, and there is little reason *a priori* to suppose that one set of choices is more likely to succeed than another. There is no shortcut to success in system-construction. Thus prior to actual long, hard work one does not have sufficient reason to assume that physicalism rather than phenomenalism, realism rather than nominalism, or any other metaphysical position is necessarily true. These metaphysical positions become hypotheses when viewed as choice points in system construction, tentative lines of solution which may turn out to be impossible to sustain. Thus if the purpose is to resolve the mind-body problem, say, translation of the sentences of the domain into physicalistic language is one line of solution, translation of those sentences into phenomenalistic language is another. Carnap's *Aufbau* is an attempt to work out a system which reflects the first

choice or hypothesis; Goodman's SA is an attempt to work out a system which reflects the second. Goodman gives arguments to show how Carnap's particular system breaks down, but he does not conclude from them that physicalism is bankrupt as the basis for a successful system. There are or may be other choices of basis which are physicalistic in spirit and which will succeed where Carnap fails.

This undogmatic attitude seems to me to be refreshing in that it keeps lines of inquiry open by contrast with dogmatic claims about metaphysical theses which close (or attempt to close) all lines of inquiry other than those consistent with the favored thesis. It seems especially pertinent when we consider the context in which Indian philosophy operates. Here all parties are committed to the same purpose, which we might characterize as construction of a system or translation manual into which all statements pertinent to the gaining of liberation can be translated in a manner satisfying our five criteria. Antecedent to inquiry there is no reason to suppose that realism is better suited to solving this problem than idealism, that physical-ism is preferable to phenomenalism as a base, or that nominalistic translations will work out better than realistic ones. Viewed in this perspective, the various schools of Indian philosophy represent the beginnings of the construction of systems each of which adopts different bases, i.e., makes choices of logic, atoms and primitives which are distinct from the others, but none of which have any *a priori* reason to suppose that their choices will succeed where others will fail.

II

In the *Vedāntaparibhāṣā* we find many definitions—at least 84 of them by my count. The terms defined include most of the technical terms of the Advaita school's philosophy. My project in this lecture is to suggest how these definitions can be understood as constituting a

system of the kind illustrated by the system of SA. That is, I shall suggest a choice of atoms of the system (values of the variables) and of primitive predicates from which, it seems to me, one can derive a number of Dharmarāja's definitions. I shall not derive them in precisely the order Dharmarāja presents them, nor do I claim that Dharmarāja presents them, nor do I claim that Dharmarāja himself, if he were here, would necessarily approve of the particular choices and order of things which I here propose. My point is rather that Advaita can be viewed as a systematic philosophy, and that Dharmarāja's actual definitions, whether he intended them that way or not, can plausibly be incorporated into a system of the kind I have in mind.

Why do I think this a worthwhile exercise? For one reason, because Advaita is often viewed as mysticism, about as far removed from system as one can imagine. Indeed, some Advaitins like to say that themselves about their school, that is, they like to characterize their school in anti-intellectualist fashion. There is certainly a strong flavor of this in some of Śaṃkara's writings, and one might well, reading both primary and secondary literature on Advaita, come to the conclusion that Advaita is philosophy in an entirely different sense from schools such as Nyāya and other *darśanas*, that its purpose is by negative dialectic to remove the intellectual source of ignorance which veils Brahman, which removal constitutes Self-knowledge and liberation. In much of post-Śaṃkara Advaita, however, the school is not viewed that way; rather, it is understood by its proponents as committed to the same purpose as the other *darśanas*, viz., to show us how to think about things so as to reach liberation, and this is understood as requiring a positive account of the nature of things, since "Self-knowledge" is taken to require understanding, not merely removal of a veil. To put it slightly differently, the mystical interpretation essentially thinks of Advaita as a dialectical method of

causing liberation to occur without inculcating any positive account of things to replace the mistaken notions of the other viewpoints. The nonmystical interpretation agrees that wrong views must be eliminated for one to be liberated, but avers that right views are revealed when the wrong ones are eliminated, and that these are views which form a proper part of a systematic philosophy as much as those of any other school's thought. The mystical interpretation finds the notion of system-construction repugnant, but the nonmystical interpretation has no more reason than any other school to resist systematization, and therefore has an interest in reasons for thinking its system to be comparable to, and hopefully superior to, the systems that can be developed by rival schools.

A second thing which exploring Advaita as system may do is to convince skeptics who (as I once did) feel that the Advaitin's fundamental insight, though a positive one, is not capable of consistently rigorous formulation, convince them that it does indeed support systematic development.

A third thing is to get a feel for what the organization of Advaita theory actually comes to, to bring out which notions are central and which are peripheral. The exercise of systematizing Advaita forces one to confront this sort of question.

These several things which systematizing Advaita can achieve do not actually require completion of the system for their achievement, which is a good thing since space does not allow complete reconstruction of all Dharmarāja's definitions here. It also does not require my following the text blindly: I can use a bit of imagination, or rather, I can import some insights born from the study of other systems, such as the one Goodman builds in SA.

We shall suppose that we are to systematize the insights of Advaita along the lines outlined in the previous lecture. The first

thing to do, therefore, is to propose which choices one plans to make about logic, atoms and primitives. I shall in this exposition pass over the question of the choice of logic: the logic I shall use will be standard quantification theory as set forth, e.g., in Quine's *Methods of Logic*,[8] but I hope to avoid any difficult problems of a purely logical nature. This leaves us with the choice of atoms and primitives, a choice in this case dictated to some extent, though not completely, by the terminology of Advaita and in particular of Dharmarāja himself.

I propose that we admit three kinds of values of variables, i.e., three sorts of atoms of the system. One of these is moments of time. I choose this way of handling time because to define time in terms of other notions is cumbersome, and we need to make references to times almost from the beginning: if I were to try to derive temporality from other considerations I would have no room to do anything else here. In an improved system born of a different choice it is possible times could be eliminated as values and temporality handled as a primitive or defined predicate or family of predicates.

The other two kinds of things I need to have my variables range over are "beliefs" (*niścaya jñāna*) and their contents (*viṣaya*). The strategy is to provide a means of translating all the things that Advaitins want to say about Brahman and *māyā*, levels of reality, perception and the other means of knowing, and so on into a language whose sentences are all about times and beliefs and their contents. If Quine is right, this means that provided this system is the most successful manner of representing the Advaita translation manual, Advaitins are committed to the existence of times, beliefs and contents. This doesn't, however, mean that they are not committed to other things as well. Nor does it mean that these three kinds of things are more real or more existent than others, say, Brahman. It does mean that, supposing this system is successful, the

Advaitin commits himself to these things for the purpose of talking about and thinking about things generally.

The values of our variables, then, range over beliefs, contents of beliefs, and moments of time. The third and last choice I need to make concerns the number and nature of the primitives of the system. I propose to try to make do for present purposes with three primitive predicates, each having three places.

The first predicate corresponds to the Sanskrit notion of *viṣayitā*. It is the relation which holds between a belief and its content and the time at which the belief occurs such that that belief is about that content at that time. I shall represent this as "Ajct." Thus, if at 10 o'clock a.m. on the 1st of June 1983 a certain belief J occurs which has the form "this is a pot," we can say that J is about a certain pot at that time (a content c). Notice that a "content," as here understood, is not necessarily an actual object; it is an intentional entity, what a belief is about, its content. If I am thinking of a pot, there is something—a content, that pot—that I am thinking of even though my thought may be confused or misguided and there is no pot where I think there is one.

The second primitive predicate is termed, in Sanskrit, *avacchinnatva*. It comes to the same sort of relation that used to be indicated by the Latin word "*qua*" in an expression such as "Being *qua* Being." We might parse it as the relation which holds, when I consider at a certain time t a certain thing x under a certain description y, between x and y at t, that is, that at t x is limited by having the form of y for the purpose of my thinking about it. This relation of limitation has several varieties in Advaita: it may be the case that y is an essential property of x, so that when I consider x as a y I am considering it as having one of its necessary constituent features. Or it may in another case be that x doesn't always have y,

so that by considering it under the description "*y*" I am identifying it by its having features which are not part of its nature. These differences will be defined in due course. In the symbolic renditions of my definitions which follow I represent "*x* is limited by (having the form of) *y* at *t* as "Q_{xyt}."

The third primitive predicate, which answers to the Sanskrit *āśritatva*, is a relation of being located at, or in, or on, something. For example, a belief may be located (may occur) in someone or something at a time. I shall represent "*x* is located in (at, on) *y* at *t*" as "L_{yxt}"
